The Nation.

NEW YORK, THURSDAY, JANUARY 3, 1884.

The Week.

THE reflections of the newspapers on the old year, in this city at least, are much less sentimental and much more narrative than usual, and perhaps for this reason more cheerful. It is hardly possible for anybody who has reached the age of most of those to whom the work of reviewing the year is committed in a newspaper office, to utter any reflections on it which will not be a little melancholy. There is hardly any mature person who can look on a past year without a touch of gloom. If things have gone well with him, he is sorry it is over, and doubtful whether the next will be as happy. If they have gone ill with him, it is full of painful or disagreeable memories, and has so shaken his confidence in his good fortune that he looks forward to the new year with misgiving. So that on the whole the New Year's article is hardly ever as cheerful reading as the Christmas article, which must, in fact, be essentially a hopeful and encouraging composition.

If anybody will take the trouble, however, to go back to the new and old-year articles of bygone years, he will be struck by the close resemblance which, after all, one year bears to another. It is only very rarely, perhaps not over once in twenty-five or thirty years, that an old year turns out to have been what reviewers are fond of calling an "annus mirabilis" or an "annus terribilis." The year of the French Revolution, 1789, was a wonderful year, and so was the year 1848—and by wonderful years we mean years which are perceived to be wonderful at the time, and not years in which events occur which long afterwards are perceived to have been very important. The year in which Luther nailed his theses to the church door, and the year in which the Declaration of Independence was issued, were, we now see, great years; but very few thought so then. The reason of it all is that human society, as well as Nature, does but little by leaps and bounds. The race on the whole jogs on, rather than jumps forward, and has about the same allowance of wars, earthquakes, famines, as well as gains, advances, discoveries, and inventions every year. Moreover, the events of each year are the consequences of those of the preceding year, and are therefore seldom new or startling. So that the work of reviewing a single year is one of little difficulty, and generally is but slightly instructive. It takes ten or more to make great changes visible, and show the rate at which the world goes down "the ringing grooves of change."

The San Francisco *Chronicle* has made public an interesting series of letters from Mr. C. P. Huntington, the Central Pacific Railroad millionaire, written between 1874 and 1877 to one of his managing men, whom he addresses as "Friend Colton." The correspondence is valuable chiefly as presenting with entire candor a record of transactions and suggestions relating to the world of railroads and politics such as it would probably be impossible to match. It is pity that we cannot have "Friend Colton's" letters also, to fill out the vacant spaces in the canvas. But there is enough as it stands to give an excellent idea of the political side of "railroading," and the sort of management of legislation which the power of Congress over great corporations produces. There is not a trace of shame in Mr. Huntington's letters, nor any evidence that he regards himself as worse than other men in the business. Of many of them, in fact, he has a low opinion, while he speaks of himself as occupying "high ground." Gould he declares to be "the worst man to do anything with I ever saw," and the late "Tom" Scott he criticises severely for his want of sincerity. In 1875, he tells Colton that Scott is "getting every little gathering in the South to pass resolutions favoring the Texas-Pacific bill," and making reckless promises to get it passed. At this he is naturally indignant, but his fertile mind at once suggests a way of blocking Scott's wicked plot, as follows:

> "If we had a franchise to build a road or two roads through Arizona (we controlling, but having it in the name of another party), then have some party in Washington to make a local fight, and asking for the guarantee of their bonds by the United States, and, if that could not be obtained, offering to build the road without any aid, it could be used against Scott in such a way that I do not believe any politician would dare vote for it. Cannot you have Safford call the Legislature together and grant such charters as we want at a cost of, say, $25,000? If we could get such a charter as I spoke to you of it would be worth much money to us."

The Huntington–Colton correspondence, as far as published, brings Mr. Huntington's operations in Washington down to 1878. It unquestionably puts in the shade everything of the kind that had appeared before. Jay Gould, whatever he may have done, or have been suspected of doing, has taken considerable pains to leave no record of his dealings with lobbyists, legislators, or Congressmen "to leap to light"; and when we recall the indignation and astonishment of the country over the Crédit-Mobilier exposures, the long investigation which followed, and the ruin which seemed to overtake the Congressmen who were found guilty of receiving stock dependent for its value on their votes, it seems as if that not very remote period must have been one of pure Arcadian simplicity and probity. The Huntington letters show, in fact, that the Crédit Mobilier served as a sort of cover for his operations. Public indignation at corruption and corruptionists cannot be kept alive very long; it exhausts itself, and is followed by a reaction, a period of indifference and lassitude, by which men of real nerve, like Mr. Huntington, profit. Something of the same sort is believed to have occurred in this city after the movement against the Ring, when certain residuary legatees of Tweed continued, as reformers, the plunder which they had begun in a different capacity. In somewhat the same way Mr. Huntington was all the better able to carry on his business in Washington, because the reserve of public indignation has been exhausted, and a considerable period of time must elapse before exposures of any kind would be likely to again awaken much interest.

The struggle between Scott and Huntington was long and fierce, and in these letters we see exactly how they must have looked upon the agents they employed or suspected each other of employing. Huntington reviews the California delegation, speaks of one member as a "good fellow," and "growing every day," of another as a "scavenger" and "hog," and declares that the latter must "be defeated at almost any cost." Another he speaks of as a "wild hog," in 1875, but in 1876 asks that he be sent back to Congress, there having evidently been a good deal of "growth" in the meantime. In one of his letters he tells Colton that Scott has "switched" (*i. e.*, off the Huntington and on to the Scott track) Senator Spencer, of Alabama, and Walker, of Virginia, but adds consolingly, "you know they can be switched back with the proper arrangements when they are wanted." Free passes cut a great figure in all the arrangements; indeed, Mr. Huntington's faith in the efficacy of passes is quite as great as has ever been expressed by their most extreme opponents. In a letter written in 1876 he asks: "Is it not possible to control the agent of the Associated Press in San Francisco?" "Scott," he continues, "has a wonderful power over the press, which I suppose he got by giving them free passes for many years over his roads." The letters furnish a picture of legislative railroad business such as we have not had since the Crédit-Mobilier exposures, but it is not as an exposure that it is chiefly important. The means taken by Huntington to get legislation are forced upon men who are in his position by the character of the agents through whom they act; and the real lesson of such revelations is the frightful state to which we should be brought by any further extension of the power of Congress, or the "hogs," "wild hogs," and "growing" men in it, over the railroad system of the country.

Speaker Carlisle displays unnecessary nervousness over the Republican attempt to show that he has "organized Congress in the interest of the solid South." The composition of the committees shows that he has done nothing of the kind, and the charge can safely be left to die of its own weakness. A much more serious matter for the Speaker to explain is his composition of the Committees on Banking and Currency and on Coinage. The latter committee is about as badly constructed as it could possibly be. Mr. Carlisle not only put Mr. Bland, the originator of the silver-dollar act, at its head, but gave him five members who share his views, thus securing a majority who are known to be in favor of continuing the coinage of silver, and of forcing it into circula-

tion by withdrawing the one and two-dollar greenback notes. At the head of the Banking and Currency Committee he placed Mr. Buckner, of Missouri, one of the most hopelessly unsound of the greenback statesmen. If Mr. Carlisle can explain these appointments satisfactorily he will do his party a great service. As they stand, they confirm the prevalent impression of the Democratic party's indisposition, or inability, to deal intelligently with financial questions; and this impression is likely to cost them a great many more votes than the nearly defunct sectional issue.

Mr. Bland, the Chairman of the Committee on Coinage, Weights and Measures, has apparently, unlike Mr. W. D. Kelley and others, lost none of his faith in the great silver idea. Most of his old co-laborers have seen the error of their ways, and wish to stop coining silver, but he wants to coin more than ever. Not only would he add the trade dollars to our existing circulation, but he would start a new mint in the Mississippi Valley—say at St. Louis—so as to give the West a fair share of the good things that are going. This is all the pluckier because the old silver-men's argument that we were going to be ruined for want of silver money has been destroyed in a most crushing manner during the last three years. If we had since 1879 been running on a single gold standard, the prolonged depression in trade would have kept scores of silver prophets writing bi-metallic pamphlets, and lifting up warning voices about the danger to business of reliance on gold. But we have had such a grand period of depression under the double standard, and with our vaults and drawers choking with the fathers' dollars, that a deep silence has settled on most of them, and the others are asking to have the past forgotten, and be allowed to live in peace for the rest of their days.

The interview reported Friday morning between Mayor Harrison of Chicago and some of the business men of that city—whose standing, however, does not appear—reads like a scene from the opéra bouffe. They asked him to stop the police from making raids on gambling houses in a certain locality, on the ground that the closing of the gambling houses would seriously affect the retail trade in the neighborhood, because the gamblers "made the business lively." The Mayor declined to comply, on the ground apparently that the frequenters of the gambling houses were boys and workingmen. We suppose this is one of the numerous signs of the badness of the times. The retailers, in their distress, are ready for anything which is likely to work off their goods.

There is another sign very like it, namely, the enormous number of fires, particularly in those branches of trade and manufacture which are most depressed. We believe it is a fact that the claims on some insurance companies in this city, during the past month, have been larger in amount than ever before, except after such exceptional calamities as the burning of Chicago and Boston and Portland; and they have come from the trades which are now most distressed, in such numbers as to make it appear as if arson was often the last resource of the distressed trader. That a model tariff which was to make such crises as that through which we are passing—not a sharp panic, but a prolonged and dreary depression—impossible, should end in that way after twenty years' trial, is most disappointing. The country, as far as one can see, might just as well have been running under a tariff for revenue only or any other hideous device of the free-traders. Business could hardly, under the worst scheme of the Cobden Club, have been brought to so low a pass as to need the aid of gambling houses and incendiary fires.

The State Convention of Ohio liquor-dealers have adopted a series of resolutions declaring unequivocally that the "Scott law is in direct violation of the wise provisions of the Constitution of Ohio," and that in their opinion it ought to be repealed by the Legislature. This brings them in direct conflict with the Supreme Court of the State, which has decided that the law is constitutional, and a division of judicial opinion is created which can be little less than painful to every patriotic citizen of the State. The chances are, however, that the decision of the court will be considered the more binding of the two. There is nothing for the liquor-dealers to do in this event except to secure the election of some of their own men to the bench. In this city, for example, the Liquor-Dealers' Association has for its President a member of our Board of Aldermen, and as the membership of the two bodies consists largely of the same men, there is little danger of a conflict of opinion between them.

The New Jersey Labor Congress has framed a prison-labor law which probably represents fairly the demands of all the non-convict interests on the subject. It provides that no more than twenty prisoners shall be employed in any one branch of business, and that a board consisting of two workingmen, two "business men," and one "merchant," with the warden as advisory member, shall fix the price of all products so as to prevent the convict-made goods from going on the market at less than market rates. There is a difficulty in the convict-labor problem which no legislative machinery can meet. As long as convicts are employed in industry of any kind, and the products disposed of for what they are really worth, the market for the goods they produce must be affected by it at some point. The Labor Congress recommends that as many prisoners as are necessary shall be employed in producing articles for State use; but if the articles are really needed by the State, then the State will only get them directly from the prisons, instead of going into the market for them. But this withdrawal of the State as a purchaser would in so far tend, by a decrease of demand, to lower the price of the article; so that the final effect on wages and prices would be pretty much what it was before.

The Hebron church discussion over the conduct of its clergyman, in aiming a sermon on "Polygamy" at the head of a member who had been divorced from three wives and was living with a fourth, has resulted in the discomfiture of the clergyman. The church has adopted a report censuring him for improper conduct, and declaring him deserving of a "reprimand." When this action had been taken the polygamous member arose, and said that he was so delighted with the handsome conduct of his brethren that, if they would go a step further, and by a unanimous vote declare him a member in good standing, he would move back into town, and, like a good Christian brother, withdraw the suit for slander which he had begun against his pastor as a "liar and a hypocrite." The vote was passed, and everybody was made happy except the minister, who was not present. It is believed that the "rebuke" is so severe that he will be obliged to "go."

President Taylor, who discusses the Mormon question with Governor Murray in the current number of the *North American Review*, makes some good points for the Mormons, though the main interest of his remarks lies in the calm and temperate tone with which he discusses the matter. He mentions a curious fact with regard to the Edmunds Act, which seems to merit attention from Congress. The Act provides that no polygamist, bigamist, nor "any person cohabiting with more than one woman," shall have the right to vote in Utah. The Commissioners under the Act, however, in the test-oath which they introduced, required the voter to swear that he *had never* simultaneously lived with more than one woman (thus giving the law a retroactive or *ex post facto* effect) "in the marriage relation." Laws of this sort are always strictly construed by the courts, and to make this one apply to past acts, and to except from it all persons cohabiting without going through the form of marriage, is going to the opposite extreme. No great moral movement is likely to be much helped by such distortion of the law as this. Again, Mr. Taylor very justly complains of the disposition among the Gentiles to confound polygamy with the crime of bigamy. The wickedness of bigamy does not mainly consist in the act of marrying two women, but in the gross fraud and deception practised on the second wife. In other words, the second wife does not marry voluntarily. This is, to be sure, only a different way of putting the argument that plural marriages are unobjectionable because the women like them, and know beforehand that a number of wives is a part of Mormon family life.

The *Tribune* on Monday tried to console the manufacturers over the existing depression here by pointing out to them that France and England are suffering from it too, and maintained that in all these cases the cause is the same, namely, overproduction. But how does this tally with the orthodox doctrine that whatever goes wrong in a free-trade country is due to free trade, and that whatever goes wrong with a protectionist country is due to the fact that the tariff

is not high enough? Several high-tariff men in the United States hold this view so strictly that they even ascribe the decline of the Ottoman Empire to low duties on imports. Surely, under these circumstances, it cannot be true that the Yorkshire and Lancashire manufacturers are closing their mills and blowing out their furnaces for the same reason that is producing these same phenomena in Pennsylvania and New England. The time has come for the high-tariff men to get up a really water-tight theory, that will float in any weather, and bear collision with every class of facts. Every good Protectionist should be able to tell at a moment's notice what ails him if he is not feeling very well.

After all the discussions of the currency problem during the last twenty years, it is rather disheartening to find a gentleman of Mr. Jackson S. Schultz's clear-headedness and long business experience declaring, as he does in the *Journal of Commerce*, that "although a hard-money man, he could never understand why the paper circulation should not have been issued by the National Government instead of by private corporations. By law the Government is made responsible for the security of the bank notes. Why then should not the Government reap the advantages of that circulation?" He added that he did not think "that among the majority of business men there were two opinions on that question." This subject was thoroughly and, it seemed then, exhaustively discussed in 1873 after the panic, when the Government was so urgently pressed to come to the relief of the business community by the reissue of greenbacks. Mr. Schultz's remarks seem to show that the greenback movement is so completely dead that even men who follow the political discussions of the day with close attention, like Mr. Schultz, have forgotten the arguments by which it was successfully resisted. The principal of these arguments was that to charge the Government with the duty of issuing paper currency was substantially to ask it to engage in the business of banking on an immense scale. This is really what Mr. Schultz now calls for, though his own object is concealed or disguised, even to himself, by the phrase, "Why should not the Government reap the advantages of the circulation?"

The paper circulation is not, however, primarily or mainly designed either for the advantage of the banks or the Government, but of the public, and the reason why the issue of paper money is left to the banks by all solvent governments is, that it is only through banks that the exact amount of paper money the country needs can, in commercial communities, be properly ascertained. Banks can only put out as much currency as business men call for; as soon as they put out too much it comes back on them, either in the shape of deposits, or demands for redemption, or in the falling off of applications for discounts. If the Government were to issue the paper money without doing a regular banking business of deposit and discount, the amount of circulation needed by the country would have to be determined either by the votes of Congress or by the simple fiat of the Secretary of the Treasury. Of the fitness of Congress to determine what the proper volume of the currency ought to be, we need hardly speak. To allow the Secretary of the Treasury of his own notion to make money tight or easy is something which, we believe, even the Greenbackers have never proposed.

It is evident that the question of the purchase of the Adirondack region will enter early into the discussions of the Legislature. Unusual interest is shown in the matter in all parts of the State. The question of State ownership involves State supervision and careful guardianship against fires and still-hunting. The objection which has been raised in some quarters, that it will be expensive business for the State to purchase the lands because the owners of them will demand exorbitant prices, is disposed of by the fact that the State can take them by the right of eminent domain, on the payment of a fair price. Senator Warner Miller, in a recent speech, recommended the appointment of a Forestry Commission of scientific and practical men to whom the Legislature can refer the whole subject and on whose recommendation it can act. This Commission can first investigate and decide upon the necessity for the State to purchase more of the lands than it holds at present, and afterwards decide upon the best means for preserving and supervising the lands. Such a Commission, if rightly constituted, would undoubtedly be of great service. It would, at least, enable the Legislature to act intelligently.

The Civil-Service Commissioners of this State have got over the difficulty about the mode of promotion, in their 31st Rule. This difficulty, as has often been pointed out, lies in the fact that if you leave promotion wholly to the discretion of heads of departments or of bureaus, you open the door to favoritism and to the use of political influence. If, on the other hand, you make it dependent on competitive examination, you diminish the responsibility of the chief, and enable him to excuse shortcomings in his office by saying that he could do no better with the employees which the new system had put into high places. The New York Commission has managed, however, to give reasonable play to his discretion by providing that while, as a rule, vacancies in the higher grades shall be filled by the promotion of those in the lower grades of the same subdivision by competitive examination, yet if, in the judgment of the officer or officers having the power of appointment, there is no fit person to be found in the lower grades, the vacancy may be filled by competitive examination among outsiders. Moreover, promotion is in all cases to be based on the positive merit of the person promoted, and upon his superior qualifications as shown by his previous service; and proper comparative records are to be kept, in every department, office, and institution, "of the efficiency, punctuality, and general good conduct of all persons employed therein."

The 33d Rule also provides, following in this the example of the English service, that a recommendation for promotion emanating from any one but the candidate's official superiors, in the regular course of duty, shall be considered an unwarrantable interference with the public service, and the candidate may be required as a condition of promotion to show that the recommendation was not made at his request or by his connivance. Another excellent provision is to be found in the 34th Rule, guarding against an evasion of the law which has already made its appearance at more than one point in the Federal service. We mean the appointment of persons for "temporary employment," who are unable to pass the examinations necessary for permanent employment. This is sometimes simply a mode of getting workers into the service who do not possess the necessary qualifications, and of course, once in, means are readily found not only of retaining them permanently, but of promoting them. The New York rule forbids absolutely the temporary employment of anybody who is not fit for permanent employment, except that in prisons, reformatories, and asylums, temporary substitutes may be appointed for not exceeding thirty days, in case of disability through sickness or otherwise, and such temporary appointments can be made only once. The working of the New York rules will be watched with all the greater interest because unpleasant stories are afloat about evasions of the Federal law, which seem to indicate, if true, a want of good faith and sincerity in its administration on the part of people in high places. Such evasions are signs of bad politics as well as bad morality, for in this State, at all events, nothing is more certain than the popular determination that the law shall be obeyed, and that playing tricks with it shall be punished.

The Mahdi is now reported as "marching on Khartum," and likely to get there about the 4th of January. Mr. John Morley, in addressing his constituents in England, urged the Government to withdraw from Egypt promptly, and said the Mahdi would not invade Egypt because of the distance and the unwillingness of his wild followers to leave the desert. But the *Spectator*, which hates to give up the Mahdi as a great modern wonder, maintains that this is all wrong, because "Oriental armies cross vast distances, and Arabs, as far as known, will go anywhere for plunder." Oriental armies have in bygone times traversed immense distances, under the "Almoradives" and "Almohades," for instance; but the Oriental problem to-day consists almost wholly in the fact that Oriental armies will not do now what they once did. If they would, the Sultan, the Shah, and the Great Mogul would still be the terrors of Christendom. Moreover, Arabs nowadays, no matter what their former state of mind may have been, will only "go anywhere for plunder," if they think they will get there. What dampens their zeal in our time, is the abundant experience they have had of the difficulty of getting to the places where the plunder is without being killed on the way.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, December 26, 1883, to TUESDAY, January 1, 1884, inclusive.]

DOMESTIC.

SPEAKER CARLISLE'S Congressional committees have given pretty general satisfaction in his own party, though a number of malcontents have been reported. Mr. Morrison, Chairman of the Committee of Ways and Means, is reported to have said to a gentleman who suggested that the composition of that committee evidently indicated that the Democrats would make the tariff the issue in the Presidential campaign: "The issue is not to be avoided and it is welcomed. The Republicans have invited this contest in the call of their National Republican Committee, and we cheerfully accept it. It is the issue upon which we shall go to the people in the Presidential campaign of 1884, and upon which we expect to win. But if the protection Democrats shall choose to unite with the Republicans, it will not be possible for us to pass a bill even through the House." This programme, it is said, will meet with opposition from the high-tariff Democrats, and there are some who predict a serious split in the party in Congress.

Mr. Randall, who is at the head of the Appropriations Committee, proposes to proceed with the appropriation bills as rapidly as possible, and to have an early adjournment of the session.

Mr. Abram S. Hewitt on Saturday published an open letter in the Albany *Argus* urging the necessity for tariff reform. He concludes as follows: "The Democratic party proposes to open the way to freer markets, fuller trade, and better wages, by abolishing the duties on raw materials, and removing the purely obstructive features of the tariff. If the Democratic House shall frame and pass a judicious measure of revenue reform, carefully adjusted to the actual condition of our suffering industries, and the Republican Senate shall refuse to concur, the issue will be fairly joined. The people can then decide whether the do-nothing party now in power shall be replaced by an administration which will remove the artificial barriers to healthy progress."

The publication of the list of Government pensioners has resulted in 10,000 applications for increase and only one discovery of fraud. The list was printed at a cost of about $55,000, and has not accomplished a saving of thousands of dollars to the Government.

The statistician of the Agricultural Department has completed preliminary estimates of the crops of the country for the year 1883, which show that potatoes, as well as all other roots, and oats have yielded abundantly. The average yield of corn for the year is nearly 23 bushels per acre, or a total of 1,551,066,835 bushels.

The commercial agent of the United States at Nottingham, England, has made a report to the Department of State showing that the exports from that district to the United States for the year ending Sept. 30, 1883, were valued at $8,381,570, a decrease of more than one million over last year. The decrease of exports of lace goods was $2,037,942, but there was an increase in almost every other article. The increase in hosiery was $434,572.

The United States Consul at Sheffield, England, reports that the total amount of trade with the United States for the year ending September 30, 1882, was $6,217,748. The total for the year just closed is $3,947,767, showing the large decrease of $2,269,981. This decrease occurs principally in the two items of steel and Bessemer rails, the falling off in the former being $205,549, and in the latter, $1,750,185.

There has been an improvement in the Maine ship-building industry this year. One hundred and seventy-four vessels have been built against 168 last year. The aggregate tonnage was less.

The vigorous canvass for the Speakership and Clerkship of the New York Assembly was practically closed on Monday night by the Republican caucus, which nominated Mr. Titus Sheard, of Herkimer Co., for Speaker. An effort was made to have the nomination made *viva voce*, but was defeated—47 to 25. Mr. Littlejohn, of Oswego, then withdrew from candidacy in favor of Mr. Sheard, and Mr. Erwin, of St Lawrence, withdrew in favor of Mr. Roosevelt, of New York. Mr. Sheard was nominated over Mr. Roosevelt by a secret ballot of 41 to 29. Mr. Sheard is considered to be an able man with a clear record. Mr. Roosevelt represented the Young Republicans who led the revolt against the Machine in the last Legislature. Mr. Chickering, of Lewis Co., was selected for Clerk, and other minor offices were filled with nominees. The Democrats nominated Assemblyman Rice, of Ontario, for Speaker. The Republican Senatorial caucus nominated Mr. McCarthy, of Onondaga, for President pro tem. of the Senate. The Democratic nominee was Senator Jacobs. Tammany Hall was refused even the empty honor of the Democratic nominee for the Clerkship.

The Legislature of 1884 was formally opened at 11 o'clock on Tuesday morning. In the Assembly the caucus nominees of the Republicans were all elected. Mr. Sheard, in assuming the office of Speaker, said: "It is not for me to attach any significance to your choice of a Speaker, but I am at liberty to so far construe it in accordance with my own convictions as to believe that it means the determination of the majority of this body that no legislation of doubtful character, of questionable expediency, of extravagant tendency, or of purely partisan, selfish, or personal end shall pass unchallenged. In my capacity as your presiding officer, I shall deem it my duty to exert whatever power the chair legitimately possesses to check any legislation which may be fairly construed as contrary to the best interests of the whole people."

The new State Senate was addressed by Lieutenant-Governor Hill, who delivered a eulogy on the last Democratic Legislature. The Republican caucus nominees were then elected.

Governor Cleveland's annual message, which was read in both houses soon after their organization, is a very long document, summarizing the present condition of State affairs. He appeals to the Legislature for persistent work and argues against local and special bills. It is shown that the total State debt, on September 30, was $5,978,301.81, the reduction during the year $407,054.49, the available surplus at the beginning of the fiscal year $4,249,567.97, and that an extraordinary reduction in the tax-rate can be safely made for the coming year. The Governor believes that the burdens of taxation could be greatly lightened by placing real and personal property on the same footing, and abolishing all deductions for debts. The Governor believes that the free-canal system has been justified by results, and he would approve a system of constant and gradual repairs. He recommends regular stated examinations of savings banks, advises the purchase of the military camping ground at Peekskill, the appointment of a State Superintendent of charitable and reformatory institutions, the prompt execution of the law passed at the last session for reconstructing the Emigration Board, the attachment of the health officers at this port to the Quarantine establishment at a fair salary, the abolition of the office of the harbor-masters and the transfer of their duties to the Dock Department, the supervision of corporations, and the prompt completion of the new Capitol. Measures for preserving the Adirondack wilderness are suggested, but the wholesale purchase of those lands by the State is opposed.

The New York State Senate Committee on the Preservation of the Adirondack Forest will report against the purchase of the woodland in bulk by the State. They find that this would result in an enormous job, and that the price of land almost worthless would be run up to $100 an acre. They say the State is rapidly acquiring the land through non-payment of taxes.

The Board of Estimate and Apportionment of this city, in considering the city budget on Thursday, reduced the estimates for the Department of Public Works by about $500,000, and the estimates in the Park Department by $135,000.

Commissioner Hubert O. Thompson, of this city, on Thursday evening sent to Mayor Edson a long reply to statements published in the *Tribune* concerning the alleged mismanagement of the Department of Public Works. He asserts that under the opinions of the Corporation Counsel he had no choice but to accept "unbalanced bids." He thinks it is not surprising that mistakes were made in estimates, and holds that experienced contractors can make better estimates than any engineer. He states that the percentage of actual cost over estimated cost for the total of contracts made during his administration is extremely small. The practice of granting $999 orders he defends as legitimate and in the interest of the city.

General Grant, while alighting from a coupé, at his residence in this city on December 24, slipped and fell on his left side, sustaining a serious injury in the leg, about four inches below the hip-joint. The surgeons say that no bones are broken, and the supposition is that a bruise of the sciatic nerve has been sustained. He will be confined to the house for some time.

The testimony for the defence still continues in the Feuardent Cesnola case. Among the witnesses during the week was William C. Prime.

A State Convention of Colored Men was held in Columbus, Ohio, during the week. Resolutions were adopted to petition the Legislature to pass laws for their protection; to repeal all the old statutes against them; to improve the facilities for the education of colored youth, and asking both State and national aid for colored schools; recommending coöperation among colored people by the formation of joint-stock companies in business, and taking steps for the formation of civil-rights leagues. A similar convention was held at Norwich, Connecticut, on Thursday.

A State Convention of Ohio Liquor Dealers, held at Columbus on Thursday, adopted a resolution requesting the Legislature to repeal the Scott Liquor Tax law, and to enact "a judicious and constitutional law" in its place.

The biennial session of the Socialist Labor Congress met in Baltimore on Wednesday and continued in session three days.

Four negroes in jail at Yazoo City, Miss., for killing the Posey brothers and young Nicholls were lynched by an armed mob on Saturday evening. Two of them were hanged and two were shot.

A severe gale did considerable damage in New England on Thursday. It was preceded by a thunder shower.

Brigadier-General Mackenzie, the Commander of the Department of Texas, has been relieved of his command temporarily because afflicted with serious mental trouble, occasioned by nervous prostration.

The wife of General W. S. Rosecrans, of California, died in Washington on December 25.

Brigadier-General Andrew A. Humphreys, U. S. A. (retired), died suddenly at his residence in Washington on Thursday night, about 10:30 o'clock, from an attack of angina pectoris. He had a brilliant record both military and civil. He was especially conspicuous for bravery at Gettysburg. He held the

office of Chief of Engineers from 1866 until his retirement in 1879. Several military and historical books have been published from his pen.

Mr. Joseph Longworth, one of the wealthiest citizens of Cincinnati, died on Sunday in his seventieth year. He founded the School of Design in that city, giving it $100,000.

George W. Lane, President of the Chamber of Commerce in this city, died on Sunday morning at the age of sixty-five. He was a prominent citizen, and trustee of many important institutions.

The Rev. Dr. Benjamin Nicholas Martin, Professor of Logic and Intellectual and Moral Philosophy in the University of the City of New York, died on Wednesday, at his home in this city, aged sixty-seven. He was the author of many theological essays and of several books.

By the will of George Oakes Clark, of Milton, Mass., his estate, valued at $300,000, is left in trust for the benefit of his family, and after their decease and that of all his relatives the remaining portion of the estate is bequeathed to Harvard College.

The will of Professor Sophocles leaves the bulk of his estate, valued at about sixty thousand dollars, to Harvard College, to be kept as a permanent fund, and called the Constantius Fund, in memory of his uncle, applying the income in two equal parts, one to the purchase of Greek, Latin, and Arabic books for the College, and the other to publishing the catalogue of the College library.

A despatch was received from Hanover, Germany, in Albany, on Thursday announcing that Col. Henry R. Rathbone had shot and killed his wife and then attempted to commit suicide. It is probable that he may survive. The deed was committed while he was suffering from melancholia. Mrs. Rathbone was a daughter of United States Senator Harris of Albany, and Colonel Rathbone was a cousin of ex-Adjutant-General John F. Rathbone. Colonel Rathbone and Miss Harris were present in the box at Ford's Theatre with President Lincoln the night of the assassination. Colonel, then Major, Rathbone attempted to seize Wilkes Booth, and was severely wounded in the arm by the dagger of the assassin.

FOREIGN.

It was reported in Paris on Thursday that the French Government had urged Admiral Courbet to follow up his victory at Sontay with the utmost promptness. It is expected that he will make an attack upon Honghoa, some twenty miles above Sontay, before he marches his forces against Bacninh. It was rumored on the Bourse, on Friday, that a French force had landed upon the island of Hainan, which is opposite the mouths of the delta of the Red River, and commands the Straits of Hainan, through which all commerce via the Gulf of Tonquin passes to Hong Kong. The rumor was not confirmed. On Saturday it was also rumored that China, acting under the advice of the European Powers, had withdrawn her troops from Bacninh.

The London *Times* on Monday asserted that it had the best authority for saying that China wants peace, and that if France will return to her original policy in Tonquin, and abstain from further hostile action on the Red River, a pacific agreement is almost certain; and that China will abate some of her first pretensions if France will show a conciliatory spirit. The *Times* added: "The rejection by the French of these offers must result in the triumph of the anti-foreign party in Pekin. China's desire for peace being sincere, the Powers interested should offer their mediation collectively."

A scheme for the revision of the French Constitution as prepared by M. Ferry, Prime Minister, chiefly aims at the abolition of the office of Life Senator and the restoration of the *scrutin de liste* system of voting. It is believed that the party of the Right will support the latter proposition.

A decree prohibiting the importation into France, except at three specified ports, of American salted meats was published in Paris on Saturday. Marseilles, Havre, and Bordeaux are the three exceptions. All importations of hog meats were absolutely prohibited after January 20, 1884.

The anniversary of the death of Gambetta was observed in Paris on Monday. A memorial tablet was erected at his residence at Ville d'Auray, and wreaths were deposited upon his tomb at Nice.

Jean Baptiste Cicéron Lesueur, a French architect, and member of the Institute, is dead. He was born in 1794. About 1840 he took part in the enlargement and completion of the Paris Hôtel de Ville. He was a professor in the School of Fine Arts in that city in 1852.

The supporters of Señor Sagasta, who form a majority in the Spanish Chamber of Deputies, are more than ever opposed to the programme of universal suffrage and reform of the Constitution. The rupture between the different Liberal groups is complete. On Monday it was telegraphed from Madrid that Gen. Lopez Dominguez, the Spanish Minister of War, having insisted that the reply of the Cortes to the speech from the throne should bind the Liberal majority to approve of universal suffrage, the revision of the Constitution, and a dissolution of the Cortes, conciliation had broken down and Señor Sagasta had the Cortes and the country with him.

A decree was gazetted in Madrid on Thursday abrogating Article 5 of the decree of the 12th of March, 1868, whereby goods from the United States pay duty in Cuba as if they had been brought in foreign ships, even when arriving under the Spanish flag.

Intelligence was received in this country on Thursday of the arrival at Oporto, Portugal, of fifty-three men who were on board the Belgian steamship *Plantyn*, which sailed from New York November 11 for Antwerp, and had not since been heard from. The vessel was disabled by a hurricane on November 17, but was kept afloat until December 6 by hard work at the pumps. On that day the passengers and crew were rescued by a British brig.

King Humbert of Italy has consented, in accordance with the wishes of the Pope, to erect the proposed tomb of the late King Victor Emmanuel in a side chapel of the Pantheon at Rome, instead of in the centre of the structure.

The American Bishops remaining in Rome deny that any agreement has been arrived at by them concerning the attitude of the Catholic clergy of the United States toward Fenianism.

A commission which has been sitting for many months preparing a reform of local administration for Russia has completed its task. Count Tolstoi, the Minister of the Interior, however, opposes its conclusions so strongly that a conflict between the Commission and the Minister has arisen, and the Emperor has been appealed to.

Lieutenant-Colonel Sudeikin, of the Russian Gendarmerie, was enticed into the Rathoff building near the Moscow Railway station, on Friday night, by false information that a Socialist meeting was to be held there, and was then killed by several Nihilists. A despatch says: "The assassination had a most depressing effect on the Czar, who was on the point of making constitutional concessions, but is now said to be firmly resolved on the most stringent and unbending measures." It is believed that the murderers were agents of Sudeikin who were secret Nihilists. They left letters behind saying that their next victims would be Count Tolstoi and General Gresser, chief of the St. Petersburg police.

There appears to be a revival of attempts to destroy life and property by the use of explosives. There was an explosion at Birkenhead, England, on the night of the 25th, and a dynamite cartridge was exploded in Barrack Street, Strabane, Ireland, on Wednesday, destroying the roof of a house.

About 20,000 people attended the meeting of Orangemen at Dromore, County Tyrone, on Tuesday, and about 2,000 people attended the Nationalist meeting at the same place. At the Orange meeting the Government was accused by the speakers of endeavoring to secure the Parnellite vote by prohibiting loyal and allowing Nationalist meetings. Resolutions were passed opposing home-rule in Ireland. The usual speeches supporting the objects of the League were delivered at the Nationalist meeting. Large bodies of cavalry, infantry, and police kept the rival parties separate during the speaking, but at the close of the meetings a collision occurred. A serious fight was waged between the two parties for some time, during which the cavalry and infantry charged several times. Revolver shots were exchanged, stones were thrown, and sticks were freely used. The fight ended only after the hussars and lancers had charged across the fields and wounded a number of Orangemen. The infantry, with fixed bayonets, escorted the Nationalists beyond the reach of the Orangemen.

A reunion of representative Scotch-Irishmen will be held at Belfast, Ireland, on July 4, 1884, at about the time of the Pan-Presbyterian Council.

A bill drawn by Mr. Justice Ilbert, and designed to give the same authority and jurisdiction to native judges in India, under the Criminal Jurisprudence Act, as have been and are now exercised by English judges, has created much comment and opposition among the European residents. They declare that it will create race antagonism. The native press oppose any compromise on the bill. The London *Times* has editorially condemned it.

Mr. Charles Bradlaugh, Member of Parliament for Northampton, England, announces that it is his intention to go to the House of Commons on the day of the opening of Parliament, the 5th of February, alone, and do his best to take his seat.

Heavy failures were reported from England on Monday. Among them were Alexander and Henry Brogden, iron masters, but not partners, whose liabilities aggregate more than $7,000,000. Ten minor failures in the iron trade were reported in Birmingham on Tuesday.

Mr. Lowell has decided to resign the Lord Rectorship of St. Andrew's University, the technical objections to the office being held by a foreign minister proving more formidable than he anticipated. The resignation is offered to relieve the authorities from the necessity of deciding the points that have been raised.

It was reported in Cairo on Wednesday that El Mahdi was advancing with his forces from El Obeid, and was expected to reach Khartum in ten days, but later advices alleged that El Mahdi had gone to attack Sennaar, and that he intended afterward to attack Khartum and then consolidate his forces and march northward.

The Haytian Minister to the United States has received the following despatch from his Government: "Jeremie has capitulated, and advises Jacmel and Miragoane to do the same. Miragoane has asked to capitulate."

A formidable riot occurred at Harbor Grace, Newfoundland, on Wednesday evening. The Orangemen of the city turned out in procession, with their regalia and flags, when they were attacked by the opposite faction, and five men were instantly killed and eighteen mortally or severely wounded.

MR. HEWITT ON TARIFF REFORM.

THE admirable letter which Mr. Hewitt has sent to the Albany *Argus* is the first clear and intelligent effort that any Democratic leader has made to define the present attitude of his party on the question of the tariff. There is no quibbling and no dodging in it. Mr. Hewitt was asked to give his views of the causes and the effect of the present depression in the iron industry, and the relation of that depression to existing tariff conditions. He responds frankly that the depression is largely due to the fact that the war tariff imposed higher duties than were needed for protection, thus giving excessive profits to the manufacturers in a period when the profits would have been large enough without such high protective duties; and that we are now suffering from the unnatural stimulation which the trade thus received. Starting from this general position, Mr. Hewitt gives expression to his views on the whole question of tariff legislation, and states his position with a clearness and force which ought to have a bracing effect upon the timid majority of his party, who seem to think that the only way to meet the tariff issue is to demand a "tariff for revenue, with incidental protection," and then explain that they don't really mean anything by that. Mr. Hewitt, speaking not only as a Democrat, but as one of the largest iron manufacturers in the country, says the lesson to be derived from experience is that the duties on all kinds of iron should never exceed the lowest possible point which, in time of depression, will protect the domestic market from a flood of foreign iron. "Such rates of duty, provided they are specific, will, on the average, yield the largest amount of revenue, because, when the price rises and the producer no longer needs protection, the consumer, who does need protection, can then supply his wants at a fair price in the foreign market without paying an increased duty, if he cannot get equally fair terms at home."

Passing from the iron industry to all industries, he says that the reduction of extra-protective duties to a reasonable standard of specific duties is the only practical means of avoiding an unhealthy expansion of business when it is active. "Extra-protective duties," he declares, "merely result in over-production, in the general derangement of industry, and in consequent suffering to workingmen by the loss of employment and the reduction of wages." On the point of wages in their relations to the tariff Mr. Hewitt's letter contains a few luminous and sound observations which sweep away completely the fallacious protectionist argument that high duties are always accompanied by high wages, and that low duties mean a reduction of American laborers to the level of the "pauper labor" of Europe. If other Democratic leaders would make Mr. Hewitt's arguments their own and use them fearlessly at all times, it would be a good deal more difficult for the protectionists to "fool" the workingmen on this point hereafter. The protectionists had a partial success with this issue in 1880 only because the Democrats were afraid to argue it with them; even then that success was so artificial that if the campaign had lasted a month longer it would have almost entirely vanished by election day.

Concerning the policy for his party to follow, Mr. Hewitt is specific and straightforward. So far as relief can be provided by legislation, he says the remedy must be found, "first in freeing raw materials from all duties, and, secondly, in imposing rates of duty on manufactured products not more than sufficient to make good the difference in the amount paid for labor, in the production of any given article in this country, as compared with the amount paid for the same labor in other countries with which we compete. For this purpose the incidental protection afforded by revenue duties will, as a rule, be found sufficient when any protection is needed." This he lays down as the Democratic programme, and endeavors to pull his party up to its performance by advancing strong arguments in favor of a manly policy as being in the long run both the best and most successful. "The mere politician," he says, "follows public opinion; the true statesman instructs it. His constant aim should be to make clear to those who depend upon their daily labor for their daily bread the real basis upon which their welfare rests, and then to trust to their intelligence and votes for support. Success on any other condition would be dishonor. Any party which expects to get power by playing the game of 'hide and seek' in politics does not deserve, and will not gain, the confidence of the country." All of that is as true as it can be, but whether the Democratic party will be able to realize it as such and act upon it is another matter. Mr. Hewitt speaks of his attitude as if it were the attitude of his party, which is very far from being the case now, though it may prove to be before the next National Convention meets.

At a recent date we called the attention of the Democratic leaders to the extreme desirability of their taking some definite position on the tariff in order that the country might know where they stood. Mr. Hewitt's letter is in direct accord with our remarks at that time, and cannot fail to have an effect upon other leaders who believe as he does, but who lack his courage and far-sightedness.

THE NEW STANDARD OF EMIGRATION.

THE determination of the Connellsville coke miners in Pennsylvania that the Hungarians who have attempted to settle among them "must go," shows that the feeling in favor of raising the standard of emigration is steadily gaining ground. It first showed its strength on the Pacific slope in the anti-Chinese movement. This was the first organized attempt in the history of the country to exclude foreigners from the country on the ground of their want of a high standard of life. The Californians objected to the Chinese, to be sure, as Mongolians, but mainly because they eat cheap food, and little of it, and work, in the mean Mongolian way, for very low wages. A very little experience satisfied the Californians that these habits made it impossible for them ever to become genuine Americans, and that they must consequently go. The movement excited attention on account of its novelty. The old theory of emigration was that the United States gave a welcome to all comers, especially the industrious poor, for their own sakes, if they saw any way to better their condition here, and for ours, as we needed more population. But the objection to the Chinese is that they are too industrious and too saving, the new Pacific slope standard evidently requiring that no alien should be allowed to settle here unless we can have some assurance that he will never work harder, eat less, nor save more than the average American. The Chinese do all these things in the most abandoned way, and, therefore, the Chinese "must go."

The new theory next found expression in the protest raised last summer against the "assisted" emigrants. It was strongly urged, by those engaged in developing the new doctrine, that no man or family ought to be admitted to the privileges of American life who came here by means of "assistance"—that they ought to come, if at all, in a dignified way, and not resort to the low practice of receiving money to pay for their passage. A careful examination of several ship-loads of "assisted" emigrants at Castle Garden revealed the suspicious circumstance that they had in most cases a small sum of ready money, and a railroad ticket to the West, which at once raised the question what they were going to do when they reached the West. According to their own account, they intended to work, but there was no satisfactory proof that they would not soon stop working, and thus blight the future of the whole Western country.

Indeed, the fact of bringing money from the other side raised a strong presumption that the emigrant was coming over here for the purpose of pauperizing America, on pretence of coming here for work; and the Secretary of the Treasury was strongly urged to send back all emigrants found with sums of money and railroad tickets in their possession as paupers in disguise. When it was discovered that the Secretary had no power to do this, it was suggested that Congress had better change the law. Those who opposed the admission of all assisted emigrants did not state exactly what class of persons they would allow to land, but the drift of their argument appeared to be that all but first-cabin passengers, or those who had no money at all, must go; so that, taking this in connection with the anti-Chinese movement, the new standard of admission seemed to involve the idea of a dislike of excessive toil, a love of dear food, and a disinclination to save, and also the habit of travelling first-class or travelling without money.

The Connellsville coke reformers have taken another step in the development of the theory. Their reasons for insisting that the Slavonians "must go" are numerous. Not only do these wretched barbarians fail to come up to the Coke standard in the same way that the Chinese fail to come up to the Pacific slope standard, and that the assisted emigrant fails to come up to our standard on the Atlantic seaboard, but their morals are not pure enough for Connellsville—their "marriage customs" being productive of much confusion as to

family relations—and their personal habits are unclean. Not to mince matters, what the Connellsville people say is, that the Hungarians do not wash thoroughly or often enough, and are consequently "filthy." This adds two new and important features to the standard. Not only must the emigrant eat expensive food and plenty of it, and work and save no more than the native laborer himself works and saves, but he must also be pure in life and clean in person.

What additions may be made to the standard hereafter no one can tell. As it stands it is a high one. As soon as it is put in a statutory form those here who do not conform to it "must go," and those abroad who do not conform to it will, we trust, to save trouble, not be permitted to land, for it is easier to keep undesirable people out than it is to expel them after they have once come. All that we should have to do would be to make the standard known through an act of Congress, and to require those now in the country who did not conform to it to go, and to exclude hereafter not only the Chinese, and all who work too hard and save too much, but the assisted, the impure, and the unclean. But the difficulty is that there are many signs of the growth of another standard, for domestic purposes, which, if applied generally, would lead to some curious results. In our own national life, every one knows that the moment a man goes to the other extreme and raises the standard too high, he is viewed with just as much suspicion as is the Asiatic or European whose standard is too low. In Connellsville, for instance, it is probably thought just as wrong for a man to wash himself too much or too frequently as it is for him to wash too little or too seldom; and even excessive purity and refinement are apt, in some parts of the country, to make the citizen a marked man. If we put the degraded and filthy Slavonian at one end of the scale, we are confronted at the other by the "daily bath and kid glove" American, the man who plays tennis in knickerbockers and a jersey, who hunts, who has a dog-cart or a coach. Everybody knows how often this class is reminded that it does not conform to the standard of American life. It is not told that it "must go," for to its credit it should be said that it is far less obstinate than the heathen Mongolian, or the filthy Slavonian, or the Italian "brigand." It does go whenever it can, and stays as long as it can, and so fond is it of going that, with a very little more pressure, it would perhaps stay away altogether.

It is obvious that the new standard, if adopted, will lead to important changes in the whole condition of American life. Great numbers of people who have come over here under the mistaken idea that the theory of emigration was a general welcome to all, will have to go. The new standard, avoiding all extremes, is apparently a sort of golden mean, which only needs now some precise definition by law. And this suggests the problem, involved or implicated with the question of who "must go," and which will no doubt shortly come up for discussion—Who is going to have permission to stay? For it will never do to discriminate unfairly in the application of a new standard. As to washing, for instance, this is particularly important. What is the golden mean in this respect? How much do the Connellsville critics of the Slavonians wash themselves? Would a bath a week with Castile soap be about right, or should such a matter be determined in every State by local option, like the question of licensing liquor saloons? The regulation and determination of the standard evidently calls for the spirit of compromise. It is apparently going to be high—though not too high.

DOMESTIC SERVICE.

THE discussion which has been carried on by correspondents of the *Evening Post* for some weeks past, on the difficulty of getting good domestics, and on the reluctance of young American women, and, in fact, of all women who can get any other kind of employment, to accept employment in the kitchen, treats a very old topic. It is now fifty years at least since American families began to complain of the difficulty of getting proper "help," owing to the unwillingness of the native-born to serve in that capacity. For the last forty years they have been complaining of the badness of the substitute furnished by the Irish immigrants. Now, it would appear that even the Irish, such as they are, are not to be had, in the country districts at least, even on the seaboard, and that attempts to import them for household work in such districts are likely to be failures. As the Irish immigration is falling off somewhat rapidly, it would indeed not be at all surprising if we should before long find magazine writers on this theme referring to the period between 1840 and 1880 as at least the silver age of the kitchen, only inferior to the golden age of native American help which preceded it, and lamenting the Irish servant-girl as a lost source of household comfort.

All discussion of social and political topics we hold to be good, even if it does not seem immediately profitable; so that we will not affirm that any of the time spent over the "servant-girl problem" has been wholly wasted. But we think it would in many cases be more fruitful if it were remembered that this problem is not peculiar to the United States, though its solution may seem more pressing here than in the Old World. The difficulty of getting good servants, and especially of getting them in the country, is felt with greater or less intensity everywhere, and for three reasons. One is, that there is everywhere a rapid drift of the laboring population into the great towns; another is, that the great increase and cheapness of the means of locomotion has made the class which lives by its hands just as restless as every other. The third is, that every class dislikes all employments and occupations which have about them any traditional mark of social inferiority. In fact, nothing strikes one more curiously in these discussions about the difficulties of domestic service than the apparent unconsciousness of the writers that the traits and tendencies in the laboring class to which these difficulties are ascribed, are fully as marked in the employers. For instance, the reluctance of Irish household servants to live in the country, which has made anything like isolated country life so difficult for housekeepers in the United States, is indisputably just as marked a characteristic of nearly all classes of native Americans. It makes every young man and woman starting in the world eager to get to New York or Boston. It has left scores, if not hundreds, of beautiful country houses on the Hudson River desolate, because the owners prefer Newport, or Bar Harbor, or some other place where there is more going on, in summer, and the city in winter. Moreover, the restlessness which makes servant girls frequently quit even good places, apparently without any adequate motive, is simply, in a cruder form, that which every year sends their masters and mistresses to Europe or elsewhere, if they can afford it, and sends them to theatres and concerts in the evening, to amuse themselves, instead of staying at home and reading good books.

We think, too, that the disinclination of young women to take service in families when they can get work in stores or factories, would not seem so puzzling as it does, if the writers who wonder over it asked themselves why *they* would dislike household service. Self-interrogation is often, in social investigations, a solvent of remarkable power. There is no class in our time that does not feel the passion for equality, which seems in this democratic age to be almost the greatest of the social forces. It affects all circles as well as kitchen circles. Everybody either resents an assumption of social superiority on the part of his fellows, or avoids as far as he can all situations in which he is likely to be exposed to it; and, consequently, the occupations in which there is least contact with it are those most eagerly sought after. Kitchen employment is not only that in which a woman is most frequently reminded of her social inferiority, but that in which the traditions of the earlier period, when all laboring for hire was an admission of insignificance and incapacity, is still the strongest. Nearly every other occupation has passed out of this status into the contract stage—that is, is filled by persons who sell their labor as they would sell potatoes, and owe nothing more to the purchaser. Domestic servants, on the other hand, are still expected, besides rendering faithful work, to make daily and hourly acknowledgment of their social inferiority both in their speech and in their behavior. They have, too, no refuge from this necessity except their beds, and even there they are exposed to the word of command, and are expected to answer with deference, whether they feel it or not. They are the only class of the community, in short, from which politeness is, under all circumstances, expected, and which is occasionally punished for the want of it.

In what manner household work is to be satisfactorily done, is apparently still one of the secrets of the democratic age. Consequently, we do not profess to be able to produce any immediate remedy for the undoubted evils of the present situation. We think we see that there is not likely to be much good got out of preaching to the mill girls and the "sales-ladies," that they

would do better to take places in families, as long as the preachers are not themselves ready to set the example, and in fact feel, themselves, about hired kitchen work, exactly as the mill girls and sales-ladies feel. These latter, like all the rest of us, are the creatures of their time. The breezes both of the moral and intellectual air are, in our day, felt more or less in the basement as well as in the parlor. It will probably be a long while before the relations of the householder and his domestics are adjusted on the new basis. That there will always be a class devoted to household work is just as certain as that there will always be division of labor. But there will be a change in the way in which the mistress and maid think about each other and speak to each other, though it will probably take a long stretch of what some people call a "transition period" to bring this change to a final and satisfactory conclusion. Probably the most suggestive question anybody can ask to-day with reference to this topic is, why the manners of workingmen and women are not as good as those of anybody else. Why are they not as polite and considerate in social intercourse as their employers? Why are they not as clean and neat in their persons, out of working hours? In short, why have not working men and women as good manners and, out of working hours, as agreeable an exterior as clerks, or ministers, or lawyers, or governesses, or authoresses, or musicians? The answer to this question would probably throw more light on the kitchen question than any other. The next great social revolution will undoubtedly be the disappearance of the ancient connection between manual labor and boorishness and coarseness. There is no formidable reason, after all, why the man or woman who works with the hands should not be externally as polite, have as pleasant a voice, speak as good English, make as good a bow, and be as considerate and careful about other people's convenience, and comforts, and feelings, as those who work with their brains, or live on their investments. It is a matter of youthful training simply, working on the self-respect of which every civilized human being has at least the germ.

EVANGELINUS APOSTOLIDES SOPHOCLES.

HARVARD COLLEGE has lost one of her most remarkable men. Probably no one connected with her academic society has left so vivid a personal impression on the graduates of the past forty years as the venerable Greek who has just passed away. Such a character as Professor Sophocles seldom finds his way even into the academic circles of our Western world. He was as rare a phenomenon among us as a monk of the middle ages, or even an ancient Greek, would have been. His peculiar dress; his slow, deliberate walk; his solemn, oracular utterance; the peculiar mixture of childish simplicity and biting sarcasm in his casual remarks; and his half-genuine, half-affected cynicism, were all familiar to the many classes who passed under his instruction while he was tutor in Greek to the Freshmen. Even in later years, when only a few special students enjoyed his teaching, every member of the College knew him well, and often looked with curiosity and wonder upon him as he walked to and from his room in the west entry of Holworthy. This room had been his abode since 1847, and it had generally served him for a kitchen as well as sleeping-room and study. Here he prepared his frugal meals, except when he gave his friends the rare privilege of his company; and when his dinner was ready he pushed aside the tomes of the Christian Fathers from his little table to make room for his plate. Nothing could induce him to change his hermit's cell for a more social mode of existence, and he would have been positively unhappy if he had been compelled to conform to the common rules of domestic life. He did not choose this solitary and inexpensive life from motives of economy, for he died a comparatively rich man; nor from any spirit of meanness, for he was one of the most benevolent men in the community, giving away quietly and unostentatiously every year more than would have sufficed to maintain him in elegance and luxury. He probably retained to the last some of the monkish spirit which he brought in his youth from the monastery of Mt. Sinai, in which he spent several years before he came to this country, and much of his peculiarity of manner must have come from the same source.

If one were to write a biography of Sophocles which should be in perfect keeping with his character and his wishes, he would disclose absolutely nothing of his history. His feelings on this point were strong and strongly expressed. When he was asked to correct the life of himself which now appears in Allibone's 'Dictionary of Authors,' he replied: "I shall tell them nothing; and if they publish anything, I shall always say it is a lie." We may perhaps venture to say that he was born in the village of Tsangarada, in Thessaly, on the slope of Mt. Pelion, in the early part of this century; that he spent several years in the Sinaitic monastery, partly on the Holy Mountain itself and partly in the branch at Cairo; that the death of an uncle, who was a high official in the monastery, caused him to emigrate to the United States, and prevented him from remaining as one of the brethren of Mount Sinai; that he entered as a Freshman at Amherst College in 1829, but remained only part of a year there; that he afterwards lived at Hartford and at New Haven, and came to Cambridge as tutor in Greek in 1842, remaining there until 1845, and, after an absence of two years, returned in 1847, since which year he had been identified with Harvard College. He remained tutor until 1859, when he was made Assistant Professor of Greek; and in 1860 he became University Professor of Ancient, Modern, and Byzantine Greek. His most important published works are his Greek Grammar, which appeared in two editions, and was very widely used; a Romaic or Modern Greek Grammar; a Catalogue of Anomalous Greek Verbs; a History of the Greek Alphabet and Pronunciation; and a Greek Lexicon of the Roman and Byzantine Periods, which was a larger edition of his Glossary of the Later and Byzantine Greek, published by the American Academy of Arts and Sciences.

Professor Sophocles was a scholar of extraordinary attainments. His knowledge of the whole length and breadth of the Greek literature, from Homer to the present day, could hardly be surpassed, and he had much rare and profound erudition on points on which most Western scholars are ignorant. But he was, on the other hand, little acquainted with modern German scholarship; and the works of the great masters of classic philology in Germany, except so far as they were written in Latin or translated into English, were almost unknown to him, as he never learned German so as to read it with any facility. But much which others learned with toil seemed to come to him by intuition, and many things in his books which might appear to be borrowed from others are really original with him. He was as eccentric in his teaching as in everything else that he did. He had much of the Socratic way of asking questions to show a pupil his ignorance, and then leaving him to help himself as best he could. He often asked a question, especially if a visitor was in his class-room, merely to open the way for a joke or a sarcasm. He once passed a question about a peculiar Greek accent entirely round a class, eliciting various crude guesses, and then dryly remarked: "It is a misprint." Many will remember his question as to what was done with the Persians who were killed at Thermopylæ. This called out various answers, to which he replied by a shake of his head; but when one hopeless Freshman replied that he did not know, he answered: "That is right; nobody knows." These anecdotes, with a thousand others, both historial and mythical, are very characteristic of his style of teaching, which did not always follow strictly scientific methods.

He had a great hatred of impostors of every kind, and it was not very safe for any such to approach him. A man recently called on him with some manuscripts, professing to be autographs of some of the early Fathers of the Church. He exposed the pretensions of several without losing his composure; but when at last the original manuscript of the Athanasian Creed, in the writing of St. Athanasius, (!) was produced, he called his visitor's attention to a large club in the corner of the room, and pointed significantly towards the door, by which the terrified man made his escape with some precipitation. We may venture to mention here a piece of history for the benefit of future historians of Harvard College. In the spring of 1858 it was proposed to abolish the barbarous custom of having morning prayers at six o'clock in the spring and summer. Mr. Sophocles had already given his vote for the change, but before the result could be announced by the President, the not infrequent excitement of a small bonfire on the steps of University Hall interrupted the proceedings of the Faculty. After the bonfire he changed his vote, and the six o'clock prayers were kept another year by a majority of one. On hearing the result he intimated that early rising would keep people out of mischief at night, and he certainly felt that six o'clock prayers would be unpleasant to the makers of the bonfire. Let us hope that they were!

If any one judged by his stern and often forbidding manner that he was really harsh or unfeeling, it was an utter mistake. No man ever had a more tender heart, although he sometimes seemed anxious to conceal it. Nobody who ever saw him the centre of a group of children could doubt his kindness or his human sympathies. In his declining years, when his books were less attractive, and when it sometimes seemed as if his solitary life occasionally oppressed him, he devoted his attention to a poultry yard, in which every chicken was named (generally for his special friends) and treated with personal consideration. His grief at the loss of a favorite chicken was truly affecting, and an invalid in his yard was nursed and tended as carefully as a child. Chickens were forbidden food to him after he thus became interested in their race. Although Professor Sophocles was a man of great benevolence, he studiously avoided most of the ordinary charities, and seldom or never put his name to a subscription paper. But in his own way, and often when it was least suspected, he used the greater part of his annual income in gifts of kindness. Many are the poor who will miss his charity now that his room is vacant.

In later years he had renewed his relations

with the monks of Mt. Sinai, and as his strength failed, his mind wandered more and more to the home of his youth. In February last he received a letter from the delegation of the Sinaitic brethren resident at Cairo, which cheered and comforted him in his weakness and depression. They write:

"We returned only yesterday from Mt. Sinai. We ascended to the monastery, where, with our Archbishop and all our brethren there resident, we celebrated solemnly and with all the forms and ceremonies of the Church the annual festival of our holy Saint, and offered fervent prayers and supplications to the God who descended upon Sinai that he might, through the intercession of our patron Saint, graciously grant to us your complete restoration to health, and we directed that your honored name should be expressly mentioned each day in the religious services."

The same brethren in Cairo sent him their congratulations by telegraph on his last Saint's-day. It will be a long time, we fear, before such messages will be again sent to Harvard College.

AMONG THE "MATERIALIZERS."

BOSTON, December 26.

SPIRITUALISM has taken something of a new departure lately, and it is noticeable enough to be worth describing. The process called materialization, by which what appears to be a form from spirit land manifests itself to believers still in the flesh, has been known for many years, but during the last year or so it has been improved and extended so as to assume quite a novel character. This new form which the séance has taken is said to be confined as yet to the great seaport cities, Boston, New York, and Philadelphia; but it is so successful there that it is pretty certain to spread.

At the present time there are in this city at least five mediums who are giving these séances four or five times a week each; so that if we compare the frequency of their meetings with those of most of the other sects, the spiritualists seem among the most active. The audience is necessarily small, but even the less successful ones are crowded, and seats have to be engaged long in advance; and the money taken in would support half a score of country ministers. The sitters are limited to a couple of dozen or so, in order that each may have a good position and receive a special revelation, for much of the popularity of these meetings is due to the interest that each one takes in an entertainment in which he has a personal share. The entrance fee once paid, a special spirit is pretty sure to be provided for the sitter, and generally one of an extremely affectionate, not to say demonstrative, disposition. He may not recognize the supernatural visitant, but at least he can feel its embraces, and every effort is made to make him have a good time and come again.

Most of the sitters seem to be Americans of the middle class. I have met a number of Germans, but very few Irish. Once or twice I encountered a party of well-dressed people, the youthful portion of which had come apparently for a lark, and I saw one or two people who looked fast; but generally the circle was made up mostly of simple elderly folk—retired sea captains, speculatively inclined mechanics, and the like. An introduction to one's companions did not seem to be required as a preliminary to conversation with either sex. Probably the close physical contact of the several members of the circle—who are usually arranged with alternate men and women—the music, the dim light, and occasional excitement all inspired ease; but I may mention that in the more expensive ones it was not considered good form for the men to sit in their shirt-sleeves. The general tone was one of earnest credulity, with a deceptive flavor of judicial inquiry, and some occasional light-hearted chaff. The precautions taken against fraud were extremely slight, indeed only nominal. The sitters were evidently convinced that, as Whittier says:

> "The sphere of the supernal powers
> Impinges on this world of ours,"

and no one wanted to disturb his own portion of the contact by any rude cavilling.

Thus the new revelation was accepted on very easy terms. One man was strongly affected by being addressed by a spirit by his first name (Calvin), although his next neighbor had called him by it audibly enough only a few minutes before. Another man spoke of the curious freaks of some musical spirits at a previous séance (*see-ance*, by the way, seemed to be the popular pronunciation), where certain instruments, fastened up outside the cabinet, were played upon while the medium was supposed to be within the curtains, and some fresh paint with which the instrument had been daubed was found on the medium's fingers afterwards. This showed, he said, the tricky character of the spirits, who thought it was a great joke to drum on the instrument and make it appear that the medium had done it. Another man spoke with easy confidence of the facility with which spirits imitated the voice, form, and carriage of the medium when they materialized (*mate-erllized* was the way in which I usually heard this word pronounced). Once an unhappy individual rose and asked if he might go into the cabinet; but this was considered as disturbing the meeting, and we had to wait with joined hands for five minutes before there came another manifestation. The occasional exposures have no effect on such an audience.

But let us go to one of the séances and see the details. It is in the part of the city given over to cheap boarding-houses. The room is an ordinary one of some twelve or fifteen feet square, with a double row of chairs round three sides of it, and on the other the usual dark cabinet. In some cases, an alcove, or a small room curtained off from the one where the circle is held, takes the place of a cabinet. After the audience has assembled, the gas is extinguished, leaving only one lamp, which is screened by a curtain, so that there is barely light to show one's features to those who are close at hand, but not enough to show anything but the form a few feet off. Against the dark cabinet curtains figures clothed in black can hardly be distinguished, but the white forms are very clear. We look around and count twenty-three persons, including one or two men who sit or stand by the cabinet, partly to act as ushers or masters of ceremonies to the spirits, and partly to guard against awkward accidents. One of them has a music box with which he fills the pauses in the singing. We are told to keep our feet on the floor and not to cross our legs; but there is seldom any pretence of holding hands in the old way; and we dispose of ourselves in as easy a posture as the hard chairs will allow, and join in the singing. "In the sweet by and by," "There are angels hovering around," and "Beulah-land" seem the favorites, but we have occasionally more commanding ones, "Nearer, my God, to Thee," or lighter ones, like "Auld lang syne." From an artistic point of view they cannot be called entirely successful, but they keep us amused in the pauses, and, for some curious psychological reason, most people feel more like singing in the dark, in a crowd, and are put at their ease by it.

We do not have to wait long. In a few instants there is a mysterious gleam of something white before the dark curtain behind which the medium has gone in her trance; the music pauses, and the more susceptible lean forward and draw long intense breaths. The white gleam becomes a veiled woman who advances into the room; and I feel my next neighbor tremble, and see the big drops of sweat start out on his forehead, and the woman on the other side leans heavily against my shoulder. The spirit beckons to some one; and a series of inquiries by the various members of the audience, "Is it me?" "Is it me?" presently shows that a young man is wanted who goes forward nearly to the curtain and is whispered to, embraced, and very audibly kissed; and the spirit then goes back behind the curtain, but reappears again for a moment to exchange some more kisses. Then a similar performance is gone through by another spirit with another sitter, a young woman this time, who is so excited that she nearly faints away, the kissing being very animated and prolonged again—then and indeed all through the evening. The next phantom seems that of a little child, a mere baby, but it does not entirely emerge from the curtains. Then appears a female form in white tulle, which seems the favorite spiritual travelling costume even in wintry weather, and this one has a phosphorescent gleam in her hair and belt like imprisoned fire-flies, which is really very pretty in the dusky light. Another very neat little performance is that of materializing flowers. The spirit takes your hand and makes a series of little pats and passes, and presently you find a flower between your fingers, which you are told is fresh from spirit land. The rose I receive must have been a good while on the way, from its faded condition; but the mysterious effect was very well arranged.

Then comes a short delay, and a figure in man's clothes emerges from the cabinet and seats himself affectionately in the lap of a young woman and kisses her warmly. And we learn that he was a friend of her father's who has regained his youth in the other life to a degree very comforting to some of the members of our party. The young woman never knew him in the flesh (recognition seems very difficult in a large proportion of the manifestations), but that counts for nothing in the happy abandon of spiritualism. Then come other forms, including a boy who dances round and balances a chair on his chin; and a very devotional nun. Presently a white-veiled woman summons one of the members of our party, whom she kisses and calls her darling, in longing whispers, somewhat to his embarassment, as he is not aware of having before had the pleasure of her acquaintance—a brunette he afterwards describes her, with a firm, warm clasp of the hand, full clinging lips, and sleepy eyes. She wears very, very little clothing except her veil, and seems not only very human, but strikingly like a young woman whom he has since seen in the flesh. Presently she retreats to the curtain and "dematerializes" directly in front of it. This is one of the cleverest feats, as the form appears to grow gracefully shorter and fainter until it becomes a mere glimmer and melts away, leaving nothing but a rapidly disappearing white puddle of muslin against the opening in the curtains; and it adds very much to the effect of the scene.

Another of our party is less fortunate. No doubt sundry mocking whispers have shown his incredulity too plainly, for when his summons comes he has to go shamefacedly back to his seat without any response. A little later another one is rapped for, and one of the shutters at the side of the cabinet quickly flies back, and in the window appears a white face which reminds him so strongly of a familiar barber's

block that it is hard for him to keep his countenance when he is asked if he recognizes it. It must be confessed that the medium gets the better of him a little later, however, when she comes out to deliver some messages from the departed; for then she explains that the spirit has assumed an appearance like that of our friend whom she addressed, in order to communicate more easily with him. This was plainly a fair hit, but she was not so successful when she suggested that it was the spirit of his father, as that gentleman is still in the flesh. She then went on to say that this would-be paternal spirit wished to be his guide in life. Some might call him his guardian, but he called himself his guide; but his guide was his guardian, and his guardian was his guide. He had come to tell him of the Beulah-land. If he would be happy he must be good, and especially he must yield to the spirit guidance; and so on at considerable length. To another of us she said that she saw a bell over his head, shutting him in as it were, and warning him with a tongue of foreboding. The effect of this was injured by a jocose inquiry from another young man if she meant a belle with an *e*; but the medium brought down the house by a simple rejoinder that she always spelt bell with an *e*. Before this I should have mentioned that the spirit of the little boy Billy made a prayer, in which his petition for daily bread was interrupted by an interlude of chaff with one of the audience, who wanted to know what he wanted of bread when he hadn't any bread-basket. But Billy held his own, and after a little repartee finished his prayer with great cheerfulness.

Altogether about a score of spirit forms appeared, so that each visitor got his money's worth. The difference in height showed that if the spirits were of human origin at least two persons must have been concerned; but they seemed to come in assorted sizes of only two dimensions. The various spirit voices and songs were not beyond the power of a single flexible voice to imitate. Looked at from any point of view, it was very cleverly done, however, and was at times quite thrilling.

There are many slight variations at the different séances. Some are solemnly dull, and some very lively. Sometimes the sitting ends with spirit messages, and sometimes not. One medium holds her séances in pitchy darkness, the spirits appearing with a phosphorescent light illuminating their white garments, which is very weird and phantasmal. Even here, though, where the supernatural effect was strongest, the audience was very light-hearted and jocular. There seems to be nothing left of the blood-curdling horror with which the old-fashioned ghost was greeted. Much fun was made by slang addressed to the shades between the hymns, and answered in a spirit of unworldliness so extremely guileless as to greatly amuse the hearers.

Underlying these minor variations, there is a great likeness in general effect, and that effect is both exciting and amusing; but it is undeniably a little profane and very vulgar. An entertainment which gives a dozen or two of such affectionate spirits for fifty cents or a dollar is not extravagantly high priced, but it must be confessed that it is not a very convincing or edifying one. It is not as bad as the private séances, which are often a mere cover for crime. It is not as silly as the physical séances, where one is slapped on the back or boosted on to the table in the dark, with a chair on one's head. It is indeed very well suited to attain its object; and the number of people who go regularly to these meetings time after time to meet some lost friend shows their success. But there is no intellectual substance to the revelation, and it is easy enough to see the traces of that free love which taints the whole literature of spiritualism and arrests its progress. Evidently the Quaker poet was far too hopeful when he wrote:

> "The power is lost to self deceive
> With shallow forms of make-believe."

H.

THE PARNELL BANQUET—JURY PACKING.

DUBLIN, December 15.

IT appears desirable that I should interrupt the consideration of the local government of Ireland to refer to some matters of perhaps less, but more immediate, importance. The event of the week has been a banquet to Mr. Parnell upon the completion of the "Parnell Tribute." The amount that fund has reached (£37,000) has been a surprise to many, and the fact that most of it has been collected in Ireland tends to remove the stigma cast upon her—that she is so ready to rely upon outside assistance for the furtherance of her desires. The success of this fund is most significant both as regarding Ireland's estimate of Mr. Parnell, in opposition to Mr. Forster's charges, and as a protest against Papal interference in politics.

The banquet was not paid for from the collection, but by a charge of twenty-five shillings per guest. I do not know to what extent such displays prevail with you. Here they seem to be a somewhat uncivilized, expensive, and wasteful way of honoring an individual and forwarding a cause. The civic banquets in London and Dublin, enjoyed by the few, are paid for by the many; and it is a hopeful sign that, now that the municipality here has fallen into the hands of the Nationalists, the wastefulness and absurdity of such entertainments are beginning to be protested against. That so much money should be here spent upon such an occasion is rather inconsistent in those who protest loudly against landlords amusing themselves while there is so much distress in the country. If the banquet did not equal the brilliant descriptions of National journalists, neither did it merit the sneers cast upon it by the London *Times*, nor the cynical congratulations of the Irish Conservative press, regarding the judgment with which the committee had selected the guest roll from among the overwhelming numbers of "cattle-boughers," "assassins," and "dynamitards," who must have applied for tickets.

However the company was composed, it was a pretty fair representation of those who in the future are likely to be the governing classes in this country, and as such the spectacle is worthy our serious consideration. There were present some twenty members of Parliament and the mayors of several towns. Upon the whole, the impression of the occasion is disappointing to those who had hoped that Irish agitation was entering upon a higher plane, where all could heartily join. There was occasionally manifested in the speeches a vagueness, a bitterness of tone, and a want of gentlemanly feeling that was discouraging. It would appear so easy to be determined and yet dignified in a good cause. Perhaps, considering the history and present condition of Ireland, we seek for more than we ought to expect. Bitterness and ungentleness are perhaps common to all effective struggles against wrong. This must be realized and allowed for; but where these sentiments are preëminent in a movement, it is impossible to secure the continued hearty co-operation of men of a certain training and turn of thought. The demonstration gave proof of no mere passing emotions; abiding force of some kind, leading somewhere, was there. But what that force really is, and whither it is tending, it is difficult to decide. Mr. Parnell, in his apparent impassiveness and haughtiness, is not at all the leader we should have looked for in Ireland. That he is able to live as he does in London, and to keep aloof, so far as we see, from passing Irish interests—even avoiding, as he did upon a late occasion, addressing his constituents—and yet that he should retain his hold upon the Irish people, is indeed striking. In the course of his speech he did not directly utter a word of thanks for the fund just presented to him. Yet I doubt whether any Irish leader was ever more generally loved and trusted. He is thoroughly believed in. In all he does he is supposed to be acting from some deep motive, perhaps unknown to all but himself, and for which not even he is to be asked to account at present. It is a strange and might be almost an unsupportable position—the reckoning might be so bitter in the end. But he seldom appeared better than he does at present. He is handsomer and has more light in his face than when he entered upon politics ten years ago.

His was the only really striking speech of the evening. It is much to be regretted that some passages appeared so unnecessarily antagonistic. Portions of this address will not soon be forgotten by those who heard them—his denunciation of the imprisonment of the Harringtons; his reference to Mr. Trevelyan, commencing with, "But what shall we say of Mr. Trevelyan, a distinguished radical, the good nephew of his great grand-uncle?" and leading up through a not too severe exposure of the conduct of the Government regarding the Northern meetings to these words: "Mr. Forster used to have a trick of overwhelming us by saying that his great ambition was to enable everybody in Ireland to do what they had a legal right to do; but Mr. Trevelyan's great ambition seemed to be to prevent anybody in Ireland from doing what they had a legal right to do."

A speech that gave rise to painful considerations was Mr. Sexton's. He claims to be one of Mr. Parnell's foremost lieutenants. He has at times, in the House of Commons and elsewhere, made speeches of considerable power and brilliancy. But certainly on this occasion he did not show any Christian wisdom or statesmanlike conception of facts. He implied that we should regard England with "holy hatred," and that the sole purpose of government here is "plunder." He gravely declared to a cheering audience that "England is no longer preëminent in manufactures or in commerce: England no longer claims to be mistress of the seas, and if England to-day pretended that she was able to take an equal place at the council board of Europe with the military nations of Europe, her claim would be flouted with scorn." Mr. Davitt's presence and remarks belied the impression that there was not a good understanding between the two great leaders, at least in essentials; while the steady utterances of Mr. Gray, M. P., editor of the *Freeman's Journal*, a paper which at first was by no means entirely favorable to the Land League, were a striking proof of the overmastering influence of Mr. Parnell in Irish affairs.

But if the considerations raised by the Parnell banquet were discouraging to some who are impelled by their convictions to take a part in Irish politics, what has been passing in the court-house at Green Street should convince them that great efforts are indeed required for a modification of the present régime. The dock there has this week been again crowded with respectable-looking frieze-coated peasants. Those who appear there at present are on trial for the commission of a barbarous murder—that of Mrs. Smythe, in the County Westmeath, in March, 1882. There is no reason to suppose that this or any other murder was instigated by the

Land League. When poor Mrs. Smythe's brains were spattered over the faces of her brother and Lady Monck, who sat in the carriage with her, the League had been suppressed, and Mr. Parnell, the leaders, and the other suspects had been in prison for many months. Still we cannot deny that the deed arose from the way in which the land question is viewed by the peasantry; and, with the shadow of this murder so clearly brought home to our consideration, it is difficult to understand how Mr. Parnell could have declared in his speech, that "even in association" with the late movement there was "such an utter absence of crime."

The trial of these men is not yet concluded; the jury wait only the judge's charge—all the evidence having been given. There is nothing in it that would lead me to convict the prisoners. But if they are not guilty, others of their class are, and with several individuals near at the time of the occurrence there are none to give evidence but men of apparently the worst character, and who expect large Government rewards, representing to them permanent fortune. The dock in which the prisoners stand is that from which in 1798 scores of the United Irishmen were sent to the gallows: it is that from which Emmet, one of the most chivalrous characters in Irish politics, delivered his famous speech before sentence and execution; it is the dock which from those days to the present has been the central one of many all over the country from which, through assizes, and jail deliveries, and special commissions, have been sent thousands to imprisonment and death (imprisonment often worse than death) for crimes which could arise only in a badly regulated country.

And then the means by which it is now sought to bring punishment home to these men, if guilty! Until within some fifteen years ago the summoning of juries in Ireland, for both civil and criminal cases, was practically in the hands of the crown officials, and was carried out in a grossly unfair manner. The few citizens were victimized, the many escaped scot free from service. In civil special juries, where twenty-one shillings per juror, per case, is allowed when a decision is arrived at, a class of "guinea pigs" grew up who almost made a living by the business, who were believed to bribe the Sheriff's officers to summons them, and who were careful to commend themselves to the court and the bar by not giving much trouble in arriving at decisions. In criminal cases, culprits had little chance of ever being tried by their peers. This was all changed by Lord O'Hagan's Act, and for many years everything went admirably. Jury service was spread over the whole tax paying community, every one was called to service only in rotation, and there was no possibility of juries being unfairly selected. But the land agitation arose, and it was often found impossible to secure the conviction of the most undoubted criminals, where the crime could be in any way connected with the occupation of land or with politics; and of course from that the gradation was easy and natural to a lenient view of all crime. One of the chief provisions of the last Coercion Act was therefore to permit change of venue, and a reversal in criminal cases, where so desired by the crown, to the old plan of selecting juries. In that a larger number of jurors are summoned upon a definite basis, it is fairer than the state of things that existed before O'Hagan's Act; but in that this larger number belong in the main to a caste imbued generally with inimical feelings towards the class from which Irish agrarian offenders are drawn, and in that the prisoner can challenge peremptorily without cause only twenty in capital and six in other cases, while the crown has unlimited right of challenge, the present system amounts to selection by the crown and cannot work fairly. And still, only for some temporary change, society would hardly have held together. The strenuous opposition of Nationalists to all such interferences with the ordinary law is of course based on the conviction that, if certain radical changes were made in the government of the country, such drastic and disturbing measures would be no more necessary in Ireland than elsewhere. Under the present system I feel little doubt but that some innocent men have been sent to the scaffold and several into penal servitude. Except for appearances, trial before a bench of judges without a jury would be fairer. Certainly an innocent man would prefer to be so tried. It is most painful to see men going into the jury-box to try those against whom they are hopelessly prejudiced.

An analysis of the connections and probable proclivities of jurors summoned up to a certain period was some time ago privately circulated over Ireland. It was suppressed by the police, and very properly, for it was issued with the evident intention not of condemning the system so much as of subjecting to opprobrium and perhaps violence the jurors who had served under it. Reference to other statistics, however, exemplifies how the system has been worked. The population of the County of Dublin is composed of 10 Protestants to 32 Catholic. The prisoners to be tried were all Catholics. Upon some important cases some months ago two panels were summoned from which to select jurors for the trial of a number of capital cases. The panels were found to consist of sixty-three Protestants and thirty-seven Catholics, and fifty-two Protestants and forty-eight Catholics, respectively. There were five juries empannelled. The first was all Protestant, the second all Protestant, the third all Protestant, the fourth all Protestant, the fifth all Protestant. It can easily be imagined what effect these proceedings have upon a Catholic country: all law is brought into contempt, and the mass of the people are inclined to sympathize with every criminal. This general demoralization is the worse result.

And then justice is not only liable to be perverted, but it is delayed under the present procedure. One of the main points of Magna Charta was that justice should neither be denied nor delayed. The men now being tried are in custody since May. Many of those tried and convicted on the clearest evidence within the past years would have escaped free if they had not been detained in prison until evidence was forthcoming upon which a jury was likely to convict. So it was with Poole, now under sentence of death. He has been, if I mistake not, more than a year in custody. But, on the other hand, some men have been kept in prison for months, and in some cases over a year, by adjournment after adjournment, at the desire of the crown, and have then been shown to be entirely innocent of the charges brought against them. In a recent murder case the crown itself, after its first witness had been examined, entered a *nolle prosequi*, the prisoner having been detained ten months awaiting trial. Moreover, it is reasonable to suppose that these large rewards for conviction (£2,000 in Mrs. Smythe's case) should develop a class of witnesses whose untrained minds become unduly influenced by police suspicions, and possibly suggestions, and warped by the hope of immediate gain, and who are ready to stop at nothing in securing convictions. So affairs go their round. Misgovernment and procrastination of reform lead to fierce agitation. Fierce agitation inevitably develops crime; and then we have political prosecutions and punishments. As the *Pall Mall Gazette* writes regarding the banquet: "We gave them the plank bed, the solitary cell, and prison fare. They give us in return 'vulgar obloquy' and 'truculent abuse.'"

No thoughtful person who has the best interests of Ireland at heart can help deploring the attitude often assumed by the leaders of the Irish people at the present moment; but, calmly considering the situation of the country and the facts of the case, we must conclude that the time has come to change the system under which we have hitherto lain, the fruitful source of misery and demoralization. D. B.

P. S.—Perhaps before this letter reaches you some correspondent will have drawn attention to a manifest blunder in my letter of November 3, where I stated that the Catholics of Leinster, Munster, and Connaught are to the Protestants as *thirty to one*. The proportion is *ten to one*.

SCHERER ON DEMOCRACY IN FRANCE.

PARIS, Dec. 7, 1883.

M. EDMOND SCHERER has been long known as a literary critic of eminence. He was for some time a minister of the Reformed Church of France, but he left the Church a long time ago, and there remains nothing in him of the minister except a certain force of argumentation, and a certain sort of "vis theologica" which is dangerous to his enemies. When his friend, Nefftzer, who was also brought up in the Protestant Church, founded the *Temps*, Scherer became, and has ever since remained, one of the principal contributors to this paper. Nefftzer's platform was what was then called the liberal union—the union of all the liberal forces against the Empire. In case the Empire should be overthrown by some accident, or by the will of the people, it was agreed between the founders of the *Temps* that it should support any government established on liberal principles, whether it was a republic or a constitutional monarchy. Scherer did not, therefore, enter politics as a theoretical republican. When the war of 1870 broke out it found him at Versailles, where he remained during the German occupation. As soon as the National Assembly was elected Scherer threw all his influence on the side of Thiers and of the Republic. His daily account of the discussions which took place at Versailles, while it was animated by the most intolerant party spirit, was full of eloquence, of passion; and it is not too much to say that his campaign against the monarchical party in the Chamber was conducted with the greatest talent.

Scherer is not an orator; since he entered the political assemblies (and he is now a Senator for life—what we call an *inamovible*), he has not once ascended the tribune. He is shy, he somewhat disdains all rhetorical effects, his voice is thin and inaudible; but as a writer he has had no equal among the Republican journalists. Nobody did more than he to bring over to the Republican cause the wavering French bourgeoisie, the enlightened classes. He has never addressed himself to the people; he understood that the Republic was to make converts in the higher classes in order that the people should have leaders. At the moment when the form of government was still undecided, and depended upon a single vote, he was incessant in his appeals to the bourgeoisie; he succeeded, the Republic was voted by a majority of one, and this vote was given by a gentleman who had always been a Royalist. The constitutional laws which form the present Constitution of France were in reality the work of a monarchical assembly; since they have been enacted, France, with its usual logic, has accepted all the consequences of the new régime.

The Government *de facto*, after a period of agitation, always becomes stronger and stronger, and the people are not slow to understand the consequences of a principle. These consequences have developed themselves with much rapidity; the republican Government, finding under its hand all the instruments of a monarchical past, has used these instruments without even attempting to change them. The prefects of the Republic wield as much power as the prefects of the monarchy, or of the Empire; they have as much patronage, they walk surrounded with as much pomp and ceremony, they meet with the same generals, the same officials, the same mayors appointed by the Administration, the same Government engineers, the same commissioners of police, the same gendarmes. They are unknown to the country, as the intendants used to be: heaven-born, they fall from the political Olympus. One comes, another goes; they are all alike, all invincible, all irresistible. The Republic, from patriotic motives, has been obliged to increase the army. M. Grévy, the President, is the nominal chief of an army of more than a million of men. There used to be a sort of provincialism left in the magistracy: the judges remained in their native province, and the courts, while they administered the same law, had local traditions—they were the heirs of the ancient *parlements*. The suspension of the irremovability of the magistrates has allowed the republican Minister of Justice to strike a great blow at these old traditions. The men of the North have been sent to the South; the men of the South have been sent to the North. The magistracy has been levelled, it must feel its dependence upon the state. Centralization has never been stronger, more complete, than it is now. The officials (and their name is legion) are spread like dust all over the country; the ministerial will can make tornadoes in these clouds of dust. But what is the ministerial will? It is the will of Parliament. And what is Parliament itself but a collection of men, chiefly unknown, creatures of universal suffrage, unconscious as universal suffrage is often, led by instincts, by fears, by jealousies, more than by reason?

It would be unjust to throw the responsibility of this situation on the Republic; it would be throwing it on a mere word. For if monarchy were reëstablished to-morrow, the situation would hardly be altered fundamentally. What we see is only the development of forces which have been at work since the principles of social hierarchy were eradicated in 1789. M. Scherer has suddenly taken alarm at the state of France; he has written a pamphlet on democracy. But it is a long time since M. de Serre wrote "La démocratie coule à pleins bords." The dangers of democracy are not new; they were known in the Greek republic, in the Italian cities. We have seen democracy at work in the United States and in Switzerland. In the United States democracy has its remedy in the federal principle. If France is ill-governed in one department, it is ill-governed in the eighty-six departments; while in America one State may be a hell and the other almost a paradise. The functions of the Central Government, important as they are, in the United States, do not affect all the relations of life. In France we feel the Central Government in the smallest village; we are never, nowhere, out of its reach. And the terrible feature of this situation is the fact that, in the long run, the Central Government, whatever the institutions may be, is always inspired by Paris—by a nervous, excitable, irritable, corrupt, irreligious city, which thinks itself sincerely the citadel of truth and of right, the centre of the thinking world, the Jerusalem of liberty. M. Scherer voted for every one of the measures which have brought about the situation which now alarms him; but, to do him justice, he cast his vote against the law which brought the Government back from Versailles to Paris. He is not a Parisian; he is a Versaillais.

M. Scherer begins with the history of universal suffrage in France. I remember very well how it was introduced. The Revolution of 1848 was made with the cry of "Electoral Reform"; but those who proclaimed in 1848 the right of universal suffrage, little knew themselves what democracy was. The Revolution of 1848 was a sedition; it had a cry, and nobody understood the applications of the new formula. Neither the chiefs of the new government nor the electors themselves showed much respect for the new right. The correspondence of Mme. Sand well shows how disappointed and angry the republicans were when the new electoral masses gave their votes to conservatives. We must, she says, "launch the election in a republican direction"; we must "sweep away whoever has the bourgeois spirit"; we must try to "have an Assembly against which we shall not be obliged to employ force." There was no real respect for the majority, no regard for the ideas opposed to the ideas of the men in power. The disappointment was intense when universal suffrage virtually abdicated into the hands of Napoleon III., and gave him a plébiscite over and over again. But universal suffrage has now prevailed in France since 1848; and in 1870, when everything was in question, no party, no statesman dared to propose any limitation to it.

M. Scherer thinks that this respect for universal suffrage has its dangers. "Universal suffrage, if we believe a certain school, is not a political institution, it is the foundation of all rational society; the competency of the masses is not exhausted by the choice of representatives, it embraces everything." This school has made so much progress that we have placed no limitation on, no obstacle to, the right to revise the Constitution. One of its principal articles, the choice of the political capital, has already been revised; a majority of one can dispose of every article of the Constitution, as well as of any article of the most ordinary law. Universal suffrage will suffer no contradiction, no temporizing; it will take no precautions against its own caprices or passions. There is, in fact, no respect for the Constitution; it is not regarded as a covenant, an agreement tying two generations together. The nation, as a whole, is looked upon as independent of any written document, any treaty, any abstract definitions. "Universal suffrage is the depository of a superior wisdom. It is invoked as the organ of reason and the arbiter of justice. These new Egyptians have found their Apis; these Anamites have found their white elephant."

A new phrase is beginning to be substituted even for the phrase universal suffrage. We hear much about the "nouvelles couches" (the new strata), the "couches profondes" (the deep strata). Gambetta first used the word, as if political wisdom was not on the surface—in the educated classes—but in what in England would be called the *residuum*. M. Scherer is very hard on these profound strata: "What intemperance of logic, or, if you prefer, what power of abstraction is not necessary to consider capable of governing, or even of taking care of their material interests, these populations of France, which we know to be in their lower parts so backward, so ignorant, so egoistical, often so corrupt—devoid of any public spirit, alien to all general and generous ideas, knowing only labor and the salary of labor, or idleness, intrigue, and agitation?"

The conclusion of these reflections is not cheerful; for on one side M. Scherer proves that democracy tends to be more and more the arbiter of the country, and on the other side he shows it to be incapable of governing, of rational and profound ideas. He describes the political life suited to democracy, or created by it, in very dark colors. He draws a good portrait of the professional politician: "Politicians belong to the liberal or semi-liberal professions. They have some education, some facility of speech, social habits, a taste for politics, and naturally for advanced politics. The same ardor which induces them to play a part induces them to enter the Opposition. Against whom shall their turbulent instincts turn, if not against authority?" The electoral committees are composed of such men; their programmes are rhetorical and vague; they determine the elections; the candidates become their creatures. Once elected, the deputy or the senator becomes the slave of these committees. They keep a sword of Damocles over his head. All his votes are dictated by them. "Such is," says M. Scherer, "the situation to which France has been brought—the local committee naming and governing the deputy, the deputy giving his vote to the Government only upon satisfaction of his personal ends, the electoral interests understood in the most narrow and material sense. . . . A great evil and a great shame!" The consequences of such a state of things are already visible, and I will soon follow M. Scherer in his analysis of their development.

Correspondence.

THE MORMON PROBLEM.

To the Editor of The Nation:

Sir: As a reader, though not a subscriber, will you permit me to make a suggestion as to the remedy for the Mormon question, now discussed in your valuable columns?

The law as it now stands is sufficient, I take it, to suppress Mormonism, *if enforced*. The difficulty is in the enforcement (as it would be with any other law), by reason of the sympathy and bias of juries. Is not this so? If it is, is not a simple remedy to provide for "informations" by the district attorney instead of "indictments" by grand juries; and that if the district attorney shall state that the Government cannot get a fair trial, by reason of local prejudice, etc., the judge shall remove the cause for trial to the U. S. District or Circuit Court of an adjoining State or Territory? This would insure fair trial and an enforcement of the law.

Yours truly, Walter Clark.

Raleigh, N. C., December 26, 1883.

[The trial, under the Constitution, would have to take place in the State and district ("which district shall have been previously ascertained by law") in which the crime shall have been committed.—Ed. Nation.]

To the Editor of The Nation:

Sir: Two years ago, in correspondence with Mr. Willits of Michigan, then a leading member of the Judiciary Committee of the United States House of Representatives, I anticipated your remedy of solving the Mormon problem—by stopping the influx of Mormon recruits from abroad—by some such bill as that which was enacted soon afterwards as to pauper immigrants. Mr. Willits answered me, that he had no doubt my proposed remedy would work a cure; but he thought a bill to that effect could not be passed. Perhaps it might be looked upon now

with a more favorable eye, seeing the utter failure of the Edmunds bill.

But another measure ought to be united with all attempts at forcible repression. There is another problem that is now troubling the people of the United States: it is the surplus—what to do with one hundred or one hundred and twenty millions of dollars a year, needed neither for Government expenses nor for interest on a national debt, of which the principal is not due? Wharton Barker and, in a measure, James G. Blaine want to distribute this surplus among the States. President Arthur would put it into ironclads; Randall and Dana get rid of it by means of free whiskey and tobacco. I suggest, Could the surplus revenue for three months be put to any better use than buying out the Mormons? The details of the buying-out business cannot well be discussed in detail, but if Congress can find a commission of three men of sufficient honesty to be intrusted with the handling of twenty-five millions of dollars, polygamy within the borders of the United States can be gotten rid of within twelve months from the passage of the act appropriating the money. The alternative is some sort of a war, and that will cost a great deal more.

This suggestion is by no means intended for sport. The writer makes it in the best of good faith.—Respectfully, L. N. D.

LOUISVILLE, KY., Dec. 27, 1883.

COMMITTEES.

TO THE EDITOR OF THE NATION:

SIR: The United States might be most correctly described as under a government of committees. Whether this was the purpose of the framers of the Constitution may be doubted, but of the fact there can be no question. On looking over the creations of that autocrat, the Speaker, I find that there are forty-three standing, four select, and one joint committees, the smallest having four and the largest sixteen members. The whole number on the standing committees is 477, giving an average of 11. Every member of Congress is therefore on one, and some on two or three committees, so that the body itself disappears, or, in other words, "we can't see the forest on account of the trees." The struggle for position on these committees seems to be severe—one does not exactly see why; and from the high dudgeon manifested by Messrs. Cox and Springer, one can fancy that, after all, the Speaker does not have a very lovely time of it. Members with proper self-respect, however, should feel that a man's place is what he makes it, and that the smallest fraction of the smallest committee, if he is only thick-skinned and persistent enough, can make himself disagreeable, and can block the business of the country almost as much as the chairman of the most important.

How many people in the country seriously reflect that here are forty-three distinct bodies, every one with exactly as much right to the time of the House and of the country as any other, the proportion which it really gets being dependent on its skill in intrigue, or on the voluntary concessions of the others; that the whole forty-three work at cross purposes, with no reference to each other, and no necessary connection with anything that has ever been done before; and what golden opportunities such a state of things offers to a professional lobby.

If only we could for a little while stop talking about the product and look a little at the machinery! If we could divert a little attention from the *ends* of tariff, coinage, and civil-service reform to the *means* of getting at them by organization, leadership, and decent common sense in the methods of doing business; could set ourselves to compel Congress to remember that in every regiment there must be some privates, and that all cannot be captains! G. B.

BOSTON, Dec. 28, 1883.

"THE LOBBY AND ITS CURE."

TO THE EDITOR OF THE NATION:

SIR: There may be reason in the unreasonable usages and institutions of mankind "G. B.," in the *Nation* (No. 964), shows some vexation because the lobby is not done away with by giving the Cabinet seats in Congress. In the *Contemporary Review* for December, Émile de Laveleye had an article on "The Prospects of the Republic in France." It was graphic and suggestive as to the weakness of mixed representative and Cabinet administration. His inference from that weakness is that "the nations of the present day must learn to live and to develop outside and independently of their governments." Illustrating what he means, he says ministerial changes and Cabinet crises are so frequent in Holland as often to make an end to government, but the advance of economic progress is not stopped; and that in Switzerland local authority, and even the Federal Government, is losing its power and playing a less important part in the life of the nation. Now, surely, in the United States our institutions and popular opinions about government are sufficiently democratic; nor is there need to make a goitre of and on our representative system in order to teach our people to rely upon themselves and not upon the Government. To give the Cabinet seats in Congress will tend to make it so that the Executive Department of our Government must change whenever there is a change in the political complexion of Congress. When a completely representative character is given to the Executive by seating it in Congress, then the one must become as unstable as the other, and both must be representative in the same way. And another result will be that when the difference between the Legislative and Executive Departments is thus broken down, it will increase the disposition of the people to look more and more to the Government to do things the people should do wholly outside of Government.

In any event, to read in the same hour "G. B.'s" note in the *Nation* and Laveleye's article in the *Contemporary* makes a keen feeling that we had better not risk too much to new devices, even to cure the lobby grievance. S. M. C.

KEOKUK, IOWA.

ERRORS OF THE REVISED CENSUS.

TO THE EDITOR OF THE NATION:

SIR: In the issues of the *Nation* for August 24 and 31, and September 7, 14, and 21, 1882, there appeared a series of letters calling attention to a number of more or less serious errors in the first part of the Population volume of the Tenth Census. A new edition of the volume then criticised has recently been published. Many mistakes pointed out in the *Nation* have been corrected. Others quite as gross and quite as clearly demonstrated are reproduced. Any one who will read the discussion in the *Nation* of August 24, 1882, of the errors in table I *d*, on page 5, will see that the blunders as to the number of inhabitants to the square mile in the District of Columbia were more serious and gave greater evidence of ignorance or carelessness than the error as to Connecticut. In the new edition the latter mistake is set right, while the figures for the District remain as they were. It will be remembered that General Walker said, in the *Nation* of October 19, that a ten-year-old boy in three minutes could correct the blunder of 10,000,000 in the hypsometric tables on page lii. It is to be regretted that the boy has not yet received an appointment in the Census Office, for the table is still 10,000,000 out of the way. There does not seem to be any indisposition to make changes. Thus, although General Walker stated that the criticism made in the *Nation* of August 24 upon the inconsistency between the charts and the tables as to the mean annual temperature of West Virginia was not justified, it will be found that in the lately issued edition the chart has been altered in accordance with that very criticism.

I have not space to go on with the enumeration of mistakes that should have been corrected and were not. It is only necessary to say that there are quite a number of them. They are, after all, by no means as interesting subjects of comment as are some of the attempts that have been made to straighten out admitted inaccuracies. One of the most curious blunders in the first issue was that by which, in the mean annual temperature tables, the figures for Missouri were all moved one column out of their places. They have now been put in their proper positions. But, as was pointed out in the *Nation*, the totals for the columns had been made up on the supposition that the figures for Missouri belonged just where they were printed. It therefore became necessary to change these totals in the second edition. The table on page 16 purports to give the population in 1870 of each of the mean annual temperature belts shown on the chart. The totals for the belts from 45° to 50° and from 50° to 55° are now given correctly, but the total for the belt having a mean annual temperature of from 55° to 60° remains just as it was in the old edition, while 5,754,297, which would be the correct total of that belt, is given as the total for the belt from 60° to 65°, and the total for this last-mentioned belt is moved over and stated to be that of the next higher belt, viz.: 65° to 70°: the effort to correct an old mistake thus results in making wrong something that was before right. As this is perhaps the grossest exhibition of carelessness that appears even in this volume, it will be worth while to contrast below the old figures, the correct figures, and the new figures:

Belts.	Old figures.	Correct figures.	New figures.
45°-50°	12,202,544	11,159,808	11,159,808
50°-55°	12,347,374	12,719,592	12,719,592
55°-60°	5,091,820	5,754,297	5,091,820
60°-65°	3,577,710	3,585,751	5,754,297
65°-70°	2,351,793	2,351,793	3,585,751

If any one had run an eye up the columns, the mistake would have been apparent.

In the *Nation* of August 31, 1882, it was shown that although Table 10, on page 27, did not place any part of Maryland in population group 5, in point of fact some six hundred square miles of its territory should properly be included within that group. In the new edition the correction is made, but the totals for the country are left unaltered, and consequently do not correspond with the detailed statements printed below them.

It is not worth while to take up your space with any more discussion of this matter. The examples that have been given prove conclusively that important parts of the work of compiling and publishing the Census have been committed to persons whose ignorance or whose carelessness is so great as to render untrustworthy anything with which they are concerned. I do not know what is the internal organization of the Census Office. It is sincerely to be hoped that a different set of clerks

have handled the other classes of statistics, and that the labors of those engaged upon the generalizations of the Population volume have been rigidly confined thereto. JOHN C. ROSE.

BALTIMORE, December 22, 1883.

DEVONIAN SCENERY IN THE "CENTURY."

TO THE EDITOR OF THE NATION:

SIR: The well-known signature of Francis George Heath is enough to compel attention to the opening paper of the *Century Magazine* for December. The author of the 'Fern Paradise' may well speak with authority of all things Devonian, for truly he knows the "fairest county of England" by heart. This makes it the more to be regretted that his article, instinct as it is throughout with feeling for the true character of the scenes he describes, should be illustrated by drawings so utterly inadequate to convey any true notion of their appearance. Take, for instance, that called "Clovelly from the Pier." Instead of the quaint and single village street, unique of its kind yet thoroughly English, here is a view the Spanish character of which is the most striking peculiarity. Then turn to the drawing bearing the title of "On the Dart at Dittisham," which, whether it be from nature or not (and the unnatural resemblance between the two trees in the middle distance is suggestive of a sketch from memory only), is certainly by no means calculated to give a true idea of the wild, romantic stream on its way from its birthplace on Dartmoor to the sea.

It is, indeed, matter for regret that those Americans who are unfortunate enough never to have visited the moors and glens of Devon should be put off with such misleading sketches as these, which are really worse than none, contradicting as they do the spirit of the text.

In the November number of the *Century Magazine*, in a paper on "Nature in England," is a series of drawings of a very different character, in which the grassy uplands, the low-lying meadows, the sheltered village homes, and many another distinctively English scene, are rendered with a skill showing long and familiar acquaintance with English country life. Alas that the fairest county of all should have been afterwards singled out for misrepresentation!

N. D'ANVERS,

Author of the 'Elementary History of Art,' etc.

HAMPSTEAD, LONDON, December 14, 1883.

Notes.

HARPER & BROS. have just published 'The Bread-winners,' which has been copyrighted both in England and in the United States, and is thus thought to be secure against Canadian piracy.

R. Worthington will issue immediately, by arrangement with the English publishers, the story of "Chinese Gordon," by A. Egmont Hake, author of 'Paris Originals,' etc., with portrait and maps.

Early this month Lockwood & Co. will publish 'Off-hand Portraits,' by Stephen Fiske.

Among the calendars of the new year we remark, for certain felicities in the colored and illuminated design, the Whittier Calendar (Houghton, Mifflin & Co.); and for its odd heart-shape, the Leap Year ("Cupid is King") Calendar, also a Boston production, with appropriate selections by Kate Sanborn.

The 'Connecticut Almanac' for 1884, edited by Prof. A. W. Phillips, of Yale College, and published at New Haven by Henry H. Peck, is, we take it, a new enterprise. It opens with a clear description of the "standard time" which now regulates the clocks and watches of the various divisions of this continent, illustrating the subject with a diagram—one of several which show also the rainfall and temperature of the State, etc. For its special public this almanac will be found very useful.

The 'Florida Annual' (New York: C. K. Monroe) has a friendly introduction from Mrs. Stowe, who vouches for the editor's qualification to answer by this method the innumerable questions about Florida with which both have been plied. It consists of a variety of contributed articles, mostly having a serious purpose to instruct, and of statistical tables which leave little to be desired. There is a chapter for sportsmen as well as for invalids, and a paper on "Adventures with Alligators." A new large-scale sectional map accompanies the present issue.

To the various secular and religious monthlies is now added the *Andover Review*, of which the first number is before us (Boston: Houghton, Mifflin & Co.). Its theological as well as ethical and practical purpose is declared to be expressed in the exhortation, "Let us learn to live according to Christianity." The editorial control of the *Review* will be in the hands of Professors Egbert C. Smyth, William J. Tucker, J. W. Churchill, George Harris, and Edward Y. Hincks, of the Theological Seminary. Progressive Orthodoxy is their denomination, and permits a warm welcome to Matthew Arnold in the present number. Besides contributed articles and editorials, there are archæological notes and book notices. The *Review* is beautifully printed.

Historians whose theme is the United States must, it seems, be prepared for pamphlets such as Bancroft's volumes have elicited. A controversy begun in the columns of the *Nation* as to the accuracy of Mr. McMaster's statements regarding colonial education in South Carolina, resulted in a paper read by Mr. Edward McCrady, jr., before the Historical Society of that State in August last, and this in a pamphlet entitled 'Education in South Carolina prior to and during the Revolution.' The historian seems to be convicted of some unguarded statements, but his critic can also be careless, since he falls into the error of naming 1607 as the date of the founding of Massachusetts, and reckoning from it (p. 21). The pamphlet is worth reading. An appendix, by way of vindicating the culture of South Carolina gentlemen, many of whom, like the Rutledges, Laurenses, and Pinckneys, were educated abroad, gives a list of family portraits by Reynolds, Copley, Gainsborough, West, Ramsay, Romney, and Gilbert Stuart.

Pach Bros., No. 841 Broadway, send us a well-lighted photograph of the three chiefs of the Corean Embassy, taken on board the United States steamer *Trenton*, just prior to their departure for Europe. The likenesses are excellent, and the accessories picturesque; indeed, the background of these quaint foreign figures is eminently typical of Western civilization.

The peculiar Continental form of charity which consists in getting out an illustrated paper for the benefit of the victims of floods, fires, earthquakes, etc., has been exemplified afresh in *La Hollande-Krakatau* (Paris: K. Nilsson; New York: F. W. Christern), apropos of the extraordinary catastrophe in the Straits of Sunda. The pictures are of all sorts—mostly Dutch—only one depicting the effects of the earthquake in question, and the rest entirely cheerful, as is not apt to be the case in French publications of this order. Autographs in facsimile abound, and there is an autographic page of musical compositions for the occasion.

It may be well to warn American readers interested in the story of the French stage against two books which have recently appeared in Paris, and which purport to be, one the 'Mémoires d'un Chef de claque,' and the other 'Souvenirs d'un Homme de théâtre.' The memoirs of a chief of claque might be very interesting, but they are not to be found in this book, which is a compilation from familiar sources, and the most of the few good anecdotes it contains suffer sadly in the telling. The other book pretends to be the recollections of Charles Séchan, the chief scene-painter of the Romanticist revival, but it is manufactured on the same principle, although with far more skill. Almost the only fact of even slight interest to be disinterred from either book is the discovery that Jouy, the author of the "Sylla," in which Talma "made up" for Napoleon, and of the libretto of "William Tell," served in America during the Revolution.

Just before and just after the fall of the Third Empire M. Louis Ulbach, then the editor of the *Cloche*, began the publication of a series of pen-portraits of living celebrities, starting off boldly with a vigorous outline of the character of Louis Napoleon. Ten of these portraits he has now reprinted in one volume, 'Nos Contemporains' (Paris: Calmann-Lévy; New York: F. W. Christern), with emendations and with abundant qualifying and explanatory notes, in some of which he gives later and most interesting details of the people portrayed. The best are the sketches of the Emperor, of George Sand, and of Sainte-Beuve. Those of Lamartine and Victor Hugo are wholly uncritical in their unrestrained eulogy. The others are devoted to the Duc d'Aumale, Louis Blanc, Mazzini, Thiers, and M. Grévy.

— On Thursday and Friday, Dec. 27 and 28, a convention of professors of modern languages was held in one of the rooms of Columbia College, and steps were taken toward the establishment of a national association to be charged exclusively with the interests of modern philology (including English) in American colleges and universities. The preliminary convention was attended by about forty persons, representing the Johns Hopkins University Harvard, Yale, Michigan, Brown, Williams, Tufts, Columbia, Princeton, Syracuse, Lafayette, Vanderbilt, and a few other institutions. President Franklin Carter occupied the chair. The object of the meeting was to enable those who are occupied with the more advanced study and teaching of modern languages in the United States to confer with each other in regard to the various interests of their special work. Four sessions were held, and the convention did much discussing and but little resolving. The more prominent questions considered were whether the degree of B.A. ought ever to be conferred on students ignorant of both German and French; whether German or French, or both, should not be made a requirement for admission to the ordinary college course, and whether oral practice, *i. e.*, "conversation," is either practicable or desirable in college teaching. Of these questions the first two were tabled after considerable discussion; in regard to the other a resolution was finally passed without dissent, to the effect that in colleges and universities the "primary aims of instruction in the modern languages should be literary culture, philological scholarship, and linguistic discipline, but that oral practice is desirable as an auxiliary." The convention refused to commit itself to any sort of polemical attitude toward the classical languages. The secretary of the committee which will make all arrangements for the next convention is Prof. A. M. Elliott, of the Johns Hopkins University, Baltimore.

—Mr. S. R. Koehler writes us, apropos of some comments of ours in our recent review of 'Original Etchings by American Artists' (*Nation*, No. 964, p. 513), that Hegel was the author of what seemed to us the incredible nonsense of saying, "that the subjective element in a work of art is simply the base peculiarity by the admixture of which its indwelling spirit is contaminated." He cites Hegel at second-hand in Theodor Mundt's 'Aesthetik' (p. 60 of the first edition, Berlin, 1845), as follows:

"Hegel's Verhältniss zur Bestimmung der Kunst charakterisirte sich ferner dadorch, dass er das Subjective im Kunstwerk nur als diejenige schlechte Besonderheit bezeichnete, durch deren Beimischung der Gehalt des inwohenden Geistes sich beflecke."

—When the plan of a new journal for the benefit of German librarians was published, Dr. Petzholdt, it will be remembered, suggested that the librarians would consult their own interest, as well as afford partial and inadequate compensation for his own life-long and ill-rewarded labor in the same field, by giving better support to his *Anzeiger*. Dr. Petzholdt more than deserves the credit which he claims for his disinterested devotion to the cause, but his point of view is antiquated, and it was much to be desired that there should be a German journal abreast of the time. We regret to say, however, that the subscriber to the *Anzeiger* who throws over that valuable (however improvable) journal for the new *Centralblatt für Bibliothekwesen*, the first number of which (January, 1884) lies before us, will lose more than he gains. It is very neatly printed, and the sheets are actually stitched, instead of being merely stuck together (in the usual slipshod fashion of German books, the *Rundschau* not excepted) with a bit of glue. But as to contents, it is behind the *Anzeiger* both in interest and in usefulness. It has the same style of antiquarian articles—which belong to the history of literature, or of the art of printing, or anything rather than *Bibliothekwesen*—as has also the *Anzeiger*, but it has not, except in very small measure, the bibliographical notes which constitute the useful feature of the latter. So far as he goes, however, the editor shows himself the friend of progress. He deprecates the practice (almost as common here as in Germany) of making the librarianship in universities the *avocation* of professors who can put into it neither their heart nor the best of their time. He advocates the consolidation, as at Strassburg, of Government and University libraries where such exist in the same town; and we infer from a guarded statement that he would not disapprove a policy which should make German libraries useful after the fashion of American, British, and French libraries. A contributor proposes also a coöperative index to periodicals which, he thinks, "might appear *soon* (!)—perhaps in twenty years." An item of news which will strike with joy all who have attempted to lead a literary life in Berlin, is the schedule of appropriations for the Royal Library for the fiscal year 1883–4, and which we commend to Congress for imitation: "For purchase of the Niederländisches Palais [which, we may remark, is situated Unter den Linden, next the King's palace], $650,000; for rebuilding the same for library purposes, $102,500."

—Three works of considerable importance have recently appeared in Germany on the organization of society in the middle ages. The first is Professor Gengler's 'Deutsche Stadtrechts-Altertümer,' an octavo volume of 515 pages. It is designed to give a picture of the interior life of the German cities during the period under review, and is perhaps the most important contribution to our knowledge of the subject since the appearance of Arnold's 'Verfassungsgeschichte der deutschen Freistädte' in 1854. Since G. L. von Maurer brought together the materials which have made his work so famous, a vast number of explorers have been engaged in search of new information in the same field. Only to mention the most prominent names, contributions to the literature of the subject have been made by Ennen, Frensdorff, Hegel, Heusler, Kriegk, Lörsch, Rosenthal, Schmoller, and Schönberg. Gengler has not only availed himself of the works of his predecessors, but he has discovered a vast amount of new material, and has wrought the whole into what the Germans, at least, would call a popular form. It may be described as a picture of the mediæval German city. In the first part, chapters are given to "Walls," "Gates," "Towers," "Streets," "Squares," "Bridges," "Mills," and other objects of strictly material character. The second part is devoted to the growth of municipal institutions, and consists of a series of discussions, nine in number, ranging all the way from the considerations that led to the location of the city to the organization of the several municipal and trade brotherhoods. Of especial interest and value is the eighth "excursus," in which the author discusses the rise of the merchant guilds. Though he has availed himself of information previously discovered, he has everywhere founded his conclusions on the solid basis of original materials. An Appendix, pp. 478–505, gives, in alphabetical order, a very copious list of the printed and unprinted sources used.

—Of similar import and thoroughness, though of far more limited scope, is the work of Gramich entitled 'Verfassung und Verwaltung der Stadt Würzburg vom 13. bis zum 15. Jahrhundert.' The author announces that his present production is merely a forerunner of an elaborate work on the constitutional and administrative peculiarities of that singular old city. The thin volume presented is largely devoted to an account of the organization and duties of the municipal council, but the discussion is so ably carried on as to give promise of a work of the first importance. A vast amount of new material has been brought to light. Of a very different nature from either of the foregoing is the posthumous volume of Professor Wilhelm Arnold. Though the work is entitled 'Studien zur deutschen Kulturgeschichte,' and is, from the circumstances of its publication, necessarily somewhat fragmentary, it is the ripest fruit of a very able and a very well furnished mind. It is made up of two groups of four essays each, the first having the general title of "Land und Stamm," and the second of "Stadt und Staat." Though the first four essays are not without considerable importance, it is in the second series that the investigator will find the largest rewards for his reading. Of especial value are the first and fourth studies of the second book—"The Rise of the Trades-Unions in the Middle Ages," and "The Reception of Roman Law and its Results."

—The 'Gilda Mercatoria,' by Dr. Charles Gross (Göttingen: Deuerlich), we understand to be a dissertation upon taking the doctor's degree by an American student in Göttingen. It is a thorough and luminous discussion of an obscure subject. The title-page calls it "ein Beitrag zur Geschichte der englischen Städteverfassung"; and the main purpose of the discussion may be called negative—to prove, against Brentano and others, that the English municipal government did not have its origin in the Merchants' Guild. This the author appears to have established, showing very clearly that, in the fully-developed municipal constitution, the guild and the municipality were distinct organizations; and if the evidence as to the origin of the municipality is not so complete, it may be noted that, assuming the other point to be proved, the burden of proof for the earlier period rests upon those who maintain the theory which he controverts. Nor is his positive evidence here scanty. He examines the two strongholds of the opposing theory—the *Judicia Civitatis Londoniæ* and the Berwick Statutes—and shows that they give fair support to his view. He controverts, and we think correctly, Brentano's opinion that England was "the birthplace of gilds," and, assuming that the Merchants' Guild was a creation of the period after the Conquest, maintains that it had no prototype in the Anglo-Saxon period, unless in the *Cnihtegilde*. He also emphasizes (p. 70) a point of the first importance in this branch of historical study, but which is frequently overlooked—that municipal history passed through very different phases in England and on the Continent: "There was in England no Commune as in France and Flanders, no development of a Conseil (*Rath*), and no contest between Patriciate and Craft-Guilds (*Zünfte*) as in Germany; no 'summum convivium' as in Denmark, and especially no Imperia in imperio as in Italy." Brentano's work, of course, remains the most complete statement in English of the history of guilds, and, in connection with Mr. Toulmin Smith's 'English Gilds,' of which it forms the introduction, must be the starting-point for any study of the subject; but Dr. Gross has criticised Brentano's conclusions on several points, and no student of the subject can afford to neglect this treatise.

—The centennial anniversary of the foundation of the Russian Academy was celebrated last November in St. Petersburg. This Academy was created by the Empress Catharine II., and existed as an independent institution, side by side with the Imperial Academy of Sciences, founded by Peter the Great, down to 1841, when Czar Nicholas merged it with the latter Academy and made it its Second Division, devoted to the Russian language and literature. The other two divisions are the mathematico-physical and the historico-philological. The Academy of Sciences, founded in 1724, but opened only in the beginning of 1726, after the death of Peter, was destined to become the seat of imported learning, represented chiefly by German scholars, and it remained so for more than a century. Among its foreign members who were assigned a pleasant sphere of activity in the Russian capital were the two Bernouillis, Euler, S. G. Gmelin, Pallas, Schlözer, and a host of other distinguished names. German, French, and Latin were the languages in which the works of the academicians were published. Among the native members was Lomonosoff, who was one of the first Russian writers to rebel against the leadership of foreigners in the highest spheres of intellectual, as well as governmental, life in the Empire. To call the domestic mental powers and energies of the nation into activity, by developing the latent capabilities of the vernacular, adapting it to the various scientific and literary purposes, and popularizing its products, as well as the history of the country, was the aim of Catharine II. in creating, in 1783, the Academy to which she applied the distinctive epithet Russian, while the older was to continue cosmopolitan in its purely scientific character. And to this day most of the greatest names of the Academy of Sciences are still non-Russian—witness I. J. Schmidt, Klaproth, Frähn, Castrén, Von Baer, Lütke, Böhtlingk—while the Russian Academy started with such popular national names as Derzhavin and Prince Shtcherbatoff, and in the earlier half of this century included among its members the

historiographer Karamzin, the poets Zhukovski and Pushkin, and the statesmen Speranski and Uvaroff. The first president of the Russian Academy was a lady, Catharine's versatile friend and helper in ascending the throne—the Princess Dashkoff. Paul I., however, banished the Princess to Siberia on account of her part in the catastrophe in which his father lost both throne and life, and deprived the Russian Academy of its resources. Alexander I. reorganized it, but Nicholas, by uniting it with the Academy of Sciences, in order to nationalize the latter, diminished its prestige. As Second Division of the Academy of Sciences, it has received few celebrities of the first rank. The number of members has dwindled down to less than a dozen.

—One of the first tasks of the Russian Academy was the elaboration of a Russian dictionary, which was to be for the Empire of the Czar what the 'Dictionnaire de l'Académie Française' was for France. The poets Derzhavin, Von Visin, and Kniazhnin were among the contributors, and the Empress Catharine herself wrote "supplementary remarks" to the first volume. The work was completed, after her death, in six volumes (1789-99), and contained forty-three thousand words. But it disappointed expectations, and had to be worked over during the reign of Nicholas. Among the other earlier publications of the Russian Academy were writings on Russian grammar and prosody, a Russian Iliad, collections of the Byzantine and west-European chronicles, and works of travel. Among the most active members under Alexander I. and Nicholas were the historians Karamzin and Ustrialoff, whose voluminous publications illustrated the earlier and some of the later periods of the national history. The despotic jealousy of Nicholas excluded from the institution all talents tainted with the suspicion of liberalism, and even under Alexander II. the election of the liberal literary historian Pypin as successor to the ultra-loyal Ustrialoff had to be undone, Pypin being requested to find a pretext for declining it. To the period of Alexander II. belong the philologist Vostokoff, author of a Church-Slavic dictionary and other works of great merit, and the Panslavic agitator Pogodin. Among the present members are the Slavist Grot and the grammarian Buslayeff. The Second is now considered the least distinguished of the three divisions of the Academy of Sciences. The celebration took place under the auspices of the Academy in general, in the presence of its President, Count Tolstoi—the Minister of the Interior—and of the members of all of its three divisions.

BOOKS ON SPAIN.

Spanish Vistas. By George Parsons Lathrop. Illustrated by Charles S. Reinhart. Harper & Brothers. 1883.

Seven Spanish Cities, and the Way to Them. By Edward E. Hale. Boston: Roberts Brothers. 1883.

From the Pyrenees to the Pillars of Hercules. Observations on Spain, its History and its People. By Henry Day. G. P. Putnam's Sons. 1883.

Spanish Ways and By-ways. With a Glimpse of the Pyrenees. By William Howe Downes. Illustrated. Boston: Cupples, Upham & Co. 1883.

A Family Flight through Spain. By Miss Susan Hale. Fully illustrated. Boston: D. Lothrop & Co. 1883.

DR. JOHNSON, when counselling Mr. Boswell not to publish an account of his travels upon the Continent of Europe, used this argument: "The world is now not contented to be merely entertained by a traveller's narrative; it wants to learn something." Johnson had refrained from giving an account of his own travels in France, because, as he said, he was afraid of the ridicule his book might excite. He had been but two months in France, and many of his intelligent readers, he thought, had seen more of the country than he had. Since Johnson's time, however, great progress has been made in the art of book-making; so that now, with the aid of guide-books and cyclopædias, the traveller can in a very few weeks gather materials for a book of almost any size upon almost any country. We doubt if the sensibility of the modern book-maker is likely to be disturbed by any fear of ridicule.

The five books before us are the productions of as many happy tourists, each one bent on having a "good time" and on making a book descriptive thereof. To have a "good time" is the essential purpose of the whole tourist class. It is a laudable purpose, although, when joined to book-making, it is apt to beget a flippancy of style which, while well suited to recording the ordinary annoyances of journeying and the smart sayings of travelling companions, is clearly belittling to the graver subjects of history, art, religion, and architecture. Mr. and Miss Hale, Mr. Lathrop, and Mr. Downes entered Spain from the north, at Irun, and thence proceeded to Burgos, Madrid, Toledo, Seville, Cordova, Granada, and Saragossa, making "side excursions" to places of lesser note. Mr. Day, starting from Barcelona, moved onward to the cities above named, and even to the fortress of Gibraltar. They visited the palace and picture gallery at Madrid, the cathedral at Burgos, the cathedral and the Alhambra at Granada, the mosque at Cordova, the alcazar and cathedral at Seville, the alcazar and cathedral at Toledo, the cathedrals at Saragossa, etc., etc. Their books contain descriptions of these wonders of architecture and art, observations upon the manners and customs of the Spanish people, scraps of history and romance, and hints for the guidance of tourists following in their footsteps. Those who have seen Spain in the route travelled by Mr. Lathrop and the other excursionists will find in these books some pleasant reminders of their own experience. They will, besides, find many statements misleading to the unwary, and many strange mistakes (we wish we could class them all under the head of "typographical errors"); but they will admire withal that so much work could be performed in six weeks' time.

"Spanish is what school-boys call 'hog Latin,'" says Mr. Hale. "It is a very beautiful language," says Mr. Downes. "Some acquaintance with the Italian language may facilitate the study of Spanish," says Mr. Lathrop. Not so, says Mr. Hale: "If by any misfortune you know any Italian when you go to Spain, forget it. It is only a snare and a delusion." Mr. Downes finds the lack of a good guide-book a "real misfortune," the most noted ones being "faulty and untrustworthy in many particulars." Mr. Hale is "sure that the men who made Murray's [Ford's] first volume and O'Shea's book do not appreciate the fine features of the country or the fine qualities of the people," and Murray's second volume seems to him to be "overrated." Mr. Day, with praiseworthy candor, says: "We wish to acknowledge our obligations to Ford's book on Spain, which is one of the most thorough and reliable books on that country, and a most complete guide to the traveller. We have not scrupled to use the facts collated by him with the utmost freedom." The hotels were much to Mr. Hale's liking, and he sums up his experience in these words: "Outside of the Tremont or the Parker House, or half a dozen of such American hotels, I could nowhere in America have been as attentively or practically as well served." Against this Mr. Downes would make it out that Spain is "almost destitute of good hotels"; and Mr. Lathrop, with manifest bad taste, writes down one hotel as the "nadir of dirt and unsavoriness," the "stronghold of dirt," and another as taking "the palm for extortion."

Mr. Downes, Mr. Day, and Mr. Lathrop give to the bull-fight a prominent place in their books. One description of a bull-fight is very much like another. Opinions differ as to the morality of the exhibition. Mr. Downes, who "went twice," found the sport in most respects "thoroughly enjoyable," and he says that "after the first shock is past there is a peculiar and exceptional fascination about it. There is nothing like it." If we can credit Mr. Lathrop and Mr. Hale, who say that the exhibition has been given for the benefit of the Society for the Prevention of Cruelty to Animals, it has a saving feature hitherto unrecorded. The Hales kept away from the bull-fights; compelled to "draw the line somewhere," they drew it just there—and then, "to show the cruel and bloody nature of the sport," Miss Hale inserts a number of full-page illustrations, and thereby, as we think, misses her mark, these pictures representing a show more cheerful than otherwise.

It comes in the way of our tourists to expound the Salic law, and this they do with a show of knowledge inadequate for so weighty a subject. And first, Miss Hale:

"All Spanish prejudice was, and is, in favor of the Salic law, by which a woman can reign only in default of male heirs."

To quote Miss Hale's definition is to prove that she has not a clear idea of the meaning of the term "Salic law," for by that law females are excluded, absolutely, from succession to the crown. One of a great many mistakes made by Miss Hale in her "Historical" chapter, is the making "Don Carlos, born in 1788," the nephew of Ferdinand VII.: he was the King's brother. To say that he "had an absolute right to the throne in default of male heirs," is only a feeble Carlist plea. And further, Don Carlos's claim was that he was *the* male heir. Next, we will hear Mr. Day:

"This law [the Salic], which always prevailed in France, never prevailed in Spain until the time of Philip V., in 1750, when he ordained it as the law of Spain, and it so remained until about 1832."

Now, 1750 was not "the time of Philip V.," for that monarch died in 1746. But admitting that the Salic law was "ordained" in Spain by the Bourbon prince at an earlier date, it did not "so remain until about 1832," for it was abrogated by Charles IV., with the sanction of the Cortes, in 1789, and not until 1812 was it reëstablished. Finally, Mr. Hale:

"Her [Isabella II.] title at Spanish law was none of the best. Women had not succeeded since Isabella the Good, and it was not until it was clear that she was to have no brother that the edict was made just before she was born, in 1830, reversing all old laws of succession, by which she became Queen when she was really an infant three years old."

If "women had not succeeded since Isabella the Good," it was not because of ineligibility. Women were eligible to succeed to the crown all through the 16th and 17th centuries; and, as a fact, Isabella the Catholic was succeeded by Queen Joanna. The edict of Ferdinand VII. did not reverse "all old laws of succession," but only restored the ancient laws. We will not ask Mr. Hale how it was made clear, "before she was born," that Isabella "was to have no brother." Certain it is that the wife of the Duc de Montpensier is her younger sister.

Mr. Hale deals severely enough with Isabella II.—"Isabella the Bad" is the title he bestows upon her; but for her son, the present King, he has a first-rate notice. "This young man," he says, "has already, in eight years, shown more wisdom than all his ancestors together have shown in three centuries and a half." He does not give full credence to charges of corruption brought against the Spanish administration, because in his own country he has heard similar charges brought against "our administration," while he knows that "in fact, however it might be improved, it is the best administration that has ever been attained in the world, and the most economical."

If to Mr. Downes's eyes the Granada cathedral was a "most repulsive structure," the "numerous mean chapels full of tawdry ecclesiastical bric-à-brac and impossible works of art," to Mr. Day's a "noble structure," and to Miss Hale's "very beautiful" interiorly, the fact that tastes differ will explain it all. But we find in these books many positive errors—errors which a little care might have corrected. For a specimen of loose writing we turn to page 147 of Mr. Day's book: "Here [Granada cathedral] also is the coffin of Prince Miguel, the eldest son of Crazy Jane, and who, at the age of twelve years, was killed by a fall from his horse near Granada." Mr. Day's guide-book should have informed him that Prince Miguel was not the son of Jane, but of the Queen of Portugal (her sister), and that his death occurred before he had completed his second year. On the same page he styles Miguel the "elder brother" of Charles V. And "in this connection" we may say, correcting Mr. Day, that Catalonia does not "constitute the northwestern portion of Spain," but more properly the northeastern, and that "Henry IV. of France" was not born in Toulouse, but in Pau. And now we too must "draw the line somewhere," and we draw it where Mr. Hale (p. 248) measures distance by "kilograms."

GEORGIA BEFORE THE REPUBLIC.

The History of Georgia. By Charles C. Jones, Jr., LL.D. Boston: Houghton, Mifflin & Co. 1883. 2 vols., pp. 556 and 540.

In these two handsome and well-printed volumes Mr. Jones has done for Georgia what Brodhead did for New York and Palfrey for New England. He has given us a history of his State during the colonial period, and down to the close of the Revolutionary war, which is most elaborate, careful, and exhaustive. It is fairly entitled to be regarded as a final presentation of the subject, for, with one exception, there seems to be no topic and no incident which has not received the minutest scrutiny and most thorough treatment. It is remarkable that Mr. Jones has been able to find so much to say, for the brief colonial history of Georgia is singularly barren, and offers but scant material for the historian. Yet Mr. Jones has avoided the error of many of our local historians by eschewing the field of general history, and confining himself strictly to his subject. He has filled his pages, not by padding, but by the careful narration of every incident, and by the skilful insertion of all important original documents, which render his book a storehouse of facts, and give it the highest authority.

The first volume is devoted really to the period of settlement. This could, indeed, hardly be otherwise, for the years which intervened between the departure of Oglethorpe and the beginning of the troubles with the mother-country offer in Georgia hardly anything above the level of a parish record. The story of the settlement is susceptible of very interesting narration. Among the countless utopian and impracticable schemes devised or attempted as experiments in government in the American wilderness, that to which Georgia owes its origin is very conspicuous. It involved not only the problem of building up a State with the inhabitants of debtors' prisons, but of conducting the commonwealth thus constituted on the principles and in accordance with the rules of a charity school. The object was most benevolent, the intention of the trustees most moral; but neither, when embodied in laws and constitutions, was calculated to develop a strong and vigorous State. The wonder is not that Georgia, the subject of a fostering and meddling charity, did not thrive, but that she survived at all. That the colony lived on until the trust was abolished, and then passed to the crown and began a natural and vigorous growth, was owing to the character and ability of one man, General Oglethorpe.

Among all the founders of States, there are few nobler figures than that of this old soldier and stanch Jacobite, who in his boyhood shot snipe in Conduit Street, in the days of William III.; served with Prince Eugene, was complimented in the verses of Pope, and lived to excite the admiration of Johnson and find a place in the letters of Horace Walpole. He was a single-minded, brave, and honest gentleman, a good soldier, and an efficient administrator. His successful wars in behalf of his infant colony have an almost romantic interest, and it is pleasant to find that Mr. Jones does full and ample justice to the man to whom Georgia owed her existence. Posterity does not even yet fully appreciate Oglethorpe. We have statues to men who do not deserve them, but none, we believe, to the man who founded a commonwealth which is destined to be the richest and most powerful of our South Atlantic States.

The career of Oglethorpe is enough to make any story with which he is connected interesting, but there were others who came with him—John and Charles Wesley, and subsequently Whitefield—whose presence lends a strong personal attraction to the history of the early days of Georgia. Here, too, Mr. Jones has done full justice to his subject, and his treatment of the three missionaries and of the troubles in which these great religious leaders were involved strikes us as extremely correct and candid. The close of the Oglethorpe administration was followed by an uninteresting period of common place development, accompanied by the rapid growth of material prosperity and the wrangles with the royal Governors usual in all the English colonies in America. In the second volume, however, which is devoted to the history of the State during the War of the Revolution, there is "metal more attractive." Georgia was tossed to and fro in the struggle for independence. The last of the colonies to shake off the grip of England, in consequence of the exertions of an exceptionally strong Governor, Sir James Wright, the State passed at first entirely into the hands of the patriot party. Thence she was wrested by the British forces, and was the only colony which England succeeded in regaining and holding until the end of the war. The result was that Georgia suffered terribly. The active part taken by the Southern loyalists resulted in that region in a bitter partisan warfare of the most fratricidal kind, which was marked by desperate fighting and many bloody deeds, and which was almost unknown north of the Carolinas. Georgia had her full share of this savage warfare, but, although it was very dreadful and mournful at the time, it affords an excellent subject for the historian. Such a conflict abounds in deeds of personal daring, in hair-breadth escapes and exciting episodes. Mr. Jones has made the most of his opportunity, and has given us a volume which is most instructive as to the character of the war for independence in the extreme South.

There is one grave omission in the book. Mr. Jones has not attempted to depict the manners, customs, character, and qualities of the people. It is true that society in Georgia was extremely crude, but still there was a society and a population, and in a work of this sort the most important thing is to know what the people were and how they lived. It is this which throws more light on the development of the United States than anything else, and it is the work of all others which the local historian of a State should perform with the utmost completeness. Mr. Jones has such an exhaustive knowledge of his subject, and has searched and sifted his material so thoroughly, that he has a peculiar fitness for the task, and a preparation which no one else can hope to have. It is to be hoped that he will, in the volumes yet to come, repair this oversight at the outset, and give us a comprehensive picture of life and society in Georgia at the close of the Revolutionary war. With the single exception of this important omission, there is nothing to be said of the book except in the way of praise. It is an important and valuable contribution to American history.

AMONG THE MONGOLS.

Among the Mongols. By the Rev. James Gilmour, M.A., London Mission, Peking. London: The Religious Tract Society.

Although, in its primary object of making converts to Christianity, missionary enterprise in these days does not appear to achieve much success, there can be no question that it adds largely to our knowledge of the various races with which the earth is peopled. A missionary, in order to carry on his work at all, must establish friendlier and more intimate relations with those whom he addresses than are essential in the case of any other visitor. He must acquire a mastery of the language; he must lay aside, as far as possible, the modes of life in which he has been brought up, and adopt those of the people to whom he has been sent. He must train himself to look at life from *their* point of view; to disencumber himself of his own prepossessions, and appreciate the nature and strength of theirs. A missionary who has succeeded in fulfilling these arduous conditions has gone through the best of all trainings for becoming a trustworthy exponent of the character, customs, and every-day life of a distant and unfamiliar country. Mr. James Gilmour's long residence in Mongolia would seem to have been unrewarded by the gain of a single convert to Christianity, but he worked hard at the language, he lived continuously among the people, and in the volume before us—the record of his manifold experience—he has given a detailed and highly interesting account of the present condition of a race which six centuries ago were the agents of the vastest and most terrible calamity that has ever smitten the human race. If Buddhism had accomplished nothing beyond the transformation of the inhabitants of Mongolia from the ruthless destroyers of the days of Jengis Khan to the humane and inoffensive barbarians described by Mr. Gilmour, it would have rendered an immense service to humanity.

Notwithstanding this improvement in their moral character, to live "among the Mongols" is to live in the midst of very undesirable society. The discomforts of any one condemned to exist in this painful purgatory begin as soon as he approaches a Mongolian tent in order to enjoy the company of those within. It is incumbent upon such an one to stand at some little distance

and shout the Mongolian for "dog," in a voice of thunder. Thereupon a dozen or so of large and ferocious dogs rush howling forth, and make for the visitor at the top of their speed. His safety now depends upon the swiftness of the human inhabitants of the Mongolian residence. These may succeed in heading off the dogs before they have devoured the morning visitor; but also they may not. In anticipation of the latter contingency it behooves the ill-fated personage who lives "among the Mongols" to take with him two sticks. The Mongolian dog is, luckily, lacking in intelligence, and he flies headlong upon one of these sticks, and "worries" it under the impression that it is an integral portion of the morning visitor—that individual laying about him, meanwhile, with the other stick until the dogs discover that the neighborhood is too hot for them. Assuming that this first controversy has been decided in favor of the visitor, matters cannot be said to look very much brighter when he is safely ushered into a Mongolian tent. The Mongols never wash any part of their persons except their faces, and that in a highly superficial fashion. They are nerved to the practice of this rigid abstinence by prudential considerations. They are Buddhists, believe devoutly in the transmigration of souls, and are of the opinion that any Mongol who makes an immoderate use of water in this life will enter into the body of a fish in his next stage of existence. The consequence is that a Mongol not affected with some cutaneous disease of a contagious character would be a phenomenon in Mongolia almost as startling as a Mongol with a Roman nose. And as their habits are gregarious, and many more Mongolians will crowd into a tent than the tent can legitimately accommodate, though a visitor may have passed scathless through the dogs, it is well nigh impossible that he should emerge scathless from a Mongolian habitation.

The Mongols, it must be acknowledged, are hospitable, but it is difficult to read without terror the special manner in which they exhibit this virtue:

"They were," writes Mr. Gilmour concerning one of his visits, "preparing for next day's feast. In the tent of my host they were making *bauch*. This is made by mincing mutton very small, mixing it with salt and chopped vegetables, and doing it up in small nuts covered with a casing of dough. The amount of manipulation necessary before the nut is complete, and the unusual cleanness of the Mongols' hands *after* making it, always made me shudder when I saw them about to honor me with this delicacy."

The Mongols appear to indulge in only one "square meal" daily; and their method of eating this is decidedly dangerous when practised by a European. Forks do not enter into their domestic economy, the Mongols finding in their teeth a sufficient substitute. A Mongol takes a piece of meat in his left hand, seizes it with his teeth, and with a knife in his right hand cuts it off close to his lips. If a western man were to attempt this alarming manœuvre, he would indubitably slice off the top of his nose. The flatness of the Mongolian nose enables the Mongol to accomplish it in safety. Here, by the way, is a subject which might worthily attract the attention of some follower of Mr. Darwin. Is the flatness of the Mongolian nose to be accounted for as a natural process of attrition consequent upon this method of eating pursued through countless centuries? The Slawkenbergian character of the European nose never fails to make a profound impression upon the Mongolian imagination. It will hold a Mongol spell-bound, like the "glittering eye" of the Ancient Mariner, and after long gazing at this fascinating feature in the face of some newly arrived foreigner, a group of Mongols will disperse remarking to each other: "What a tremendous nose!" There is one day—the last day of each year—on which the Mongols depart from their practice of eating only one meal, and then they eat seven dinners in rapid succession, one after the other. Mr. Gilmour, on one occasion, came in for one of these Brobdignagian banquets.

"I rather liked this idea at first, as the custom in the north of Mongolia of only one meal per day, and that after dark, with nothing but tea, tea, tea, the whole day long, does not seem to suit an European as well as a Mongol. My satisfaction, however, was short-lived, for I soon discovered that they had made up their minds that I should do justice to the whole seven, and that a sly old yellow-coated lama on my left had installed himself as tally-keeper to the guests. As the day wore on, matters began to look a little serious. The solemn voice of the man in yellow had only pronounced *three!* What was to become of the remaining four? As I was wondering how I could best get out of this difficulty, deliverance came in an unlooked-for way. Some one sitting in a tent about a dozen yards off shouted, 'Ocher, come and drink wine'; and Ocher, though as a lama he had vowed to abstain from wine, and just then was employed in counting my dinners, at the summons disregarded his vow, threw up his office of tally-keeper, and the next time we saw him was in too genial a frame of mind to find fault with any one for their shortcoming in the past."

Mr. Gilmour acknowledges that he never saw a Christian Mongol, and this is not surprising. It is impossible to imagine a more unpromising subject than a Mongol on which to attempt the operation of conversion to a new faith. The Mongol toils not, neither does he spin. He does nothing; he knows nothing; and he does not want to know or to do anything. To be a Buddhist is to possess the sum total of all that any reasonable person can desire. If a man has money, he ought to spend it in acquiring merit, by donations to temples and shrines, gifts to lamas, and the like virtuous acts, and not seek to increase it by trade, like a wordly-minded Chinaman. If a man wants to travel, he can turn the inclination to profitable account by making pilgrimages without ceasing to sacred places, instead of wandering aimlessly about the world like a demented Englishman. Living in the midst of barbarism, filth, cutaneous diseases, and squalor unspeakable, the Mongolians look upon themselves as the one race which has solved the riddle of existence aright. They are satisfied to rest upon this achievement, and the supineness to which they have brought themselves by a sedulous cultivation of this feeling of self-satisfaction is shown in the fact that even the courage which must have animated the followers of Jengis Khan has given place, in the Mongolians of to-day, to a contemptible cowardice.

"Not long since," writes Mr. Gilmour, "a perfect stampede was created in Central Mongolia by the report that travellers had been seen travelling together in a body. Everybody fled; flocks and herds were driven off, heavy goods abandoned, and a large district left without inhabitants. The panic overtook a caravan in which were some travellers in camel-carts. The camel-carts were left in the desert, and the whole company fled to the hill country. For some weeks the Russian post was interrupted, and things looked serious. It was afterwards discovered that it was all a mistake. The supposed robbers were a few people going to Urga to pray—so few that even had they been robbers of the bravest, a tithe of the men who fled might have driven them off; and the whole flight might have been prevented had there been found one man with bravery enough to reconnoitre the supposed enemy."

A people that wants nothing but to remain as it is, that is moved only to a feeling of moral repulsion by the exhibition of energy, industry, perseverance; that is entirely convinced of the efficacy of the prayer machine; that believes that sin can be got rid of by the acquisition of "merit" obtained through the medium of mechanical contrivances, does not present a hopeful field for missionary enterprise. And the missionaries further enhance the difficulty of the undertaking by using the Bible as though it were a talisman which worked conversions by the simple act of reading it. The Bible has been translated into Mongolian—genealogies and all—and Mr. Gilmour reluctantly confesses that the most learned lamas find themselves utterly incapable of comprehending the meaning of a single chapter. It has, in all probability, been "translated" after the fashion of Bottom the Weaver, and reduced to nonsense in the process. But what missionary zeal has signally failed to accomplish, it would appear that the Russian Government, working after a very different fashion, will accomplish at no distant date. Contrasting the effect upon the Mongolian of Chinese and Russian influence, Mr. Gilmour writes:

"At every point where the Chinaman and the Mongol come into contact the Mongol seems to be rendered even more helpless than he is. The influence of Russian contact is more healthy. It elevates and develops the Mongol. English travellers in Siberia sometimes sneer at the Russians there as being only half civilized. But it is the primitive simplicity of their style and manner of life that enables them to elevate the Mongol. Some of the Russian poor live very rudely. The difference between them and the Mongols is slight. The first upward step to be made in the social scale is so low that many make it, and once begun they go on. Buriats (a Mongol tribe) till the ground, work at handicrafts, and engage in trade, just as the poorer Russians do. Russians and Buriats live together on good terms, eating and sleeping together. The Buriats learn the Russian tongue, go to Russian schools, know what the Russians know, have all their aspirations in the direction of agriculture, manufactures, trade, learning, and Government service, fostered by the Government; and it is no uncommon thing to meet with respectable men, educated, intelligent, and wealthy, who were born mere Mongols, but who have been elevated to the civilization and intelligence of the nineteenth century by the happy influence of the judicious measures adopted by the Russian Government for the amelioration of the condition of its more lowly subjects. . . . Successful young [Mongols] who acquire position and culture are usually anxious to marry Russian ladies, and not a few accomplish their wish. . . . Russia has toleration for all religions, but the gravitation is towards the Christianity of the Greek Church, and, though it is by no means necessary that an official should be a Christian, yet, as a matter of fact, many Mongols who rise in the Government service, leave their Buddhism and embrace Christianity. . . . Russian ladies who marry Mongols usually insist upon baptism as a preliminary, and in these ways the hostile attitude maintained by Buddhists to Christianity is softened down, and in place of their bigoted forefathers arises a race who are Christians as far as they are anything."

Pianoforte Music: Its History, with Biographical Sketches and Critical Estimates of its Greatest Masters. By John Comfort Fillmore. Townsend MacCoun. 1883.

MR. FILLMORE deserves the thanks of all musical people for having written a very readable book on an interesting subject. If music teachers knew how much pleasanter they could make their tasks to their pupils by letting them know something about the history of their art, they would not neglect this subject so much as they now do. The trouble is that the teachers know very little about it themselves. The lack of suitable text-books is to some extent responsible for this state of affairs; but, as far as the pianoforte is concerned, is now remedied by Mr. Fillmore's monograph, which is written in a clear, fluent style, and can be readily understood by all who are familiar with the ordinary musical terminology.

The history of pianoforte music is a fascinating illustration of the relation between science and art, and the dependence of genius on the material means for the expression of ideas. To give only one instance: At the present day all

persons who are not frightened by a big name and frankly confess their opinions, admit that Mozart's pianoforte music is tiresome to them. It could not well be otherwise. The instruments for which Mozart wrote were very imperfect in mechanism and tone. They had neither the compass, nor the brilliancy, nor the sustaining power of our modern instruments. A prolonged singing tone could not be produced on them, and for this the composer attempted to atone by a series of runs, trills, and other fancy work which to us appears perfectly meaningless and insipid; although some persons still pretend to admire it. Mozart himself, we may feel assured, would never have written in this style if he could have heard one of our modern pianofortes, with their poetic tone quality; for when he wrote for an instrument that could sustain a note, *e. g.*, the human voice, he produced works which are as beautiful to-day as they were a century ago.

Mr. Fillmore devotes a brief introductory chapter to a description of the predecessors of the pianoforte—the clavichord and harpsichord. A few woodcuts would have been acceptable here. In part 1 the first classical period of Bach and Handel is considered. Part 2 takes up successively the epoch of the development of the sonata form, the predominance of content over form in the sonata, and the transition from the classic to the romantic period (Weber, Schubert). Part 3 is devoted to the romantic period (Mendelssohn, Chopin, Schumann). In these chapters not only are the composers named treated as writers for the pianoforte, but short biographies of them are given, with general estimates as to their place in musical history. In part 4 the technic of the different periods is considered more specially, and part 5 is devoted to the minor composers and pianists of each epoch, including those who are at present most prominent in Europe and America. This classification and arrangement of topics is on the whole commendable, the most serious objection to it being the general one which applies to the words "classic" and "romantic," by means of which composers so utterly different in every respect as Bach and Mozart on the one hand and Mendelssohn and Chopin on the other are classed together. Mr. Fillmore carefully defines the sense in which he uses these terms, and he shows, not only here, but in chapter v. of part 2, which treats of the fundamental questions of musical æsthetics, an intelligence rare among English writers on such topics and a commendable avoidance of metaphysical subtleties and empty verbiage.

One point to which greater prominence might have been given is the manner in which the artificial sonata form has been gradually displaced by the shorter forms introduced by Schubert, Mendelssohn, Field, and especially Chopin and Schumann. The Irish pianist, John Field, receives a just tribute in the statement that "he fairly ushered in the romantic era by inventing the nocturne," a form in which Chopin subsequently greatly surpassed him, although his first essays in it are strikingly suggestive of Field. Another statement to which we wish to call attention is that "Moszkowski has perhaps greater genius than any of the younger generation" of pianoforte composers. In general, our own views agree so well with those expressed in the present volume that there is no need of our dwelling on them. Two emphatic exceptions may be noted—the statements that Liszt's music is preëminently sensational, and that Chopin's is often morbid. Both these views are based on a Teutonic bias. The German reduces his emotions, like everything else, to a system—first a quick, then a slow movement, and so on, each of a definite, predetermined length. Liszt's music, on the contrary, constantly changes its rhythms, its tempo, and its moods, because it is a reflection of the ever-changing sentiments of the Magyar. To call this sensational is unjust. It is simply a national peculiarity, and, to be frank, we prefer it to the German style, which, however, has been much modified by Schumann, Wagner, and other recent composers. The assertion that Chopin's music is often morbid has been so frequently made as to have become a commonplace which many critics repeat in parrot fashion. But it is one of the absurdest notions ever conceived through national prejudice. Chopin's music is dreamy and melancholy; but sadness is one of the first attributes of the highest genius. The wondrous harmonies which make this music appear dreamy to some and unintelligible to others are really prophetic glimpses of the music of the future. To a student of music they are inexhaustible gold mines, indicating the veins which the harmonic development of his art will follow. The one great *bêtise* of Mr. Fillmore's excellent book is the marginal note, "The Preludes of a morbid character." In our opinion the Preludes are Chopin's greatest works, and what has just been said applies to them in particular. They are too poetic to be played in public, and although some of them are easy enough technically, few can play them with the proper expression. If all collections of pianoforte music were to be destroyed save one, the present writer would cast his vote for Chopin's twenty-five Preludes.

In the last pages of his book Mr. Fillmore asks the question whether our present pianofortes are destined to be superseded by some future instruments with all the varieties of tone color producible by the orchestra. He might have referred here to the piano-melodium in which the manufacturer Alexandre attempted to realize Liszt's old dream of uniting the varied tone-shades of an organ with the peculiar excellences of the piano, but which failed to give satisfaction. "It is not at all improbable," says Mr. Fillmore, "that Helmholtz's well-known experiments on overtones by means of a series of tuning forks reinforced by resonators and kept in vibration by means of electricity, may point the way to a final solution. Perhaps the coming instruments may employ tuning forks instead of strings. . . ." We hardly think that this is among the probabilities. Our best manufacturers at present produce pianos whose tones are as agreeable to the ear as those of an old Italian violin, and they have remarkable sustaining powers, provided the hearer is not too far away from the instrument. The greatest desideratum in the modern pianoforte is the power to modify the intensity of a tone after it has been struck—to produce a *crescendo* and *diminuendo* without making use of the *tremolo*. To hope for this is perhaps to hope for the pianists' Millennium.

German Life and Literature. In a Series of Biographical Studies. By Alexander Hay Japp, LL.D., F.R.S.L., F.R.S.E., F.R.G.S. F.S.A. London: Marshall Japp & Co.

Two generations have passed since Mr. Carlyle, having gone to Germany and "found what he wanted," returned home and commenced scourging his countrymen for their dislike of what was currently known as German vagueness and transcendentalism. Since that time the cause which Carlyle befriended, the cause of German idealism in England, has been, upon the whole, prosperous. There may have been no general approximation of the English to the German mind, but there has been a steadily growing number of Englishmen who were willing to drop the schoolmaster's tone and approach the "empire of the air" in a studious and teachable spirit. The note of insularity which once characterized most English deliverances upon things German is now but rarely discernible in the best English writing, and the old-style criticism which supposed its task to be done when it had said, with due emphasis, I like you, or I don't like you, has given way to a scholarly examination of German thought as an historical growth to be genetically studied and understood.

In view of this gratifying tendency of the time, the appearance of a new volume upon 'German Life and Literature,' by an Englishman, has a certain alluring suggestiveness; one opens the work with high hopes of finding some fresh evidence of the growth of intellectual comity between Germany and England. Such hopes are naturally strengthened in the present case when one observes the impressive initials which Mr. Japp prints after his name, and then reads in the preface that several of the "Studies" are reprinted in amplified form from the *Contemporary* and other well-known English reviews, and that they have "had the good fortune to be well spoken of by those whose judgment the author highly respects and values." After bearing such credentials, the reader can perhaps afford to smother whatever disappointment he may feel at finding that he is to be taken over such a very familiar route.

'German Life and Literature' consists of nine chapters and 520 octavo pages. Separate essays are given to Lessing, Winckelmann, Moses Mendelssohn, Herder, Goethe, Tieck, and Novalis. A chapter is added upon "The Romantic Element in German Literature" and another upon "German Philosophy and Political Life." In all these essays, with one conspicuous exception, the writer stands upon a footing of good will and respect toward his subject, and is for the most part readable, even if the biography now and then becomes somewhat excursive and garrulous, and the criticism the reverse of subtle. The author frequently interrupts himself with long and very badly-printed quotations in German and French, and with gossip, anecdote, and controversy; all this being done in a way that indicates at once a wide range of critical reading and a defective sense of literary perspective. So much has been written about the men who are here discussed, that a reader of to-day has a right to be excused from listening to that which has often been said before, or which is in itself unimportant. Of the trivial Mr. Japp's pages are full.

Upon the whole, the essay upon Lessing and the one upon the "Romantic Element in German Literature" are the best. The oft-told and always interesting story of Lessing's life is here rehearsed again from the sources with good effect. The critical estimate is just and discriminating, although in no sense revolutionary. It is insisted upon at length that Lessing was a true Protestant and successor of Luther; that the poet in him cannot be separated from the theologian and thinker, and that a unity of moral purpose runs through all his work. The proposition of a later essay, that we may "find in Lessing all the leading ideas for which the Romantic school contended" is hardly worth Mr. Japp's laborious defence of it. One shrinks at last from assenting to a line of argument that requires one to fancy Lessing among the contributors to the *Athenæum*, perhaps writing Friedrich Schlegel's essay "Ueber die Unverständlichkeit." The essays upon Tieck and Novalis are excellent unless we take exception to them for being overloaded with biographical details that lead nowhither. The chapter upon the "Romantic Element in German Literature',

is an attempt to deduce Romanticism historically; to find its beginnings in Herder, or even in Winckelmann and Lessing, and to follow it through the storm-and-stress down to the time of the Romantic school. To such as are familiar with the work of Haym, of Julian Schmidt, or of Brandes, Mr. Japp's treatment of Romanticism will present little that is new or suggestive. To others it will be useful, although its value is impaired historically by its complete silence concerning the prodigious influence of Rousseau, and critically by its violent hatred of Goethe.

It is in the essay upon Goethe that Mr. Japp's *Tendenz* as a critic appears in the strongest light. This essay is the longest in the book. It occupies more than a hundred pages, and is one long castigation of its subject. Indeed, throughout the entire volume Mr. Japp leaves no opportunity unused to show that he conceives his special mission in the world as that of a Goethemastix. At the end of his protracted examination the court finds (p. 378) that "Goethe is thus one of those who suffer from closer acquaintance. He is egotistic, self-conscious, vain and affected; one might also say that he is self-indulgent, prurient, and selfishly vicious." The court, however, is no coward that dares speak speak plainly only of a dead man that cannot defend himself; for after "turning away" from Goethe "with a sense of something inexplicably coarse, gross, and sensual in the grain of him," the stern judge continues: "We should have written precisely as we do now were he still alive to pit his patronage and power against us for such words." The essay discusses Goethe's kaleidoscopic loves in thirty pages, now with pathos, again with bathos, and always with indignation. In spite of all, however, Mr. Japp cannot quite bring himself to admit that Mr. R. H. Hutton's epithet of "spooney" as applied to Goethe was exactly the thing. By way of summing up Goethe's literary activity Mr. Japp writes, with curious chronological somersaults, (p. 300): "After a period of ultra-classicality he see-sawed betwęen ultra-Gothic, as seen in parts of 'Faust'; sentimental and morbid or semi-psychological experiments, as seen in the 'Elective Affinities' and 'Wilhelm Meister'; Greek affectations, as seen in 'Tasso,' and sickly, overreal, though elaborate, records of personal episodes, as seen in the 'Roman Elegies.'" Several pages are given to a singularly perverse discussion of *Das Dämonische* and *Naturkräft* (*sic*) as exhibited in Goethe's life and works. "'Wilhelm Meister' is one of the most shameless, prurient, and debauched of modern productions; and author, translators, and euphemistic commentators and *claquer*-choruses (*sic*) have one and all shown themselves . . . deficient in 'mental chastity.'" And so on through page after page of polemic directed against the "Goethe-worship" of Carlyle and Lewes.

Fichte once said that it is not every one's affair to study philosophy, and so we may say that it is not every one's affair to write essays upon Goethe. One does not need to be a "Goethe-worshipper" in order to feel very sure that any useful critic of the man must in these days possess an intellectual equipment very unlike that of Mr. Japp. Such a critic must have his eyes open to numerous other issues than the half-dozen regrettable priapisms of Wilhelm Meister, or the old talk about Goethe's heartless experiments upon women. There is doubtless room in the world for several opinions on every subject, but it may be safely said that one who at the present time quotes with approval Börne's remark that "Goethe narrows because he is narrow," or who finds in the poet's later years a "peculiar atrophy of healthy creative power," is not quite the man to further his countrymen toward a better understanding of Goethe. *Nur Liebe hat Verständniss.*

As a specimen of book-making, 'German Life and Literature' is the opposite of irreproachable. A table of six errata is given, apparently as specimens of the mistakes which ought to have been corrected on every page. The three short mottoes prefixed to the essay upon Goethe contain ten misprints, and the essay itself many scores of them. Mr. Japp trips not seldom in minor statements of facts and in his translations. On page 281 the old error is repeated that Goethe returned from Strasbourg as doctor: it should be licentiate. On page 444 Fr. von Hardenberg is said to have gone to Jena in 1789, where he had Fichte for a teacher and was greatly influenced by the *Wissenschaftslehre*. He went in the autumn of 1790. Fichte was not appointed to the chair of philosophy in Jena until the end of 1793, and the beginning of his influence upon Von Hardenberg dates from 1796. Page 371, in a passage quoted from Rosenkranz, Goethe is accused of the "cultivation" in his later years "of the (*sic*) eastern *manners*." Query: Does the original read *Weisen*? At any rate, the Orientalism in Goethe's "manners" is a point that has not been much dwelt upon hitherto by his biographers. But most delectable among several delectable achievements of translation is the repeated rendering (p. 360) of *Knabe Lenker* as the Boy *Lenker!*

BOOKS OF THE WEEK.

THE SOCIAL IDEAL.—A Lecture by W. M. Salter before The Society for Ethical Culture of Chicago.

For sale by G. P. Putnam's Sons. Price 10c.

The Nation.

NEW YORK, THURSDAY, JANUARY 10, 1884.

The Week.

THE year 1883 will long be remembered as a period of continuous decline in prices, resulting in an increase of 50 per cent. in the number of failures in the United States, and 70 per cent. in their aggregate liabilities; a year in which the expansion of the railroad system suddenly decreased from the building of nearly 12,000 miles of railway in 1882 to 6,600 miles in 1883; a year of liquidation and contraction of enterprises. These phenomena were reflected in the money market by the distrustful attitude maintained by capital toward investments of any sort, whether in the share capital of corporations or their first-mortgage bonds, and also in the distrust of all mercantile credit, as manifested in the extreme discrimination exercised in the discount of mercantile paper, and the preference for loans on collateral security even at rates so low that it was at times scarcely worth the trouble and risk of making loans at all. Moreover, in the last few weeks it has appeared that the Northern Pacific Railroad and the New York, West Shore & Buffalo have each cost about $7,000,000 more than their original estimates, while the New York & New England, the Ohio Central, and several others have been placed in the hands of receivers, and the promoters of these enterprises have all suffered greater losses than was presumed possible a few months ago. On the other hand, there is still an unusual exportable supply of grain and cotton products in the United States. The stocks of grain in store at the West, and of cotton at the sea-ports and interior towns of the United States, are larger than ever before, and the movement of these within the next six months, even at low prices, must do much toward the restoration of confidence, by giving the railways large earnings, and increasing the credit balance due to the United States from Europe.

The sudden and complete reversal of public opinion regarding Mr. Henry Villard, consequent upon the discovery that of all losers by the reaction in Oregon and Northern Pacific shares he has been by far the heaviest loser, and that his loss has been made total, or nearly so, by his endeavors to save others from loss who had invested in those securities by reason of their faith in him, is one of the most noteworthy features of a troubled time in the world of finance. Here is a man who has handled nearly or quite one hundred million dollars of other people's money within the space of four years. Much of this was put in his hands without other security than his personal receipt. Fortunes were made in the earlier enterprises which he planned, and the two Oregon companies which he first took in charge (the Railway and Navigation Company and the Improvement Company) are still earning handsome dividends and are on a sound foundation. The Transcontinental Company, which came later, was caught in the financial gale which began to blow about the time that President Garfield was assassinated, and which has carried down so many promising enterprises since that date. When people began to lose money, suspicion was naturally cast upon Mr. Villard, and as the losses became heavier the storm of detraction became louder and fiercer, until the man against whom its force was directed fell. Then it was found that he had wronged no man or company, that he had helped others as long as he could, and that when he could do no more, he had retired and handed his property over to his creditors as the same might appear. The *Times*, which was conspicuous among his assailants, rightly esteems Mr. Villard's career as a shining contrast to what usually goes on among "magnates" in Wall Street and the railway world.

There seems to be no pressing demand for any specific scheme for distributing the surplus. Already bills have been presented to Congress calling for no less than $500,000,000 of special appropriations for all sorts of purposes. A big surplus is a powerful magnet, and the grand rush made to get some of it will convince Mr. Blaine of the shrewdness of his effort to gain Presidential capital by formulating a plan for general distribution. Already applications have been presented for the appropriation of $105,000,000 for public education, $175,000,000 for pensions, $100,000,000 for the never-ending process of equalizing bounties, $30,000,000 for State claims, $12,000,000 for public buildings, and $25,000,000 for half-pay Revolutionary officers. The pension schemes are unusually prolific and ingenious, and show that the "soldier vote" is still an object of great solicitude.

The publication of the Huntington letters has produced an immediate effect in Washington, by showing some members of Congress how dangerous it is for them to be seen in familiar converse with lobbyists, or the employees of lobbyists. One of them is quoted as saying that the moral of the correspondence is —have nothing to do with Huntington; not because he is a bad man, for Congressmen in the discharge of their duty have to meet bad men, but because he may take advantage of the interview to write a letter to "Friend Colton" about it, giving him the idea that he has secured another vote by corrupt means. There is nothing in the correspondence as published, however, to show that Huntington is in the habit of writing letters for the purpose of blackening the characters of good but unsuspicious Congressmen and Senators, or misrepresenting to Colton what he is about. The evidence contained in them is particularly trustworthy, because he is always so afraid that it will get into print. He had reason enough to desire to corrupt Congressmen, but no reason at all to misrepresent to Colton the real nature of his transactions with them.

The *Sun* has a doleful despatch from Washington, purporting to give the views of Democratic Congressmen who are returning from visits to their constituents during the holiday recess. It represents nearly all of them as standing on the verge of despair. One is put down as saying that "no party can succeed in this country on a free-trade platform during the present generation—it is death to any party now." Another declares that a revision of the tariff without a reduction of the duty on wool is an impossibility, and such a reduction will ruin them in Ohio. Another thinks that Louisiana will never stand a reduction of sugar duties. Another says Mississippi insists upon a duty upon jute; another, that South Carolina must have a duty on rice; and still another, that Alabama must have a duty on iron. "When the Democrats face such facts as these," says the despatch, "they begin to get gloomy, and are determined to do all in their power to prevent an agitation which they fear will lead to ruin." The most curious thing about the whole situation is the idea, which seems to animate the *Sun* in its persistent advocacy of the "gloomy view," that, by taking the back track now and attempting to dodge the issue till after the Presidential election, the party can improve its prospects at all.

The temperance leaders in Ohio have formulated an ambitious scheme for work in the approaching Presidential campaign. They are going to send a petition, signed by Republicans only, to the Republican National Convention, and another, signed by Democrats only, to the Democratic National Convention, asking each body to come out in favor of submitting a prohibitory amendment to the National Constitution. If either convention consents to do this, the support of the temperance vote will be pledged to its Presidential candidates. If neither consents, then a national temperance ticket will be put in the field, and the two political parties must prepare for trouble. The scheme is not likely to alarm the politicians of the country sufficiently to induce them to recognize it. The temperance movement in Ohio and in other Western States, while it is likely to be a formidable factor in State elections for many years to come, must necessarily fall into the background during a Presidential contest, when other and more exciting issues come to the front. Furthermore, the antagonism between the Republicans and temperance people in Ohio during the last campaign threw the State into the hands of the Democrats, and postponed all possibility of temperance legislation till 1885. The situation is practically the same in Iowa. Agitation in either State can hope to accomplish little for two years at least.

The Supreme Court rendered a decision on Monday which will at least suspend or re-

tard the Readjuster swindling in Virginia. The State, it may be remembered, issued bonds, the coupons of which were made receivable for taxes. The Readjusters, when they got into power, proceeded to cheat the bondholders by depriving the coupons of their tax-paying power and forbidding the tax-collector to receive them. A suit was thereupon brought by a taxpayer named Austin Smith, against the Richmond Treasurer, in the United States Court, for levying on his goods for taxes after he had tendered the coupons in payment. The suit was, on the defendant's application, removed to the State Court, where the plaintiff would have no chance. The Supreme Court has now reinstated the cause in the Federal Court. There are other Virginia coupon cases before the Supreme Court, but they will probably not be reached for some time.

The Government seems to make little headway with its attempts to exclude the Louisiana Lottery from the mails. Judge Pardee has just decided a minor point against it, and there promises to be plenty of litigation over the matter for some time to come. The difficulty comes in part from the fact that the lottery is regarded by a large part of the community in Louisiana as an excellent institution, and that there is plenty of money to carry on the fight. In the case of the use of the mail for the circulation of indecent publications, the Government has to contend with timid rascals who are dreadfully afraid of being caught. But in the case of this lottery, one of the moves of the defence has been to get a reputable New Orleans bank to do its correspondence for it. It is difficult to stop such things as this without the introduction of inquisitorial machinery, which is, to say the least, of doubtful utility.

Every newspaper that has referred to Judge McCrary's resignation has urged the increase of the Circuit judges' salaries. The *Herald*, however, makes the somewhat singular remark, that the increase of salaries would not draw to the bench abler men than are now there, and would not keep them there. If this is so, why not leave the matter alone? or why pay them any salary at all? There are plenty of sharp lawyers in this city who would take any Federal judgeship in the land gladly, and pay a bonus for it too. One objection to low salaries is that it occasionally brings on to the bench judges who are altogether too sharp. Has not the *Herald* heard of such cases?

The Raleigh (N. C.) *News and Observer* says that silver now forms the ordinary currency of the South, while in New England there is none of it in use, and in other parts of the North very little. The reason is, that "the large, hard, indestructible silver dollar is well suited to the wants and needs" of the Southern people. It complains, therefore, that the Government, by its present course in coining and putting afloat a silver coin which is only worth 86 cents on the dollar, is doing the South a great injury, and demands that the silver dollar be made within one cent as valuable as the gold dollar by increasing its size. It calls on Mr. Dowd, who serves on the Coinage Committee, to pay heed to this suggestion, which is not novel, though the argument by which it is supported is.

Butler ended his career as Governor of Massachusetts at noon on New Year's Day. He crowded the last few days of his term as full as possible with Butler antics, and was evidently determined to go out of office with flying colors. Having made the mistake of accusing his predecessor of pardoning a convict whom he had himself pardoned, he got out of the blunder, in a thoroughly Butlerish manner, by saying that there were so many Republican officials, and so many Sunday-school teachers, deacons, and ministers in the State prison that he could not help getting them mixed up. Then he appointed to preach the customary election sermon a clergyman who he knew would commend his administration, and rode with great military pomp to the church to listen to it. Then he left a copy of the Bible in the Executive Chamber, inscribing in it that he found no Bible there when he came into office, that he supposed "each Governor took his away with him," that this one had been given to him by a friend, and that he would leave it for the use of his successors.

The latest version of Mr. Blaine's Presidential policy exhibits him as playing the slyest game of his life. He is represented as keeping himself in the background, and pushing forward a multitude of lesser men for the nomination, with the ultimate hope that when each of these discovers that his own chance is hopeless, he will turn about, and out of gratitude nominate Blaine as the candidate upon whom all can unite. In compliance with this deep-laid scheme, it is said that Blaine has already declared himself in favor of five separate candidates. He has nominated Allison in Iowa, Harrison in Indiana, Cullom in Illinois, Miller in California, Sabin in Minnesota, and has given each his private assurance that he is the choice of his heart for the place. In this way he hopes to make them all sharers in the Blaine reserve boom which shall appear at the last moment, snatch the Sage, resisting with all his might, from his "great big table" of historical composition, and thrust him into the Presidential chair. There may be little truth in this version, but there is nothing improbable about it.

Governor Knott, of Kentucky, has been making an attempt, which must prove futile, in his message to the Legislature, to clear the State of the charge of murderous lawlessness. He has nothing to offer in support of his statement except the assertion that homicides are not more numerous in Kentucky than in many other States, and that a "distinguished English journalist," who lately passed through the State, gave it as his opinion —based, in part, doubtless, on the absence of any attempt on his own life— "that human life is just as safe in Kentucky as in England." That it is as safe in slums, saloons, and bar-rooms, we have no doubt; but the charge against Kentucky is that no man is safe among the farmers, lawyers, doctors, and business men against murder or murderous assaults arising out of trifling business or social disputes, which, in other communities, would only lead to coolness or an angry word or two.

In Allendale, S.C., the other day, two O'Bryans were going home from a family dance and were roughly accosted by two Stranges in the street. They resented this proceeding by flogging the Stranges with canes and buggy whips in default of other weapons. The Stranges naturally resisted, and one of the O'Bryans, as a precautionary measure, ran and got his pistol. On his return to the scene of action, he found that the Stranges had received aid from a quarter from which aid seldom comes to men engaged in mortal combat, namely, their grandfather, Mr. Hewlett, the City Marshal, who began to use his pistol freely on the O'Bryans. He was assisted by his two sons, so that there were then three generations of the Hewletts actively engaged. The O'Bryans could not have made head against such odds had they, too, not received a reinforcement in the person of their kinsman, Gus Allen. After a brief action at very close range Tom Hewlett and Evan Strange were slain, and some of the others wounded. The Coroner's jury declared that the dead fell "under pistol shots fired by hands unknown." The Charleston *News and Courier* pronounced this a failure of justice, and asked for an indictment, but the citizens of Allendale have resented this interference at a public meeting, in which they declared that the observations of the *News and Courier* "deeply grated upon the sensibilities of every law-abiding person in Barnwell County," and that "they felt grateful to God for having overshadowed the lives of three brave men while defending themselves from death," while praying to God "to have mercy on the souls of the unfortunate men shriven through the baptism of blood so unavoidable." It thus seems that everybody came out of the affair creditably. The living did some excellent killing, and the dead also are entitled to the thanks of the community for dying.

The Canada protectionists are beginning their education where children begin theirs—in confectionery. A late boom for a protective duty on refined sugar for the benefit of the refiners succeeded so far as to raise the price of American refined sugar to a figure which left a margin for home production. Thereupon a refinery was started which did a good business on the small consumption of the Dominion, but when three more refineries started in competition, the profits ran down so that the protectionists are asking for increase of the duty to save them from ruin. While they are legislating, why not go further, and provide that each family in the Dominion shall consume a definite quantity per annum, and that if the consumers can't pay, the Canadian Government shall? That would be the sweet *reductio ad absurdum* of protectionism, and not more absurd than some of its whims here.

The Higbie-Vaughan mock-marriage case exhibits in a glaring light the condition of the marriage laws of this State. The parties are a boy and girl, of seventeen and eighteen years, and the marriage, according to evidence brought before the Judge, was the result of a "church sociable" frolic. In the midst of this, it was proposed that all present should get married, and a great number of mock marriages were solemnized, the parties in the present case being each married twice over. The testimony taken reveals extreme laxity in the manners of the whole party, but the sum and substance of the case is an attempt on the part of the girl or her family to perpetrate a gross fraud under cover of the law—taking, of course, the Judge's view of the facts proved as correct. The girl, it is true, swore to some facts which gave a different color to the occurrence, but, unfortunately, what she said was contradicted by eight disinterested witnesses. Her lawyer, however, promises to appeal to the General Term of the Supreme Court, and the case may find its way to the Court of Appeals, and become an authority as to the marriage laws of this State. Our judges apparently have to allow such proceedings to be gravely litigated. They show a condition of law which is confessedly scandalous and dangerous. There is nothing to prevent the Legislature from stopping the evil by the passage of a bill requiring record evidence of all marriages. This is all that a marriage license means. Nobody imagines that there is any hardship in such a law. Why should we insist upon record evidence of all transactions of importance involving the transfer of property, and require no permanent record of the most solemn of all human contracts?

A new social craze has been started in England which promises well as far as it has gone —a ghost and haunted-house revival. England, being a country of old families, is full of haunted houses and of ghosts, and the spread of spiritualism in the last twenty-five years has probably done something to create a good atmosphere for a general ghost "racket." It will, perhaps, have a good economical effect in raising the rents of dilapidated houses having a good ghost record. The market for these has always been depressed, but if society takes up the craze with a will, it may possibly bring such dwellings into fashion yet, and this result of the movement would be a godsend to many an old family whose heavily encumbered estates fail to yield the income they once did.

The Irish Government have got themselves into a heap of trouble by having at the outset countenanced the extraordinary doctrine that they ought to prohibit the meetings of the Irish Nationalists in any district in which the Orangemen threatened to make a riotous attack on them. Nationalist meetings held to discuss or petition for a separate government for Ireland are, of course, perfectly legal, because they only discuss or petition for the repeal of an act of Parliament, and they were entitled to be protected by all the force of the state. But Lord Spencer, in a thoughtless moment, gave countenance to the silly view that holding such meetings in Ulster was a reasonable provocation to Protestants, and thus gave the Orangemen to understand that all they had to do, in order to have them prevented, was to threaten to attack them. He has since seen the error of his ways, but too late, for he has to protect them now by charges of cavalry and infantry. How ill-founded the notion is that Ulster is in any sense Protestant territory, in which discontented Catholics or Celts ought not to be allowed to open their lips, is easily shown by the figures of the last census. The Catholics in the ten counties of Ulster number 633,566 ; the Protestant denominations 831,-031. But in five of the ten counties, the Catholics are in a considerable majority, the Protestant strength lying in four counties only. In Tyrone County, in which the recent Orange rioting has been going on, the Catholics number 109,793 ; all the Protestants put together, 87,916.

The story which has been going the rounds of the papers, that the *Tribune's* London correspondent is really an American named Smalley, born and bred in Connecticut, may be dismissed without criticism. The *Anglo-American Times* probably comes near the mark in saying that he is "an officer of the Royal Engineers." But this, too, is doubtful. The officers of the Royal Engineers are generally very accomplished men, of liberal sympathies and opinions. One of Darwin's sons is in the corps. If the correspondent is in the army at all, it must be in the Life Guards, in which none but intensely Tory views of politics and society are tolerated, and an officer's most important duty is commanding the escorts for the Queen between Windsor Castle and the railroad station. He always rides close to the off hind wheel of the carriage, and his chief care is to prevent his men from cantering, which the Queen greatly dislikes. The world seen from this position, and especially the Radical and Irish world, must appear indeed vulgar and turbulent. But against this theory there is the internal evidence of his letters that he is well on in life, in which case he would hardly be serving as a regimental officer. He is, therefore, if a military man, probably a choleric old half-pay general with a wig, who makes it hot for the waiters at the United Service Club and at Boodle's.

The story of the Pope's having received a threatening letter from the Fenians apropos of his course in regard to the share of the Irish clergy in the Nationalist agitation, is an illustration of the absurdly excessive importance which has been attached to threatening letters all through this Irish trouble. The Irish police have kept regular records of the number of such letters received every month, which have been regularly laid before Parliament as important criminal statistics bearing on the condition of the country. As a matter of fact, however, probably not one in a thousand had any importance whatever, or was anything but a cheap and comparatively safe mode of annoying or frightening some one; and the more importance was attached to them by the police, of course, the more of them were written. The Pope's letter is probably of this character. Why should not some wag or crack-brained person, Irish or other, threaten his life by mail, when it only costs five cents, and promises to make a newspaper sensation that will last several days?

The British Cabinet, it was announced on Monday, had settled its Egyptian policy. It has determined to let the False Prophet have the Sudan, but not to let him leave it—that is, to defend Egypt proper against him—and has intimated to the Khedive that to this he must submit, or else go up and fight the Prophet himself. The notion that the Turks or anybody else will be allowed or encouraged to do it has probably no foundation. The Abyssinians can be got to attack him for a trifle, and a little money spent in this way would be well spent by anybody who does not like the Prophet, and wishes him ill. That he will never try to leave the Sudan is all but certain. If he is allowed to have Khartum for a capital, he will be only too happy. It is not likely, however, that he will long remain in undisputed possession of his honor and authority. His success as a Prophet will induce others to go into the business. There are probably a half-dozen dervishes lodging in caves or barrels to-day, and making themselves as nasty and malodorous as possible, in preparation for setting up an opposition concern. There is in the Sudan room for a dozen Prophets to pray, preach, and fight.

Under these circumstances, the course of wisdom both for England and Egypt would seem to be to let El Mahdi have as much Sudan as he cares for. The people all seem friendly to him. Egyptian civilization has taken no hold of them. Everybody seems to welcome him—some few, perhaps, because they believe in him, but by far the greater number because they liked the good old slave-trading days, which under his rule would come back again. Baker Pasha and Chinese Gordon undoubtedly did a great deal to suppress the trade in the Eastern Sudan, but the truth is, whether it be a melancholy truth or not, that the negroes of the South on whom the Arab slave-dealers make their annual raids, will probably not obtain complete immunity within any reasonable period, except by turning Mohammedans. It is an undoubted fact that more has been done for the elevation of the negro tribes of Northern and Central Africa by Mussulman propagandism within the last thirty or forty years than by any other agency. The Mohammedan faith has the inestimable advantage of rousing the savage's self-respect. When he becomes a true believer, he feels himself raised above the infidels around him, and learns to adore and trust in an unseen Power, and for the first time comes in contact with a moral theology, or, in other words, a theology which controls conduct, while he can still remain a fighting man and marauder. What is far more to our present purpose is, however, that he becomes a brother in the eyes of the Mussulman slave-dealers, who will not harm him as long as they can find giaours to prey upon.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, January 2, to TUESDAY, January 8, 1884 inclusive.]

DOMESTIC.

AFFAIRS at Washington have been quiet during the week, owing to theholiday recess. Representative Reagan, of the House Committee on Commerce, hopes soon to consider in that body a bill for the regulation of inter-State commerce. Mr. Randall on Thursday announced the sub-committees of the House Committee on Appropriations.

The House Military Committee has decided to report favorably the bill for the relief of Gen. Fitz-John Porter.

Congress reassembled on Monday. The House of Representatives adopted the rules of the last House, with minor modifications, for twenty days. It having been reported that circulars had been distributed in some of the departments asking contributions for political purposes, in violation of the Civil-Service Law, a resolution was adopted by the House calling upon the heads of the departments for information. The circulars referred to came from Indiana, and requested contributions, for "patriotic reasons," from the Indiana clerks to aid the Republican State Central Committee in preliminary work. The President was requested to furnish the House with information in regard to the exclusion of American hog products from Germany and from France. On Tuesday Mr. Cox, of New York, introduced a resolution calling upon the Secretary of State for information as to the treatment of Jews in Russia. Mr. Dorsheimer introduced a bill relating to the copyright law. Mr. Hunt, of Louisiana, introduced a joint resolution for the immediate appropriation of one million dollars, in accordance with the urgent request of the Mississippi River Commission.

In the Senate on Monday Mr. Gibson, of Louisiana, introduced a bill repealing the act limiting the term of certain Federal officers to four years, and making them removable at the pleasure of the President.

At the meeting on Tuesday of the Senate Committee on Finance, Senator Sherman's bill to authorize national banks to secure circulation up to 90 per cent. of the market value of the bonds deposited, was under discussion, but no conclusions were reached. It was urged in support of the measure that it would enable the banks to use the bonds of long time bearing a rate of interest higher than three per cent. Its passage was objected to on the ground that it would be dangerous to make the amount of the circulating medium the subject in any way of a fluctuating standard It is probable that the bill in some form will be reported by the Committee.

General Anson McCook, Secretary of the Senate, has decided to retain in office all Republican employees who were not disturbed by the Democrats.

The decrease in the public debt of the United States during the month of December was $11,743,337. Since June 30, 1883, the decrease has been $53,049,483.

United States Consul Mason, at Basle, Switzerland, in a report to the State Department, points out that the prohibition of American pork in Europe is really due to the fact that its cheapness injures the prosperity of the European farmers. The theory that American meats are diseased is an invention to still the clamor of the people, who are thus deprived of cheaper meat. He says: "The fact deserves to be widely known that here in Switzerland, which is almost the only Continental country in which American meats are permitted to be imported and sold on their merits, their reputation is not only higher now than ever before, but they command a preference in this market over similar classes of meats from every other country."

A short session of the New York Legislature was held on Wednesday, after which they adjourned until Tuesday evening, in order to allow the Speaker time to prepare his committees.

The Senate and Assembly committees were announced when the Legislature reassembled on Tuesday evening. They were prepared, it is said, in the interests of Republican harmony. In the Assembly, Mr. Littlejohn is Chairman of the Committee of Ways and Means, Mr. Roosevelt, of that on Cities, and Mr. Erwin, of that on Lands.

Gov. Cleveland was called upon, on Weddesday, by a committee of New York city Senators and Assemblymen, who recommended Amos J. Cummings for the position of Aqueduct Commissioner made vacant through the death of Mr. George W. Lane. Mr. Cummings is a journalist. On Monday the Governor appointed Christopher C. Baldwin, a dry-goods merchant of this city, to the vacant position.

Governor Foster, of Ohio, in his message presented on Monday, urges the Legislature to protest against further tariff changes; says that public opinion demands that the Scott law be given a fair trial; opposes the abolition of the prison-contract system, and suggests that all sentences be of an indeterminate character, life sentences excepted, the term of imprisonment to be determined by the prison managers. The managers should adopt a system of rules providing for promotion for good conduct, and reduction of standing for bad conduct. At a certain degree of promotion the convict should be entitled to go out of the prison with the right to his earnings, although he should remain a convict still, bearing the certificate of the prison managers to that effect.

H. B. Payne was nominated for U. S. Senator to succeed Mr. Pendleton, by the Ohio Democratic caucus of the Legislature on Tuesday evening. He received a majority of 7 over all. There were 82 votes cast. Mr. Pendleton received 15, and Durbin Ward 17. It is a victory for the "New Democracy," of which the Cincinnati *Enquirer* is the exponent.

The Women's Christian Temperance Union of Ohio has decided to ask for the resubmission of the Prohibition Amendment at the State election of October, 1885.

The New Jersey Legislature was organized on Tuesday. The Democrats elected Mr. Stoney Speaker of the House, and H. D. Winton, Clerk. The Republicans elected B. A. Vail President of the Senate. In the afternoon Governor Ludlow's message was sent to the Legislature. He recommends an increase in the receipts of the State to $1,000,000 per annum, and a reduction of expenditures by $52,000. He discusses the question of railroad taxation, and recommends a correction of the weak points in the present statute.

The Massachusetts State Senate organized on Wednesday by electing George A. Bruce President, and the House reëlected George A. Marden Speaker. Governor Robinson's first message was sent to the Legislature on Thursday. He favors a constitutional amendment providing for biennial elections and biennial sessions of the Legislature. He discusses briefly the needs of the State civil service, and recommends the enactment of a reform law in accordance with public sentiment. He favors weekly payments of laborers in private or corporate employ, instead of payments at longer intervals.

Insurance Commissioner Tarbox, of Massachusetts, who has had trouble with several insurance companies, presented a special report to the Legislature on Friday afternoon, in which he discussed some of the points at issue. In reference to illegal reinsurance, the Commissioner recommends that a penalty of $500 be imposed on agents as well as on the companies effecting it. As to coöperative insurance, he shows the urgency of appropriate legislation. He says that he has no doubt that many mutual-assessment companies of a fraternal nature exceed their proper powers as such.

A. P. Martin was inaugurated Mayor of Boston on Monday. His message shows that the city will have to borrow $100,000 to meet current expenses during the ensuing year. He urges rigid economy, the consolidation of city pauper institutions, and the creation of a Board of Public Works.

The third annual message of Mayor Low, of Brooklyn, which was sent to the Common Council on Monday, deals especially with the water-supply question. He recommends an immediate enlargement of the Ridgewood reservoir to double its present size, and adds: "In my opinion we ought to take steps at once to secure an increase, not of 5,000,000 or 10,000,000 gallons, as in 1883, but of 20,000,000 gallons, and that as part of a plan having in view an ultimate supply of at least 100,000,000 gallons."

Mr. Matthew Arnold delivered his lecture on Emerson to a large and attentive audience at Association Hall, in this city, on Friday evening. It is asserted that he will probably be the next Secretary of the Education Department of Great Britain, at a salary of $10,000 per year.

Judge McCrary, of the Eighth United States Judicial Circuit, has resigned to become general counsellor of the Atchison, Topeka and Santa Fé Railway Company.

In the lottery cases at New Orleans Judge Pardee has decided technically against the Postmaster-General, holding that the present Postmaster-General cannot revive the original order of General Key after Key had revoked it. He may issue a new order based on evidence of fraud presented to him.

The compositors in the office of the Troy *Times* struck, without warning, on Thursday. The *Times* had been a non-Union office for years, and was paying its men better rates than Union offices in that city. The compositors demanded that it be made a Union office. The proprietors do not propose to yield, and are organizing another force, with every prospect of success.

An order has been given by the anthracite coal managers of Pennsylvania for half time at the mines during January, February, and March. This is received with great dissatisfaction by the workmen.

Nearly all the iron and steel mills of Pittsburgh are now running, with fair prospects of an increase in business during the present winter. The outlook in the iron trade is therefore more encouraging.

The Reading Railroad has notified all of its employees holding public offices to resign their positions or leave the company's employ. Two members of the incoming New Jersey Legislature are affected by the order.

Mr. Henry Villard on Friday resigned the Presidency of the Northern Pacific Railroad, on account of ill-health and for the best interests of the corporation. In his letter he says: "I am consoled by an abiding confidence that the future will completely vindicate all that I have done."

Mr. Villard's resignation as President was accepted, his resignation as Director was laid upon the table. In view of the fact that during his Presidency Mr. Villard had declined to receive any salary, the Directors passed a resolution ordering the Treasurer to pay him a sum of money at the rate of $10,000 a year for the time during which he held the office.

A meeting of influential men was held at San Francisco on Thursday, at which it was resolved to take preliminary steps for a World's Fair to be held in that city in 1887. A guarantee fund of $1,000,000 is to be raised.

The Columbia College Trustees on Monday received a letter from Professor Rees, of the Astronomical Observatory, stating that Lewis

M. Rutherfurd, a Trustee, had given his astronomical instruments to the Observatory. They are valued at $12,000, and consist of a 13-inch equatorial refracting telescope, with other valuable apparatus.

A parlor car containing the members of the Yale College Glee Club, on their annual concert tour, was run into by an express train at Charleston, Ind., on Saturday night, and two students were seriously, if not fatally, injured.

The convent of the Immaculate Conception, of Belleville, Ill., fourteen miles from St. Louis, was burned on Saturday night, and thirty-seven young women and the Mother Superior perished in the flames. The convent was a very fashionable educational institution. The fire started in the basement, cutting off means of escape, and no ladders were at hand long enough to reach the upper stories.

Dr. Edward Lasker, the eminent German Liberal, died suddenly of heart disease on Friday night, between eleven and twelve o'clock. He had been dining at the residence of Jesse W. Seligman, and was walking home with an acquaintance. He suddenly became ill, walked more slowly, and finally sank down upon the door-step of a private stable. He was carried to the coachman's room above and soon expired. On June 22 last, Dr. Lasker came to America to see his brother in Texas, and to make a study of our institutions. He remained in this city for about a month after his arrival, and crossed the Continent with the Northern Pacific Railroad excursionists. Funeral services will be held in this city on Thursday.

A very general cold wave swept over the country during the week, being first felt in the East on Friday. At Jamestown, Dak., the thermometer was 48 degrees below zero on Friday. In this city it stood at 7 degrees above zero on Monday at 6 A. M. There was a general rise in temperature on Tuesday.

FOREIGN.

Affairs in Egypt approached a crisis during the week. It was asserted on Wednesday that if England insisted upon the complete abandonment of the Sudan, the resignation of the Egyptian Ministry would ensue. The Khedive recommended retrenchment in governmental expenses. There was a cry for Ismail Pasha, the ex-Khedive, or English annexation. On Friday it became known that the relations between England and Egypt were strained. The Government of Egypt sent a note to the Government of Great Britain pointing out to the latter that the present state of things in Egypt could not continue, and asking that a final decision should be given upon the Sudan question. If England should refuse the assistance asked by Egypt, the Khedive and his Ministry determined to abandon to Turkey the Eastern Sudan, and reduce the Egyptian tribute to the Porte. The Egyptian troops would then be concentrated in Egypt proper, thus giving a force of fifteen thousand men to protect the frontier, without the aid of the English army.

The British Cabinet on Saturday, after a prolonged discussion, arrived at a final decision as to the Egyptian policy. The policy heretofore outlined by Mr. Gladstone was adopted. Three official despatches are known to have been sent out at the conclusion of the session. The first assured the Khedive that England would maintain her position in Egypt. The second guaranteed the Khedive that England would undertake to resist any attempt at the invasion of Lower Egypt by El Mahdi, but stated that this guarantee meant no more than that England would assume to confine El Mahdi's operations to the Sudan, and must not be construed as promising any assistance in resisting those operations so long as they were not an actual attack on Egypt proper. The third instructed the British Consul at Massowah to inform the King of Abyssinia that England would not approve of any military operations by Abyssinian troops in the Sudan. Great Britain does not object to the cession of the Eastern Sudan to Turkey, or to Turkish reconquest of the Sudan, provided the Porte pays the expenses. England insists upon the withdrawal of the troops at Khartum to the second cataract of the Nile.

The Egyptian Ministry tendered their resignations to the Khedive at 8 o'clock on Monday evening with the following letter: "The Queen's Government has demanded the abandonment of the Sudan. We have no right to take that step, since the Sudan is in the possession of the Porte, and intrusted to our charge. The Queen's Government asserts that Egypt should follow its counsels without discussion. This declaration violates the organic rescript of August 28, 1878, that the Khedive governs with and through his Ministers. We resign because we are prevented from governing in accordance with the Constitution." On Tuesday Nubar Pasha, who was the Egyptian Minister of War in 1878, accepted the Premiership of the new Ministry, and appointed Mr. Edgar Vincent Minister of Finance.

France regrets the attitude of the English Cabinet on Egyptian affairs in refusing to act outside of Egypt proper, but will offer no objections thereto.

A meeting of the British Cabinet was held on Thursday, at which the programme to be adopted by the Government at the coming session of Parliament, to begin on February 5, was considered.

Earl Spencer, Lord Lieutenant of Ireland, after attending a Cabinet Council in London, returned to Ireland on Saturday with the sanction of the Cabinet for the adoption of such measures in Ireland as he may think necessary to preserve order.

A friend of O'Donnell has published a story in Dublin to the effect that the latter narrated to him the circumstances attending the assassination of Carey, the informer, and that the affair was a deliberate murder, for the sake of revenge, on the part of O'Donnell.

Mr. Henry George arrived in London on Sunday, and was received by 1,500 people at the railway station, among them a committee of the Land Reform Union.

The striking weavers in North and North-east Lancashire, England, have increased in numbers to 18,000.

A new book has been written by Queen Victoria entitled: 'More Leaves from the Journal of Life in the Highlands, from 1862 to 1882.' Copies have already been presented to a few privileged persons.

William Black, the English novelist, is seriously ill from over-work.

Mr. Lowell's resignation of the Lord Rectorship of St. Andrew's University was on Wednesday positively announced. The principal of the University has requested him to deliver an address to the students and he has consented.

The French Government has received no official communication from the Marquis Tseng, the Chinese Ambassador, since the capture of Sontay. It is asserted that Admiral Courbet met with such stubborn opposition from the enemy, in his attack on Sontay, that he has decided to await the arrival of reinforcements before making any further movements.

The report that the Black Flags massacred French prisoners, captured before Sontay, has been confirmed.

A Paris correspondent asserts that the French Government proposes to sell the state railways; moreover, that the Rothschilds, in behalf of certain great railway companies, have offered the Government 420,000,000 francs for the lines. If the sale were effected, the Government would be enabled to dispense with its contemplated loan of 400,000,000 francs. But the rumor is explicitly contradicted.

Marquis de Rays, charged with falsely inducing many persons to subscribe to an alleged enterprise for the colonization of Port Breton Island, in the South Seas, and for inducing several hundred people to settle there, where many of them died of starvation, was on Wednesday convicted in Paris, and sentenced to four years' imprisonment and $600 fine. A number of his associates were also convicted and sentenced.

A Rome correspondent asserts that the conversation held by the Pope with Crown Prince Frederick William upon the occasion of the latter's visit to the Vatican, consisted of two parts, one of which will remain absolutely secret, while the other will be published at the proper time. The Pope has informed the Cardinals that he has consigned to the secret archives a detailed account of the conversation between himself and Prince Frederick William, in order to transmit to posterity a statement which may in the future be of much importance.

It was reported on Friday that the Pope's Secretary, Monsignor Boccali, opened a letter from America, addressed to "Leo XIII.," containing Fenian threats against the Pope should he continue to support England against the national cause in Ireland.

The Pope has confirmed the appointment of Archbishop Gibbons, of Baltimore, as apostolic delegate to preside at the Catholic Council to be held in Baltimore in 1885.

The ceremony of transferring the body of the late King Victor Emanuel from its temporary burying-place to the chapel in the Pantheon, took place in Rome on Saturday. The public was not admitted.

Marietta Gazzaniga, the well-known opera singer, died recently in Italy. She was about sixty years of age.

Prince Bismarck has forbidden the circulation in Germany of three well-known organs of extreme Socialism.

The latest version of the recent accident to the Czar is, that while he was returning from a hunting expedition with his suite, six men suddenly appeared in the road and shot at him. His horses became frightened and his sledge was overturned. A bullet lodged in his shoulder, but the wound is not dangerous. Whether the story is true or not, the revival of Nihilism is undoubted.

Four Nihilists committed the murder of Lieutenant-Colonel Sudeikin, referred to last week. The leader was an ex-artillery officer, who was discovered to be identical with Jabowski, the Nihilist. Important papers relating to Nihilist plots have been found at the late residence of Sudeikin. Thirty arrests have resulted.

It is reported by the correspondent of a London newspaper, that the passage in President Arthur's message wherein it is stated that it might become necessary for the United States to coöperate with other Powers for a safeguard of their rights of trade on the Congo, has given grievous offence to the Portuguese Government, which is under the impression that the Washington Cabinet would take a different view of the matter if Portugal had at her disposal a large fleet like that of England.

The Government of the Dutch East Indies has sent a body of troops to the West Coast of Atcheen, to compel the Rajah, who holds in captivity the crew of the steamer *Nisero*, which was wrecked there in November last on the passage from Surabaya to Singapore, to surrender them.

Twenty-seven men employed at the Bolt works near Toronto were killed while on board a train near that city, on Wednesday morning. Their train was run into by a freight train. Many injured have since died.

Keshub Chunder Sen, the philanthropist and the promoter of the Brahmo Somaj sect in India, is dead.

JUDGES AND RAILROADS.

JUDGE MCCRARY, of the Eighth U. S. Circuit, has resigned, and has made a frank statement of his reasons for doing so. He resigns because the Atchison, Topeka and Santa Fé Railroad has offered him a much better salary than the sum ($6,000) which the United States gave him. He says that he cannot, in justice to the claims of his family, decline an offer of honorable professional service, which will greatly increase his income and at the same time lighten his burdens. In making this statement he follows the example of Judge Dillon, who resigned this same judgeship four years ago to take a similar position as the salaried counsel of a great railroad.

These facts constitute an instructive commentary upon our judicial salary system. There are nine judicial circuits in the United States. The judges have the same jurisdiction, authority, and responsibility that attaches to the judges of the Supreme Court at Washington. The office of resident circuit judge was created after the war, to relieve the Court at Washington. A judge of that Court on circuit is, or ought to be, drawn from the same class as the judges at Washington. Nevertheless the United States pays the judges at Washington $10,000 a year, the Chief Justice getting $500 more, and the resident circuit judges $6,000, and this although many of them, if not all, have to live during most, or a considerable part, of the year in cities where the rate of living is high, such as New York, Boston, San Francisco, and Chicago.

Now, in these circuits, since the war, the growth of litigated business has been enormous, especially so in the case of railroads. These corporations, for example in such a circuit as that from which Judge McCrary has just resigned, embracing the great railroad States of Iowa, Kansas, Minnesota, and Nebraska, are continually before the United States judges. Sometimes it is a foreclosure of which they arrange the terms; sometimes it is a receivership, when they not only appoint the receiver, but, through his agency, may have to run the railroad for months, clearing off its debts, enforcing its contracts, deciding whom it shall and whom it shall not employ. In all this business, the parties before the Court are great corporations, owning miles of territory, retaining the most expert lawyers the bar produces, and paying them enormous fees or large salaries. The legal battles fought out in these courts are the battles of giants; they affect millions of property, and the railroads have found by experience that they must in such litigation secure the very best legal ability the country affords without regard to its cost. From ten to twenty thousand dollars a year is the price of service of this sort for the great corporations.

It is into this market that the United States comes to look for circuit judges. Against the bidding of the railroads all it has to offer is the honor of the position, a tenure no better than that offered by the railroads, a life of more constant toil, and a much lower salary. One of two things must happen in consequence. Either the United States will get a second-rate lawyer, who will not do his work well, or, what is more likely, it will get a man of ability, but of small practice, to whom the position will count for a good deal. In a few years he will, as has happened in the case of Judge Dillon and Judge McCrary, become familiar with the business of his court, and become, moreover, an expert in railroad and corporation law; in other words, he will have entered the field from which the great corporations draw their lawyers. It will become worth the while of some railroad to offer him such a salary as will tempt him to give it the benefit of his ability and judicial experience. To suppose that under such circumstances he will remain on the bench is absurd, and nobody does really suppose it.

The present system of lean salaries, therefore, tends to make the United States courts not great professional prizes, to which the greatest lawyers constantly look forward, but preparatory schools for the training of corporation lawyers. The type of an "ex-Judge" who has actually risen from the bench to the position of counsel to a railroad is a peculiar feature of our times. It is hardly necessary to say that it is not for the interest of any country to have such a view of the judicial career gain ground; and the only way to check it is to give the judges such salaries as to make the salary and the position combined more tempting than the bids continually made by the great competitors of the United States in the professional market. A railroad corporation that tried to get its legal work done on such terms as are offered by the United States, would speedily get into terrible trouble.

WHY THE CITY GOVERNMENT IS BAD.

THERE is another and unusually serious attempt to be made to reform the New York city government at this session of the Legislature, in the final passage of a Constitutional Amendment introduced two years ago by a Democratic Assemblyman from this city, Mr. W. S. Andrews. It prohibits special legislation with regard to any city, or any provision for the filling of any office now existing, or hereafter to be created, otherwise than by popular election, or by the appointment of the Mayor, and remits the organization of every municipal government to the people of the place, subject only to such general laws as the Legislature may pass. If the amendment be approved by the present Legislature, it will be submitted to the people next fall. But the amendment submitted by the Tilden Municipal Commission got as far as this one, and was killed. This one has perhaps a somewhat better chance of success, because it has at its back seven years' more experience of municipal corruption and misgovernment.

If it fails, it will fail for the reason which has for twenty-five years prevented any real improvement in municipal administration, and that is, the fact that, as a general rule, the State is Republican while the city is Democratic. Through their possession of the Legislature, therefore, in seven years out of ten, the Republican managers are furnished with the materials for "dickers" and "deals" with the Democratic politicians of the city. The latter have great popular majorities at their disposal here, but they cannot turn them to full account as long as the Republicans at Albany have, through the Legislature, a firm hold on the city charter. This enables the latter to extort a fair share of city patronage from those who, under the spoils system, are its lawful owners.

There is no doubt, too, that the way in which the majority in the city supports Kelly, and for a good while supported Tweed, furnishes the Republicans with a very plausible argument against committing the vast body of property and mighty commercial interests now concentrated in New York to the complete control of the local vote. The same argument tells, as far as it goes, against permitting the election by a popular vote of an autocratic Mayor. Unless, however, the principle which forms the very foundation both of the State and Federal Government is defective, the majority is as fit to rule a city as to rule a nation; but this principle assumes that the majority is a majority of taxpayers. It is not noses which are supposed to be counted when a popular vote is canvassed in any part of the United States, but men who pay money for the common welfare and defence, and know they pay it—for a taxpayer who pays without knowing it, is for political purposes no taxpayer at all. In this matter more than in most others, the old Schoolmen's rule holds good, that what is not seen is of no more account than what does not exist.

Now, the reason why majority government succeeds so well all over the country in small municipalities, like towns, and does not succeed in large cities, is that in the former all, or nearly all, voters are direct taxpayers, and thus feel local politics to be part and parcel of their private and personal affairs. The tax-collector comes to nearly every householder to ask for a sum, be it small or great, the amount of which is in some way dependent on the last election or last town-meeting. In the great cities, on the other hand, the majority is largely made up of persons who, although really taxpayers, and suffering in health and comfort and income from municipal extravagance and corruption, do not believe or realize that they pay any taxes at all. They think the rich pay them, and it is because they think so that bosses like Tweed and Kelly are able to wield them at their will. We believe that any change in the municipal government which sent the tax-collector to every man for any sum, however small, the amount of which clearly depended on the city expenditure, would do more for good government in New York than any other single device. The payment by every man, however humble his abode, of the poor-rates as a condition of voting is the salvation of municipal government in England. It gives every laborer an active and intelligent interest in municipal affairs, although he is in no English municipality nearly as much of a taxpayer as the thousands of laborers here, who year after year send a gang of liquor-dealers to the City Hall to swindle and betray them. The "bottom fact" of misgovernment in this city, in short, is the belief of the poor that whatever their leaders can filch out of the Treasury and

spend in politics comes out of rich men's pockets and not out of their own. It was this lamentable delusion which the Tilden Municipal Commission sought to dispel by creating a Board of Finance, to be elected by people paying twelve dollars a month rent.

But even as things now are, we believe, if there could be a fair trial of strength once in two or three years between the intelligent and industrious voters of the city and the ignorant and idle or corrupt, on a distinct and important issue, the victory would remain with the former every time. If the Mayor were an all-powerful officer, and his election took place in the spring, with no other candidates to distract public attention, or confuse the public mind, so that the vice and virtue of the community could be fairly brought into collision over him, we believe the latter would invariably triumph. The very worst offence which the State government commits against the people of this city, and has been committing for nearly forty years, is the maintenance of charters which prevent this trial of strength from ever taking place, which provide so many offices and so many candidates, and so diffuse responsibility as to make the city government a huge mystery, which nobody can understand but the men who make a living out of it, and the effect on which of any election not even the innermost intriguers of local politics can foresee.

A NEW COPYRIGHT SCHEME.

ACCORDING to a Washington despatch, Mr. Dorsheimer, of this city, has introduced an international-copyright bill in the House, designed to afford protection to foreign authors here and to American authors abroad. It provides that whenever any foreign government shall accord to American authors the same rights that their own have, then, by Executive proclamation, the foreign author shall have the benefit of our laws. This is substantially the existing English system, and the passage of the act would at once establish international copyright between the United States and Great Britain.

A good many very enlightened publishers have always been of opinion that such a measure as this should receive the support, not merely of authors, but of all American publishers who are in favor of international copyright at all. What publishers desire is protection for American book manufacturers. This, in a country in which all domestic industries are protected, is natural enough; but the machinery for accomplishing this object is the tariff. Congress has always shown a perfect willingness to yield to their demands with regard to foreign books, and the rate of duty can be fixed so high, if it is not high enough already, as to prevent their competing with home-made books. The foreign author would then, in order to reach the American market, have to rely on an American reprint. In other branches of trade we do not mix up questions of property with the question of protection. We do not, for instance, say to the foreign wool-grower, "Grow your wool here, or else we will take your wool wherever we find it and use it. We need cheap clothes, and therefore we cannot possibly recognize property in foreign wool." In the same way, though we undoubtedly use cheap spades and shovels, we do not say to the foreign maker of these articles, "Come over here and help us develop our iron industry, or else we will take your spades and shovels wherever we find them." But in copyright the publisher who admits that the foreigner's property in books ought to be recognized, and immediately turns upon him and says, "We will not recognize it, however, unless you consent to employ us," takes an unfair advantage of the accident that internationally there is no protection for this kind of property which each country protects in every other way. The recognition of property in books is a simple matter of justice and right, and even the extreme protectionist view does not require us to encourage a system of wholesale pillage for the purpose of opening foreigners' eyes to the advantage they could derive from turning to and helping our American manufacturer make money.

Mr. Dorsheimer's bill, however, has another feature of a novel sort, which is very objectionable. This is a provision that copyright shall only last for twenty-five years, and not be renewable. The subject of the proper duration of copyright was inquired into in England only five years ago by a very competent body of commissioners, and the evidence taken showed conclusively that to do equal justice to all classes of literary compositions a long term is necessary. Some books, such as novels by well-known hands, become immediately valuable, and in process of time their value disappears through a change in the public taste. Others require a considerable period to attain a market. Wordsworth, in 1845, told Mr. Macmillan, the publisher, that he had but just begun to receive any considerable sums of money from the sale of his poems. He was then an old man, and received about $1,500 a year. In 1876, it appears that his copyrights would have been worth $5,000 a year. Unfortunately, however, the copyrights had run out, so that the larger part of the results of his life of labor and self-denial were totally lost to him. Herbert Spencer published for years at a loss. It took him twenty-four years to reach a point at which his writings were not a positive pecuniary injury to him. Professor Huxley testified before the commission that this was the case with many valuable works relating to physical science, and all lawyers know how true it is of law books of any merit. The only way to put authors on an equal footing is to make the duration of copyright a long one. So universally has this principle been recognized by all modern civilized states that the period for the last hundred and fifty years has been steadily growing. In England and in the United States it has been extended from fourteen to forty-two years, in some European countries the time is even longer, and the tendency of all the evidence taken by the late commission in England was to show that it ought to be lengthened, not diminished.

It is difficult to see any reason for accompanying an international-copyright act by a provision shortening the duration of the protection. Such curtailment will not be likely to please either the domestic or the foreign author. No publisher who is in favor of international copyright has ever asked for anything of the kind, so far as we know, and even the pirates could not profit by it in the case of any book until so long a period after it came out that their business would hardly be benefited appreciably by the restriction.

WASHINGTON ETIQUETTE.

THERE is, it seems, and not for the first time either, some trouble in Washington among the ladies of the Cabinet over the place given to Mrs. Carlisle, the Speaker's wife, at the White House reception on New Year's Day. She received standing next to the President, while it is maintained that the wife of the Secretary of State should have occupied this position, and that Mrs. Carlisle should have stood "below" the Cabinet. Another question which has come up again this winter is that of the relative social rank of the Speaker's wife and that of the wives of Supreme Court judges. One has a close connection with the other, as may be easily shown. The lady who receives with the President is the "first lady in the land." In ordinary cases it is his wife; when he is unmarried, or a widower, any one temporarily taking this position is first lady for the time. But the first lady must obviously outrank the wives even of Supreme Court judges. Therefore, if the Speaker's wife is really first lady, the judges' wives and the wives of Cabinet officers ought to call upon her first. But it is said that Mrs. Carlisle has, notwithstanding her place above the Cabinet on New Year's Day, determined to call first on the judges' wives—a resolution which leaves her rank in the sort of limbo in which we believe it has been for many years.

At a distance from Washington all this sounds rather perplexing, for it seems odd that there should be enough etiquette to furnish problems like these in the capital of a country in which, speaking generally, formality in manners is so little practised. We never meet with discussions in the press as to who is the first lady of New York, or of Milwaukee, or of Chicago, and no one in this city would bother himself much as to what was the social rank of a judge's or ex-judge's wife, as such. This is mainly because the divorce between Society and politics or official life here is complete; but the same thing is true of Boston, where the separation has not gone so far. Who is the official "first lady" of these places? The eye of man, or, what is of more importance, of woman, has not seen any such person.

But in Washington, to a considerable extent, etiquette and precedence do really present "live" social questions. The right (derived from official position) to go in to dinner before another, the right to sit in a particular seat, or in a certain proximity to a certain seat, to stand "above" or "below" a fellow-creature, to be visited first, are really valuable rights, which are much thought about, discussed, and even quarrelled over. A theory even

of Washington etiquette has been evolved on the spot, and a very respectable theory too, based, like the Constitution, upon the Federal connection of sovereign States. There is on the one side the Federal Union, which represents the delegated powers of sovereign States. On the other hand are the States themselves, of which the Federal Government is itself the creature. Here we have two great fountains of social rank and honor, which must come before everything else. Consequently we have at the head of this social hierarchy the President and the "first lady," and then the Cabinet, Senators, and Supreme Court judges. Congressmen, who represent neither a State nor the whole country, but merely a "district," clearly come last, and in fact there are not many Congressmen or Congressmen's wives who go much into "society" in Washington. They are not troubled by their low rank in the theoretic scale so much as by their low salaries and unfamiliarity with "society" at home, for, in the "district," society is usually the luxury of the rich.

The theory, however, is not perfect when we come to details, for it has the same inherent defects which the theory of our political institutions has. That is, when the States and the Federal Government come into collision, who is to decide between them? In the old States-rights times, of course, the social expert was inclined to take the view that the Senator's wife was a more important person than the Supreme Court judge's wife; but the political view of which this was a social corollary having been entirely exploded by a bloody war, which convulsed the country for four years, and cost millions of money and lives, the derived social theory has suffered a serious loss of popularity, and the rank of social representatives of States is not what it was before the cataclysm produced in Washington society by the fall of Sumter.

Washington etiquette has its real and at the same time its amusing side. It is made vastly more real than it would otherwise be by the presence of the foreign diplomatic body, who come from countries where these subjects are a matter not merely of study and speculation, but of breeding. They are born in an atmosphere in which etiquette naturally thrives, that is, in which there is a permanent official class the social relations of whose members make up a large part of daily existence. They bring with them to Washington an interest in matters of this sort which is an important contribution to its life. Besides this, Washington is the only place of any size in the United States in which society is in the hands of an official class, and it is a moral certainty that, when this is the case, the women will devote a good part of their time to settling such questions as seems to have arisen as to the Speaker's wife, but which are, we believe, very often in this country not permanently soluble. For most European countries have one great advantage over us in this matter—that the positions about which any controversy may arise are permanent. A king or queen, for instance, is always a king or queen; an archbishop is always an archbishop. But a "first lady in the land" who holds the position temporarily, or by a sort of *ad interim* appointment, is a social solecism. As she must hold this or any other rank in the social hierarchy in Washington by virtue of her position in the family of some office-holder, the rank has to come to an end when his official life terminates. She would then become ex-first lady; but the women have never shown any inclination to tolerate any such rank, in the way that men do among themselves. There would, in fact, be a certain absurdity in saying of any one that she was the first lady of the land last year, or has a chance of becoming first lady if her husband's still-hunt for the Presidency succeeds. The termination of official life at Washington remits the whole family to the social position they occupied before, and the contrast between the two is sometimes very great. These facts have the effect of introducing a spirit of Christian charity into Washington society, and lead those who carry it on and understand it best not to bear too hard upon points at issue, however grave in themselves.

EDWARD LASKER.

THOSE who made Dr. Lasker's acquaintance after his arrival in the United States last summer must have been struck with the singular contrast between his appearance and his reputation. They saw a man of diminutive stature, of feeble, almost inaudible voice, of diffident, shrinking manner; and they may have found it difficult to believe that this was the bold parliamentary leader who had stood in the front of important political movements, the orator whose trenchant and lucid eloquence had won the enthusiastic applause of a great people and defied the most powerful minister of our time, and the profound jurist and large-minded statesman who had shaped the laws of a great empire. But what was seen here of Lasker was merely the wreck of his former self. The overwork and the anxieties of his public life had ruined his physical and mental constitution, and he had come here only to seek rest and health. There seemed, indeed, to be signs of recovery, and now and then the wealth of his information and the acuteness of his mind would show forth in quiet conversation, or in an occasional striking remark in a public address. But while he had a lingering hope of being able to resume his duties in a short time, the thought that his career might soon be ended not unfrequently came to him as well as to his friends.

In Lasker the German people have lost one of their truest and purest as well as most useful servants. His public spirit was first stirred by the revolutionary upheavals in 1848, when he was but a youth of nineteen. But for thirteen years afterward he devoted himself to a thorough preparation for legal practice, upon which, however, he never entered. He first attracted attention between 1861 and 1864, through some essays on constitutional law and public administration, and in 1865 he was elected to a seat in the Prussian Landtag. A year later came the war with Austria and the North German Confederation. Bismarck, who had until then been looked upon as the very embodiment of absolutism, suddenly became the embodiment of the national idea and the idol of the people. To complete the work of German unity, he needed popular support, and to that end he leaned upon the Liberals. The "National-Liberal" party was formed, and Lasker became at once one of its foremost leaders. To the great work of national organization which then began, he brought the warmest zeal, an indefatigable industry, and all the resources of his vast legal knowledge and sagacity. Nobody equalled him in the discussion of constitutional and kindred questions. Every branch of the legislation of that period bears the stamp of his mind. The *entente cordiale* between him and Bismarck became proverbial. But it was not destined to last.

After the French war of 1870–'71, and the establishment of the German Empire, Bismarck regarded his alliance with the liberal sentiment of the country as no longer a necessity. His aim was now to secure to the monarchy the greatest possible power within, and in the pursuit of this object the autocratic tendencies of his nature came sharply into play. Men like Lasker, on the other hand, while always ready to support him in every measure necessary to strengthen national unity, demanded a government constitutional in spirit as well as in form. He sustained Bismarck in the "Kulturkampf," in his foreign policy, and even in his measures against the Socialists. But he insisted upon constitutional government, and vigorously opposed the Chancellor's economic schemes, especially his sudden turn in favor of protection. And when the National-Liberals went further in the way of accommodation and compromise with Bismarck's new plans than he thought compatible with his principles, he "seceded" from his party and joined the Parliamentary group standing between the National-Liberals and the Progressists. No sooner was the *entente cordiale* dissolved than Bismarck pursued him with that ruthless bitterness which he feels toward those who followed him once and will follow him no longer. But all the Chancellor's invectives and sarcasms could not suppress him. Lasker achieved, perhaps, his greatest popularity when he, with singular power and fearlessness, attacked, in the persons of high officers of the Government and members of the nobility, that spirit of corruption and swindling speculation which, after the French war, swept over Germany.

However, the contest was unequal. Bismarck, entrenched in power and at all times able to point to the immense services he had rendered to his country, proved in a certain sense an invulnerable antagonist, while the Opposition was disunited and irresolute. Lasker, who had a strong sentimental touch in his character, suffered in his heart from a warfare which he would have been too happy to avoid. And then came over him, as well as over many of the old Liberals, that feeling of lassitude and despondency to which those engaged in an apparently hopeless contest not unfrequently succumb. He saw that as long as the old Emperor and Bismarck lived, Germany would remain in a state of torpid expectancy, and that no effort could materially improve the situation until a change of persons in the highest places should occur in the

natural course of things. That change he did not live to see.

Lasker will be remembered in Germany not only as a brilliant orator and a wise legislator, but as a man of unspotted purity of life, of the warmest patriotism, and of that unquestionable disinterestedness of motive which makes a public character especially dear to the popular heart. He was a Jew, and his death is not unlikely to excite in Germany a fresh feeling of disgust and shame at those anti-Semitic scandals which caused the keenest sorrow to this eminent citizen during the last years of his life.

THE SOCIAL MOVEMENT IN ENGLAND.

LONDON, December 20.

READERS of the *Nation* who are interested in English affairs must have noticed the agitation which has sprung up (with apparent suddenness) about the dwellings of the poor. Will you allow me to make one or two observations upon a phase of English feeling or opinion which is remarkable in itself, and is still more noteworthy as a sign or part of a general social movement?

First. The agitation about housing the poor arises not from suffering, but from sympathy with suffering. The movement has derived support from the most different sides. Statesmanship is represented by Mr. Bright, by Lord Salisbury, and (odd though the juxtaposition sounds) by Mr. Chamberlain. English philanthropy speaks appropriately through the Earl of Shaftesbury and Miss Octavia Hill. The experience, the humanity, and, I must add, the rhetorical inaccuracy of the clergy, find utterance in the appeals of the Rev. Brooke Lambert, the Rev. A. Mearns, and the Rev. Stopford Brooke, while the imaginative sympathy of literary men expresses itself in Mr. Sims's pictures of "Horrible London," and in the articles of the *Pall Mall Gazette*, which breathe the noble humanity and the enthusiastic inexperience of youthful democrats One may indeed fairly say that the sufferings of the poor have enlisted the sympathy of every class but one. One class alone has given no sign: the poor, whose "Bitter Cry" is conventionally supposed to have aroused the rich from a state of sleepy inattention, have scarcely uttered a word. Costermongers or paupers cannot, it may be suggested, write to the *Times* or the *Nineteenth Century*. This is partially true (though I am not quite certain that Mr. Knowles would not pay a handsome price for an ill-spelled letter from a genuine costermonger); but it is not the whole truth. The poor in England, as in every free country, find methods of making known their misery or discontent. When Mr. Lowe attempted to tax lucifer matches, he found that a class whose existence was unknown to most M. P's. could proclaim with more than sufficient emphasis their (probably ill-founded) objection to a new impost. If the mass of London poor had experienced any new or (what is practically the same thing) any acute grievance, they would have made their bitter cry audible from their own mouths. That excellent philanthropist, Mr. Brooke Lambert, would perhaps do well to note that "Esau's Cry" was raised by Esau and not by a sympathetic bystander. The silence of the poor, contrasted with the vehement complaints of their friends, is a fact of unspeakable importance.

Nothing, let me assure your readers, is further from my intention than to say or to hint that London does not abound in dwellings—if dwellings they can be called—utterly unfit for the habitation of civilized human beings. It is unfortunately but too easy to believe Professor Huxley's assertion, that in England many men and women lead lives more wretched than the lives of savages. On the existence of such wretchedness, the fact to which I have called attention, namely, the silence of the poor themselves, throws no doubt. But the fact has, nevertheless, a twofold significance. It attests in the first place the immense influence in modern society of sympathetic emotion. Christianity and civilization have, after the lapse of long years, produced an effect on human character of which politicians and economists have not taken sufficient account. All the influences which we sum up under the name of peaceful progress have, in countries such as England, produced a state of sentiment under which large bodies of men feel so keenly the obvious and the palpable pains of others, as to be at once impelled to make every effort, reasonable, or unreasonable, to get such pains alleviated or removed. Of the thousands who have read Mr. Sims's pictures of "Horrible London," we may feel sure that the vast majority felt at once that the mere knowledge of such horrors was so painful that they "ought" to be removed. The existence, however, of this general indignation and suffering makes it necessary to modify the received theory of revolutionary changes—namely, that they arise from the passion and effort of classes who can no longer bear the burden of grievances which are becoming intolerable. This theory, which may have squared with the facts of early civilization, applies, as we now see, very imperfectly to modern society. Social convulsions may arise quite as often from indignation at suffering as from suffering itself. Slavery was abolished, not by men who feared to be sold or flogged, but by men who could not bear to think that other persons should be exposed to sale and torture; and slavery might have existed to this day in Jamaica and in South Carolina had its abolition depended upon the energy or the indignation of the slaves. In the England of the nineteenth century innovation is quite as likely to arise from the sympathy of the rich as from the grievances or from the political power of the poor. Revolution may come from above just as well as from below.

That the "Bitter Cry," again, of which we have heard so much, does not come from the poor themselves, does raise the important practical question whether it is the sufferings of the poor, or the knowledge of these sufferings by the rich, which is new. The topic is one on which any impartial man would be slow to pronounce a confident opinion. When, however, assertions are made which imply that the accumulation of wealth has in England been unaccompanied by its due diffusion, there is nothing unreasonable in asking for distinct proof that allegations, on the face of them improbable, are actually true. Some of the best judges seem greatly to doubt whether the idea that the position of the poor is deteriorating is more than a delusion. Mr. Bright is assuredly not indifferent to the physical condition of the laboring classes, yet the day's papers contain the expression by him of the opinion, which he has often enough before avowed, that "the physical condition, the health, the intelligence, the comfort of the homes, and the general contentment throughout the whole of the country, vastly surpass that which prevailed forty or fifty years ago." He almost in effect repeats the dictum attributed to Macaulay: "For fifty years I have heard of nothing but decay and I have seen nothing but progress"; and Mr. Bright is, be it noted, the statesman who, not a year ago, forced the condition of dwellings for the poor on the notice of the nation. He may perhaps, however, be termed an optimist. Let us take, then, the judgment of one whose views of philanthropy are not derived from the school of Mr. Bright. Lord Shaftesbury makes the present crisis an opportunity for referring to the address by Mr. Giffen on the "Progress of the Working Classes." He "ventures to express a hearty concurrence with the statements of that admirable paper," and adds the pregnant remark: "The enormous capital now held by the coöperative associations (a fact which Mr. Giffen appears to have omitted), is a most striking and satisfactory proof of what can be achieved by the energies of active, intelligent, self-relying, and thrifty men"

The thoughts suggested by Mr. Bright and Lord Shaftesbury must weigh heavily with every candid critic of the movement which I am criticising, but they will hardly at the present moment exert much influence over English opinion. The immediate excitement of the public is grounded on emotion. A gust of feeling has passed over the face of English society. The surface, at least, is moved; no one can tell for certain how far the depths of English feeling are touched. The emotional nature of the agitation for housing the poor is apparent in more ways than one. The "Bitter Cry," "Horrible London," "Esau's Cry," and the like, are themselves cries, not arguments. They are intended to be the war cries of a crusade against misery. They betray the fact that the new crusaders, like the old, hardly know the way to their journey's end, or understand the difficulties and perils which they are destined to meet on their march. A curious proof of this is that those who appeal to the public for legislative or other interference on behalf of the poor, constantly confuse under one term—"the poor"—two totally different classes, the artisans, namely, of our great towns, and persons who, from their own fault or otherwise, have sunk to a condition little if at all better than that of paupers. To lump together workmen and outcasts under the misguiding name, "the poor," can lead to nothing but confusion of thought and consequent mistakes of action. Yet it is, I think, palpable to any one who even glances through the letters and articles which have excited the feelings of the public, that the force of many appeals to sentiment lies in arguments which imply that pictures of the outcast poor, or (to use Mr. Bright's term) "the residuum," have some application to the whole body of the artisans or laborers who crowd our cities. There are other signs that sentiment or emotion has for the moment made many of the public incapable of seeing plain facts as they are. Mr. Brooke Lambert's "Esau's Cry" is in the main a very sensible and temperate article, of which the merits are likely to be concealed under an inappropriate and not very sensible title. But even a man so full of good sense as Mr. Lambert hazards the assertion that, "in 1866-68, the Fenian outbreak seemed not unlikely to have its counterpart in an English uprising." We are here upon the ground not of speculation but of history, and one may confidently say that the threatened English uprising of 1868 was unknown to almost every Englishman who lived through the not very exciting crisis of the Conservative Reform Bill. The breaking down of the Park railings can hardly be regarded as a serious menace of civil war by any one who looks back upon past events with the calmness of an historical critic. Mr. Brooke Lambert's view is, we suspect, distorted by the feeling of the moment. That a man who is himself writing with a view to correct exaggeration should himself be so biassed by the feeling of the day, is a striking proof how great is the strength of that feeling.

Secondly. The agitation about housing the poor is merely a part and sign of a general social

movement. The immediate burst of feeling which has forced the condition of the outcast poor upon the attention of the public is sudden, and may be transitory or superficial. But this momentary indignation at the miseries of the lowest class of the population is, after all, merely the latest expression of two sentiments or convictions, which (whether well founded or not) have gradually impressed themselves upon large bodies of Englishmen. The first of these is, that the mass of the people ought to share far more fully than they do, not only in the material benefits, but also in the enjoyments, of civilization. The second is, that the power of the state affords a proper instrument whereby to insure to the mass of the people their fair share in the comforts and pleasures of life. In other words, what may be termed the fundamental ideas of socialism have touched the conscience of many among well-to-do Englishmen. How deeply these notions have penetrated no one can with confidence affirm. My present object is simply to point out the hold obtained in modern England by notions which, thirty years ago, would have been denounced as socialistic, and which, because they savored of socialism, would have been scouted by every educated man of common sense. The plain truth is, that any one who can look back to 1848, and cares to trace the course of opinion, will, if he looks facts in the face, recognize that since that year of revolutions a change has taken place in the average tone of English opinion, which may in the course of a few years more amount to something like an intellectual and moral revolution. The idea prevalent at that date among all Liberals, and, though less markedly, among ordinary Conservatives, was the notion—a notion, I ought fairly to add, in which there appears to me to be far more truth than is now generally acknowledged—that individual and national prosperity could be secured only by individual freedom, and that, as a necessary consequence, the course of true statesmanship was to minimize in every legitimate manner the interference of the state.

How strong was this sentiment may be seen in all the literature of 1848–'54. Maurice, Kingsley, and their followers incurred, thirty or thirty-five years ago, far more discredit with many classes by their Christian socialism than by what would now be termed their very orthodox heterodoxy. The Exhibition of 1851 was the public celebration, so to speak, of the triumph of free trade, and of all the ideas of progress of which free trade was, as it were, the outward and visible sign. When in 1853–54 the Crimean war overtaxed the energy of a military and administrative system which was apparently somewhat out of date, the general cry was that the errors of the Government officers ought to be corrected by lessons from the admirable energy and resource of private firms. The "Circumlocution Office," an expression which will long survive the memory of the book in which it occurs, is a permanent memorial of a past and almost forgotten state of opinion, under which men seriously believed that Government officials mainly employed their energies in checking the ardor and baffling the ingenuity of ingenious inventors. If historians want more solemn but certainly not more convincing evidence as to the state of feeling or opinion some thirty years back than can be given by Charles Dickens, they should turn to Buckle's first volume. The book was published in 1859, but the author of the 'History of Civilization' was emphatically the spokesman of 1851. The one moral of his work is, that the only way to promote progress is to trust in the energies of individuals and to distrust the interference of the state.

A cursory study of the statute-book is sufficient to show that the current of opinion has for the last thirty years and more set exactly in the opposite direction to that in which Buckle and his generation held that it ought to flow. In all matters, great or small, the activity and the interference of the state have increased. The state has, under the Factory Acts and other enactments of the like nature, interfered with the labor of the people. The state has taken upon itself the responsibility for popular education. The state controls in many respects the carrying business of the country as conducted by railways. The state has undertaken the whole business of the telegraph companies. The state has in Ireland interfered to regulate the contract between landlord and tenant. Nor, in reckoning up the amount of intervention exercised by the state, must we confine our attention to powers exercised by the central government. It is a delusion to imagine that to extend the powers of local government is to diminish the powers of the state. The state interferes none the less truly when it interferes through local bodies, say a school board, than when it directly intervenes by means of a Government inspector. Take this fact into consideration, and you perceive at once that in modern England the sphere of state interference has, during the last thirty years, been widened to an extent which would have amazed and probably horrified the theorists or statesmen of 1848 or 1850. No one, further, can doubt that this continuous extension of the powers of the state is, in a country like England, the result of the set of public opinion. When we now find suggestions put forward that the state should undertake to house the people, we must recognize the fact that this demand, whether reasonable or unreasonable, wise or unwise, represents, even if it exaggerates, feelings or convictions which underlie what I have termed a social movement. In my future letters I shall, with your permission, say something as to the causes of this movement, and something also by way of criticism upon its tendencies. A. V. DICEY.

THE CROWN PRINCE IN ROME.

THE GERMAN VIEW.

BERLIN, December 18, 1883.

FOR the last two weeks the public interest of Germany, if not of Europe, has centred in the visit of the Crown Prince to King Alphonso of Spain, and in his further visit to Rome. If there ever was a high political demonstration, it was this dreary winter voyage, with storms in the Mediterranean and snowfalls in Spain. The Prince is a very popular man, and eager for popularity; he likes to show himself in public and to be admired. It is the more easy for him to win golden opinions as he is a handsome man, of prepossessing manners, and a representative of the finest German type. To use a slang expression, he looks and acts as if he had been expressly prepared for the Spanish market. Apart from these personalities, an unmistakable hint was given to France, the effect of which was increased by the enthusiastic reception of the German Crown Prince by the Spanish people. Not a single dissonance disturbed his triumphal tour from Valencia to Madrid and Barcelona. There was good feeling all around, and even the Spanish republicans abstained from any demonstration calculated to jeopard the tact and good breeding of the nation as well as the feelings of its guest. From a political point of view the royal visit has had the desired effect. Not that an alliance with Spain has been entered into (which under any circumstances would be of no great material value), but the political and intellectual vassalage of Spain in respect to France has been broken, and Germany has, for the next war, at least, won a friend south of France.

The extension of the Crown Prince's trip to Rome took everybody by surprise. Not a word of it had leaked out when the telegraph first brought the news from Madrid. (Let me state, by the way, that in regard to secrecy no civil service is better organized than that of our Foreign Department. Woe to the officer who is not discreet, or who abuses the trust confided to him. His doom is sealed at once.) The plan of this Roman trip originated with and was carried out by Bismarck. Now imagine his wrath when it prematurely transpired by the blunder of one of the attachés of the Crown Prince's surroundings. As the official reporter of the movements of his master, he telegraphed from Madrid to Berlin, that the Crown Prince, before his return home, had been advised to pay a visit to the Pope in Rome. The official telegraphic bureau here published the news, which, considering the source from which it came, was of course regarded as correct, and made an immense impression all over Europe. Fully to appreciate its bearing, I must add, that on that same day the decree pardoning Bishop Blum of Limburg was published, and that it was even granted without any counter concessions from Rome. This giving-in astonished every one, and looked very much like an unconditional surrender to the insolent demands of the Roman see; and now the Crown Prince seemed to be chosen to conclude an ignominious peace. Thereupon all the official and officious hounds were let loose by Bismarck. Statements and counter statements, telegraphic orders and counter orders, created confusion and even bewilderment in political and non-political circles. There was a keen method in fabricating rumors, mixing truth with fiction, and leading public opinion astray.

I do not pretend to be initiated into Bismarck's plans, but his tactics were wonderfully successful. The spreading of all sorts of rumors and the obscuring of the real state of affairs made people still more suspicious and distrustful. I, however, have not doubted that from the beginning a visit of the Crown Prince had been planned to the King of Italy, and that it was to precede that to the Pope; but I cannot say what the Chancellor's designs were as to Rome, as I do not know his instructions. The painful impression of the first telegraphic despatches has already modified a part of the first programme, laying the greater stress on the Crown Prince's visit to the King of Italy at the Quirinal. Nevertheless, people here are astonished that Bismarck has dared to implicate the heir to the throne in negotiations which are of a rather doubtful character, and that he identifies the future ruler of Germany with his designs, thus rendering himself indispensable to him. The telegraph will inform you of the results of the Crown Prince's trip to Rome before this letter arrives. In the present complication of affairs, the negotiations with the Pope, if they should be resorted to, will have no immediate result. Thus everything will pass off smoothly and pleasantly. It would, indeed, be a strange spectacle to make the heir of a proud empire the harbinger of, or rather the humble petitioner for, peace before an overbearing Pope, who, if the European Powers better appreciated their vital interests, ought to be treated as a tenant at sufferance instead of a sovereign.

Our home policy is as disagreeable and unpleasant as it can be. I need not here again repeat that our leading men are steering in a reactionary course. What every lover of his country complains of is the tone in which important state questions are treated in the Landtag, and the frivolity and ill-temper which the Secretary of the Interior especially has intro-

duced into the debates. Mr. von Puttkamer is a gentleman of very indifferent ability, an awkward, narrow-minded, and insolent debater, and rather a reckless partisan than a statesman. Thus he injures the cause which he is appointed to defend, and ruins all measures which require statesmanlike arguments. The bitter tone of his personal attacks, the venomous slander of his adversaries, and the impotent rage of his feelings only tend to strengthen the Liberal cause. Even his Conservative supporters in and out of the Prussian Landtag do not dare to defend him, and often disavow him in their speeches and papers.

The other day a Mr. Stern, a Liberal deputy, made a motion to abolish open voting in the elections to the Landtag, and to substitute the secret ballot, which is the law of election for the Reichstag, and has thus far never given any trouble. The demand was as just as it could be; at all events it could not be treated as an experiment or a quite new principle, having already been engrafted on the statute-book more than seventeen years ago. The motive of Mr. Stern's motion was the fact that the Government of late had interfered with almost all the elections for the Landtag; that it had kept strict control of the vote of each of its officers, and that it had punished them in case of opposition to the Government's candidate. The large manufacturers treated their workingmen in the same style; in short, the so-called free voting thus became a sham and a humbug worthy of the palmiest days of Louis Napoleon. Mr. von Puttkamer, of course, opposed the motion; but what are his reasons? "The right of voting," he says, "is a trust granted to the elector in the public interest; that right, therefore, can only find its expression in an open vote. He who enjoys the right of casting his vote should have the courage to exercise it publicly." In the same strain the minister intimated what he meant by courage. The Government, he continued, could not promote or distinguish an officer of whom it became known that he had rendered himself guilty of opposition or even of open hostility to the Government. Now, the officer's opposition to a governmental candidate can only become notorious by his public vote. In order to catch him, Puttkamer appeals to his sense of honor to make him vote publicly. By law even a minister cannot remove an officer, but whatever he can do to ruin him is and will be done, according to Puttkamer's confession. First, such a poor man for all time to come is left in the place which he occupied at the time of his offence. Next, he receives no Christmas gratuity, no increase of salary, no promotion, and, finally, to corrupt him or to break his stiff neck, he is very often sent to a smaller out-of-the-way town, where there are no schools, or to a place where living is dearer. It is the most infamous proceeding ever practised by an absolute Government, an outrageous corruption which extends its fangs to all parts of the country, and reaches several hundred thousands of clerks, railroad and telegraph employees, letter-carriers and teachers, this last class being most hated by the ministers. In keeping with this view, a Conservative leader openly declared in the Landtag that the employee who voted against the candidate of his employer, deceived the latter "cold-bloodedly," and that the secret ballot was the stepping-stone to deception and fraud. On the final vote on the measure, the minister obtained a small majority, as the National Liberals, with a blindness which comes near stupidity, and for reasons known only to themselves, joined the reactionary time-servers.

Mr. von Puttkamer, however, did not stop with the above sample of rigmarole. He concluded his speech with the threat that Prussia would also take measures to have the secret ballot abolished for the elections to the Reichstag. This was a really amusing manœuvre, by which he tried to please his master. The secret and universal suffrage for the Reichstag was introduced by Prince Bismarck himself for the purpose of winning over the masses, to the detriment of the middle classes (the "bourgeoisie"), which up to 1866 had resisted his policy. Now that the peasants and workingmen by their votes have forfeited the confidence of the Chancellor, he proposes to invalidate their political power. In 1872 he contemptuously said of the indirect, three-class suffrage, that no absurder and meaner system had ever been concocted by the most stupid brains in any country; but now he finds it much better than universal suffrage, and tries to put down the latter by the former. On this question, however, the Reichstag, with the exception of the Conservatives, will be a unit in defending its rights, nor will it commit harikari when called upon to sacrifice its own dignity and honor. What the servile Bundesrath (Federal Council) will do, is perfectly irrelevant. Prince Bismarck may rest assured of the wisdom of Goethe's words: "Die ich rief die Geister, werd ich nun nicht los." His great mistake is that he blames the defeat of his pet measures upon the mode of election. The fault lies somewhere else; it lies in the system of his home policy. Even the most intricate contrivance of a new electioneering machine will not help him if his policy be not liberal, and in favor, not of a class, but of the whole people. Mr. von Puttkamer is only his poor tool; used to-day, it will to morrow be mercilessly thrown away. + + +

THE ITALIAN (REPUBLICAN) VIEW.

ROME, December 19.

Of course the great event of the day, and indeed the only event of the year, is the arrival of the Crown Prince of Germany in Rome, where the reception festivals, of which I spare you a description (as all the official receptions given in the same city resemble one another like two teardrops), are as magnificent as royal lavishness and municipal capacity for spending public money can make them.

This is not the first visit of "Fritz" to the Eternal City, as it used to be called in the old poetic days; for, as Leo XIII. reminded him, he came to Rome just thirty years ago, on the very day when he, Monsignor Pecci, was created Cardinal by Pio Nono. Again he visited Rome, the capital of united Italy, for the funeral of King Victor Emmanuel, in 1878, and was then, without exception, the most popular of all the guests, crowned, crownless, or awaiting crowns; and no pains were spared on the part of Italians, from every province and of all parties save one, to welcome with grateful homage the representative of that great Power which, in crushing the Second Empire at Sedan, had restored Rome to Italy, even as at Sadowa it had freed Venice from the chains of Austria. To Italian gratitude for these inestimable boons was added genuine admiration for the haughty Chancellor who defied the spiritual, even as he had destroyed the temporal, power of the Papacy. To the Crown Prince in Rome, as to his imperial father in Milan, was yielded the most unanimous and genuine homage that a southern race can lavish in an hour of true enthusiasm.

But now this popular element is absent from to-day's reception. If you read the non-official telegrams from Genoa, you will learn how imposing was the official ceremony, how picturesque the meeting of the squadrons, how numerous the concourse of princes, courtiers, prefects, state, provincial, and municipal authorities; but of a welcome by the proud Ligurians, or of the workingmen of Genoa, foremost in all patriotic work or demonstrations, never a word. Even so in Rome. When last the Crown Prince arrived at the station, you could have walked literally on the people's heads, and the parting salutations were even more significant. Now, nothing that is not strictly official marks the Prince's coming and going; and since his visit to the Vatican there is visible hostility on the faces, in the gestures of many, while the Liberal press is unanimous and out-spoken in its censure. "Yesterday he came as a friend," say the people, "a friend of ours and of liberty; now, instead, he comes as the friend of our enemies, of the Pope and of Austria, and who is not for us is against us." The Italo-Austro-Hungarian-Germanic alliance has long been recognized by the thinking and reading portion of the community as an accomplished fact, but none the less a fact abhorrent to the Italians in general, as far as Austria is concerned, while, for the great uneducated public it was deemed a thing too monstrous to be possible, so that always it has sufficed for a newspaper or for a popular orator to speak of King Humbert as the "Austrian Colonel," to arouse a feeling of aversion against the otherwise not unpopular young King. He is, in fact, Colonel of the (most hated of Austrian names) Haynau Regiment.

But this is not the worst. That the Crown Prince is a guest at the Quirinal (in the great palace or the small counts for nothing), and as such is received with all honors at the Vatican, signifies that the challenge between Church and state has been withdrawn, and that the principals have shaken hands on the ground without a combat. That this would be the case was a foregone conclusion in the minds of many, when Pio Nono and Victor Emmanuel, dying within a month of each other, were succeeded by two such very moderate men as King Humbert and Leo XIII. But for the violent opposition, scarcely stopping short of actual violence, of the Jesuits and their partisans, Leo XIII. would have blessed the Roman populace from the outer balcony on his accession—in fact, all the scaffoldings and decorations were prepared, and only removed by the hostile faction at the last moment. It was thought, indeed, that they were going to make a fresh stand for the recuperation of the temporal power; but these true children of darkness were wiser in their generation than the children of light, knew better the character, education, and tendencies of the new royal family, and of the ministers that were likely to direct the helm of state. Nothing short of a miracle could, they were well aware, unite again the crown of the Cæsars with the tiara of the Pope; but sufficient patience and clever manœuvring might, in a not far-off period, restore to the Roman Catholic clergy the schools and the government of the municipalities, which is tantamount to handing over to the Church of Rome the education of the young generations and the finances of the state. Hence their cry of no surrender, a tame repetition of old Pio's *non possumus*. The Pope must remain a prisoner in the Vatican, all good Catholics must muster in full strength at the provincial and municipal elections—these being purely administrative and implying no allegiance to the usurping King; but the old programme, "neither electors nor elected" (to the Italian National Parliament), must remain intact for the present at least. On their side, they had and have a silent, almost invisible, but all-powerful ally in Queen Margaret, a true scion of the old brave, bigoted House of Savoy, who would rejoice, were it possible, to send freethinkers and republicans to the stake, as in the old Waldensian

days, and who, this being impossible, contents herself by bringing up the future King of Italy in the way the Jesuits would have him go, leaving his kingly father and tutors free in all else regarding his education.

It is difficult to exaggerate the amount of ground won back by the clergy since the death of Pio Nono, and since—alas! we must say—the advent of the Left to power. Six years ago a religious procession in the public streets was a thing unheard of, save perhaps in the most besotted quarters of Naples; now, this very year, the *Corpus Domini* processions have been renewed with all their old pomp. In many of the public schools, whence religious instruction had been banished, it has been restored—this being a simple consequence of the triumph of the Catholic party at the electoral urns of the provinces and the communes, as the municipal and the provincial councils control the expenses of the primary schools. All that I assert is proved by the statistics of the late elections, and is indeed a public and acknowledged fact. At the present moment, the visit of the Crown Prince of Germany to-day to the Quirinal, to-morrow to the Vatican, is claimed by each side as a victory. The partisans of the Vatican say that the future Emperor of Germany came expressly to Rome to treat personally with the Pope and secure peace for the future between Church and state in Germany; and that as he is not actually a guest at the Quirinal, but only at an adjoining palace, as he is a Protestant and not a Catholic sovereign, the Pope has gained all and given nothing. The Prince could, as his imperial father did before him, have visited the King of Italy in any other city of his kingdom, but the Pope could only be seen in Rome, or, more precisely, in the Vatican; consequently, his journey to Rome is taken expressly to do honor to and execute his business with the Pope. The state party says, on the contrary: The Emperor of Germany has found it in his interest, as we find it in ours, to enter into an alliance, and his son comes to our capital to make the fact patent to the world. In no former time would a royal guest of ours have been received at the Vatican. That the future Emperor of Germany *is* so received to-day, proves that the necessity of recognizing the kingdom of Italy is finally acknowledged.

Both parties are, to a certain extent, in the right, and the popular party answers: Divide the honors and the spoils between you; what we see clearly is that you are all allied together. And they chant the old war hymn of Mameli:

> "Un sol campo hanno i popoli,
> Ed un sol campo i re."

And though the outward signs are not as visible or as audible as in the olden days, the real Liberal, radical party is strengthening and increasing daily, organizing its forces, counting its numbers, preparing and hoarding its material. Divided as are the Liberals into unitarian republicans, federalistic republicans, and socialists, they have sufficiently comprehended where lie the chances of victory to merge their private aspirations so as to recruit a disciplined army to fight for the common cause. Death itself, it is true, seems to have become the ally of their adversaries. Of the old revolutionary leaders scarcely one is left on the field: Mazzini, Cattaneo, Garibaldi dead, but not taken before their time; Alberto Mario—in a certain sense the representative of them all—cut down in his prime. Of the old guard you may say but Fabrizi and Bertani are left, past seventy both, both honest and independent members of Parliament. The last great meeting at Bologna, however, when the Fascio of the Democracy was formed, shows at one and the same time the strength of numbers and the discipline of the union. Nor must it be forgotten that they reckon in their ranks men like Saffi (who, by the way, has just completed his introduction to the thirteenth volume of Mazzini's works) and old Campanella, recognized as the continuators of the strictly Unitarian Republican programme.

This explains why, while at Rome King, court, Government authorities, and placemen, are congratulating each other on the now certitude of an Austro-Hungarian-Italo-Germanic alliance, in all the chief cities of Italy, and especially in Leghorn, Sassari, and Bologna, the people are celebrating the anniversary of the execution of Overdank, the last victim hung on an Austrian gibbet at Trieste. The monarchists are counting on the great pilgrimage to the tomb of Victor Emmanuel in January. But no one takes *au sérieux* as a demonstration of loyalty the fact that crowds will make a pleasure excursion to Rome for 10, 16, 20 lire the round trip.

M. W.

CORFU AND ITS SAINTS.

CORFU, November 18, 1883.

WE have held high festival to-day. In memory of a deliverance from the plague in 1630, the relics of St. Spiridion have been carried through the streets and around the Esplanade in solemn procession, with military music and a guard of honor, banners, lanterns, and gigantic candles, priests wearing gorgeous robes of precious old Venetian satin and brocade, and the Prefect and other authorities walking bare-headed. The saint's body, which was plainly visible through the glass casket, is in a fair state of preservation after the fifteen centuries that have elapsed since its first burial. It lacks only one arm, which is in Rome—for as St. Spiridion, who was Archbishop of Tremithus in Cyprus, and flourished at the Council of Nice, lived before the separation of the churches, his memory is as much venerated by Latins as by Orientals. Though in appearance like a mummy, it is not hard and dry, but has somewhat the consistency of India rubber, and this elasticity has enabled it to endure the numerous shocks to which it has been and is still subjected, for as it was carried in erect posture it swayed from side to side against the glass.

The journey of the saint from Constantinople to Corfu was a far ruder one. The piety of the Byzantine Emperors had collected in the capital of Eastern Christendom nearly all the important relics of the Early Church. Some were perhaps fictitious; many, such as they might be, were undoubtedly genuine. What was thought the most valuable booty of the Crusaders when they took Constantinople was the quantity of relics and holy objects which they obtained, which they sent home as gifts without price. From this source came nearly all the relics of the Passion now in Western Europe, and most of those relating to the Saviour or the Virgin. Their authentic history from that date may be traced in the documents published by the Comte de Riant. In some cases the Greeks succeeded in concealing the true relics, and the Latins took only what had been cleverly substituted; in others a forgery was made after the evacuation of the city, for the benefit of the Greeks. When the Turks came, two and a half centuries later, some relics escaped the conqueror, others were destroyed, and others seized for the sake of their jewelled reliquaries. The arm of John the Baptist, for instance, now in the chapel of the Winter Palace at St. Petersburg, we know to be the same that was so long venerated at Constantinople in Byzantine times. Discovered many years after in the Sultan's treasury, it was given as a present to the Grand Master of the Knights at Rhodes, was taken thence to Malta, and brought to Russia by the Emperor Paul, who was the last independent Grand Master of the Knights of Malta.

The body of St. Spiridion, it seems, escaped seizure, and, together with that of St. Theodora, (wife of the Emperor Theophilus the Iconoclast), was brought to Corfu by a certain pious George Calocheretti. In order to conceal the relics from the Turks, they were stuffed into provender bags and covered with straw, and thus passed safely to the coast of Epirus as forage for the mule who bore them. The two saints brought the pious George wealth and happiness, and on his death were a precious legacy to his children. The body of St. Theodora was given to the community and now rests in the cathedral. That of St. Spiridion, after the Corfiotes had been worsted in legal proceedings to prevent it from being removed from the island, and the property of the Calocheretti family had been confirmed by a decree of the Venetian Senate, came to a certain Stamatello Bulgaris, of a well-known Corfiote family, as the dowry of his wife. In the Bulgaris family it has since remained, and has for nearly four hundred years furnished them with an unfailing income.

The church where the saint's body reposes belongs to the Bulgaris family, which always names one of its members as the head priest. The offerings, after expenses are paid, are naturally family property; and as the Corfiotes are a pious folk, and St. Spiridion, for his protection against pest and Turks, and for his numerous miracles, is deservedly popular, and the patron saint of the island, the coffers are never empty. "Che benche forestier egli sia, pe'l lungo albergo, e per gli miracoli, si deve stimar cittadino," says old Marmora. The church is full of silver lamps and votive offerings, and the revenues are estimated at about $10,000 a year. The present priest, still a young man, and the last male member of his branch, is said to have taken orders much against his will in order to save the property to the family. A fair portion goes to one member who has married an English clergyman—the gains of superstition thus devoted to nourish Protestant piety! Truly a proprietary saint—if one may so speak—is a very good thing. I have known of several others. The body of St. Anicetus, Pope, is, or was when I lived in Rome, in the rooms until lately used for the archives of the Council of Trent, the property of the Gallese family; and at least a part of the body of St. Philip Neri, the Oratorian, is the valued possession of Prince Massimo, in the room, now a chapel, where the saint raised from the dead the young Paul Massimo in 1651; but I doubt if either of these families draw a revenue therefrom.

St. Spiridion is not, however, the only saint of Corfu. The island boasts of St. Jason and St. Sosipater, the disciples and even the kinsmen of St. Paul (Rom. xvi. 21), who introduced Christianity, and one of whom at least was martyred here. The church in which they are said to have preached is shown a little below the old basilica dedicated to the Virgin, one of the few remains of the ancient town, built on the ruins of a temple of Isis, showing how naturally the Isis worship passed into that of the Virgin. The church of St. Jason, however, is not of so early a date, but is a small Byzantine vaulted building resembling somewhat the Kutchuk Aya Sophia at Constantinople. With its two palm trees and a laurel over the gate of its half-ruined court, it presents a pretty picture, all the more interesting to us as it contains the tomb of the wife of the last Palæologus, and that of the latest Byzantine historian and diplomatist, Phranzes. Thomas Palæologus, the brother of the last Emperor, Constantine XIII., maintained himself for seven years in the Pelo-

ponnesus after the fall of Constantinople, and in 1460 was obliged to seek Venetian protection in Corfu, with his family and Phranzes, his faithful follower. Thomas, leaving his wife in Corfu, went on to Venice and Rome, and, bringing the head of St. Andrew as an acceptable present to the Pope, was recognized as the heir of Byzantium. His wife, Catharine, the daughter of Asan Zaccaria Centurione, a great lord in the Morea (we wonder if a relative of the great Genoese family of Centurione, that claims descent from Cornelius the Centurion), died suddenly just as she was about leaving Corfu. Her end was perhaps happier than if she had known the fate of her children. Helena, the former Queen of Servia, died a nun in Santa Maura; Zoe married a Russian Grand Duke, and her posterity became merged in the Polish family of Jagellon; Andrew made a wretched marriage in Rome and died childless; Manuel, like his uncle, Demetrius, surrendered to the Sultan, who gave him slaves and concubines. Of his two illegitimate sons, John died a Christian and was buried at the Patriarchate in Constantinople. The other, Andrew, became a Mussulman under the name of Mohammed. Within fifty years from the capture of Constantinople the name of Palæologus was extinct.

Phranzes, who had borne many woes, some almost worse than death, no sooner arrived in Corfu than he became a monk, while his wife betook herself to a convent. Here, in his peaceful cell of Tarkhaniotes, on the request of some noble Corfiotes, he wrote his sad and pathetic 'Chronicon,' which Warsberg justly calls the "first history of the Decline and Fall of the Roman Empire." A year after he had finished it he died, in 1478, at the age of 77; his last request was to be buried by the side of his exiled sovereign. The three tombs had been covered for centuries with whitewash, but the archæological acumen of Baron Warsberg, the Austrian Consul (it was he who had charge of the expedition for refinding the frieze of Gul-Baktche, in Lycia, a year or so ago), added to the researches of Professor Romanos in the archives, found them out. He had the church cleaned, and verified the inscriptions.

But I have wandered far from what I set out with, which was to tell of the picturesque costumes, the lovely faces, and the beautiful figures we saw at the festival of St. Spiridion. The town is almost wholly Venetian and Italian, the country chiefly Greek, but there has been just that mixture of blood necessary for the production of an almost perfect type. Nowhere in Italy, and certainly nowhere in Greece, are such beautiful maidens and youths to be seen. Add to this the soft, sweet landscape, olive trees, and cypresses in proper proportion, pink roses climbing over every wall, the picturesque Venetian citadel, the hills and mountains of Albania, rosy in the sunset over a narrow strip of iridescent sea, and you have an unmatched picture. It is the real "Earthly Paradise," the realm of Alcinous. The costumes of every village differ. All are graceful and pretty, both of men and women. But as Corfu is the meeting place for the whole Adriatic coast, it is, in spite of its Venetian aspect, its civilization, and the band playing on the Esplanade, the most Oriental place this side of Constantinople. Here are old Turks in turban and robe, young Turks in fez and high-buttoned black coats, Softas in Mussulman clerical attire, weak, sad-eyed Montenegrins, fierce-looking, flat-headed, kerchiefed Albanian men, dirty Albanian women covered with embroidery made by that artistic race, Dalmatians and Greeks of all kinds and sorts.

It is a wonder travellers do not come here now, but fortunately it is a little out of the beaten track; and, except English sportsmen, yachting and shooting on the Albanian coast, and a few pleasant people of weak constitutions, the ordinary tourist contents himself with a day or two, in which he scarcely discerns the real beauties of the island. Yet there are two excellent hotels, where one is well lodged, well fed, and well cared for at only twelve francs a day. There are good roads, fine walks and drives, and the opera every evening in the old building of the Venetian archives. Corfu is still as beautiful as when About wrote 'Germaine,' or even when Ulysses saw Nausicaa playing ball with her maids. S.

Correspondence.

THE VOTING POWER OF STOCK.

To the Editor of The Nation:

Sir: I am glad to see in a late issue (No. 965), that you have taken up the subject of "the voting power of stock" in railroad corporations. It is one that has interested me for some time past, as a better remedy than that of the railroad commission now so much in vogue. Indeed, in December, 1882, I introduced a bill in the Legislature of this State (South Carolina) to carry out the views you now urge; but the popular cry then was for a railroad commission, with extreme power like that in Georgia, and I could not obtain a hearing for my plan. Will you allow me to add some considerations to those of your editorial?

Mr. Adams, in his book on the 'Railroad Problem,' observes that—

"The American railroad system may now be said to have passed, wholly or in part, through three distinct phases of growth, the limits of which are merged in each other, though the order of succession is sufficiently clear. First was the period of construction, beginning with the year 1830, and closing with the completion of the Pacific Railroad in 1869. Merged with this period and following upon it was that of active competition, which reached its fullest development in 1876. This naturally was followed by the period of combination, which first assumed a large and definite shape in 1873, and has since that been working itself out into something both definite and practical."

If we recall these periods pointed out by Mr. Adams we shall recollect that in the first—that is, the period of construction—railroads were projected and built without any general system, and mainly with a view to connect some two or three cities. They were built at first almost exclusively by subscriptions in money, material, and labor supplied along the route they followed. They were, in short, local roads run in the interest of the communities through which they passed, and were managed by local directors. But these roads, built as they were without system, came to compete with each other in a manner which soon exhausted their resources. The period of construction was forty years; that of competition was not ten. The period of competition, whether it was in itself connected with the financial crisis of 1873 or was merely contemporaneous with it, ended in universal railroad bankruptcy, and culminated in the receiver's dynasty, when the United States Courts became the managers of the railroad system of the country. Then came the sales under orders of court, at which the stocks and bonds which represented the savings of forty odd years were bought up by capitalists at ten and twenty cents on the dollar, and the public highways became, in the opinion of the few purchasers, private property. This was the inauguration of the present period of combination and consolidation, when the purposes for which the roads were originally built are subordinated to other interests, and their managements taken from local directors and given over to strangers. The crying evil of railroad management is precisely that of the real grievance of the Irish peasant—it is the control of local interests by absentees.

If, then, consolidation is the evil, we should seek our remedy in some measure calculated to counteract it. We should seek some measure to curb the dictation of the fifty-one one-hundredths of stock. Fortunately, this is in the power of all those States which, as did Massachusetts and South Carolina, upon the decision of the Dartmouth College case, make it a part of their fundamental law, that all charters granted by them should be subject to amendment, alteration, or repeal, unless expressly exempted in the charters themselves.

The direction, then, in which I would seek remedies for railroad evils is in the amendment of our railroad charters; and in doing this (1) I would fix the number of directors of each board, and give them the sole power, acting as a board, to fix, change, or alter the rates and tariffs, and would require the rates so fixed or changed to be certified by the signatures of a majority of the board before any change or alteration should go into effect. (2) I would require that a majority, at least, of the directors should be residents of the State granting the charter, as is now required by several of the States—for instance, Massachusetts, Illinois, and Texas. (3) I would revive the provisions of the earlier railroad charters for the protection of minorities, by means of a scale of voting; and (4) I would adopt a mononomial plan of voting, so that each director should be voted for separately, and not upon a general ticket; and that in their election each share should have a vote for but one director.

Let me illustrate how this system would work. Suppose a road had a stock consisting of 18,000 shares, and that this road ran through eighteen towns. Under the usual system, by which each share has a vote on a general ticket, not one of these towns can secure a director or voice in the management of the road, unless it secures 51-100 of the stock, which, of course, will give it the entire control. Before a person or a community can have a word to say about the management of a railroad, he must be prepared to assume the responsibility of its entire control, and go to the cost of a purchase of a majority of the stock. But, under the mononomial plan, any one of the eighteen towns along the road, by securing one-eighteenth part of the stock, can be sure of a director, and a voice in the affairs of the company. The tendency of this system, it will be observed, would be to scatter and disperse the shares. It would add to their value; for, besides the dividends, it would give a substantial value to each share in its potential control in the management of the road. The result of the system would be that the stock would increase in value, and power to control would be returned to the holders of small amounts. In short, it would give the public a voice in the management of our highways. It would, at least, render it more difficult to "bear" the market, and give less occasion to do so, as a mere majority of the stock would not give the control it now does.

In this way I would provide for the management of our railroads in the interests of those who built them, by and through the means of the corporations themselves—from within, instead of from without, as by the system of railroad commissioners with power to fix rates. I would meet consolidation by disintegration. I would substitute "home rule" for the injurious control of absentees.

Edward McCrady, Jr.

Charleston, S. C., January 2, 1884.

EXECUTIVE GOVERNMENT.

To the Editor of The Nation:

Sir: I beg to offer "S. M. C." my sincere thanks. In political discussion, an opponent is almost as valuable as a supporter. The most discouraging thing is (*crede experto*) to go on for years and find nobody paying any attention to anything you say.

I read the article of M. de Laveleye with intense pleasure, as containing that with which I most heartily sympathize—a hopeful view of the prospects of the Republic in France. But I think "S. M. C." hardly represents his position fairly. He is meeting the complaint that the Deputies show "a lack of consistency as regards their resolutions; that they overthrow ministers too frequently, and thus render any stable government an impossibility"; and he argues that parliamentary government encounters the same difficulty in other countries, as Holland, Belgium, Italy, and England, though I think he overstates the case a good deal as to the latter. But this is very far from saying that executive government is not necessary. The history of France for a century is a struggle to obtain executive power strong enough to govern, and yet responsible to the public will. All the signs are that she must work out this problem under the alternative penalty of falling again under military despotism. But the weakest of these parliamentary governments is strong as compared with our system of practically no executive at all. We may well be thankful that we have not to deal with the political and social problems of Europe, but he would be a bold man who should assert that there are no questions in this country which require Government settlement. And I maintain that since the war, Congress has never been able to settle anything at all. There are some things which the people can do—the more the better; but there are others which, if society is to hold together, must be done by the Government.

To give the Cabinet seats in Congress would be to give the Executive, what it has not now, a voice as to the policy and conduct of the Government, and some power of resistance to the lobby. It does not necessarily follow that the Cabinet must resign when it differs from Congress any more than it does now. What the course of development of the measure would be can only be known by experiment, and to attempt to forecast it would require more of your space than I dare ask for. Of one thing I am sure, that the experiment would be heartily welcomed by the country, and would do more than anything else to indicate some way of bringing order out of our present chaos. G. B.

Boston, January 5, 1884.

THE MORMON PROBLEM.

To the Editor of The Nation:

Sir: Is not the difficulty in solving the Mormon problem in one sense an evidence of the excellence of our Government? Here is a community defying the laws and authority of the United States, engaged in the commission of a crime repulsive to all the civilized world, and yet such are the safeguards thrown about local self-government that the whole nation stands puzzled—uncertain how to punish the criminals or to abate the nuisance.

It is the same trouble that is found in enforcing a prohibition law, or laws against homicide in the South. Under our system of government, it is impossible to compel a community to be more moral than it chooses to be. Usually, the gradual diffusion of knowledge, the desire to have a good reputation with the outside world, and to grow in wealth and population, are all-powerful influences to bring such communities up to the proper moral standard. But in Utah none of these influences are at work. Ignorance is their stronghold. They care nothing about their reputation abroad. They do not desire to grow in Gentile wealth or population. All they want is to be let alone. This is an anomalous state of affairs, and will doubtless demand an unusual remedy.

E. B. H.

Butte, Montana, December 26, 1883.

THE STUDY OF DIALECTIC GREEK.

To the Editor of The Nation:

Sir: Permit one who is not engaged in teaching the classics to seek a little information from those that are, on a matter that may perhaps have some bearing on the discussion lately carried on in your columns. In our colleges and universities, so far as I am acquainted with the courses of study, the languages commonly taught are Latin, Greek, French, and German. Of these four, the much-assailed Greek is, beyond all question, far more difficult than any of the others. This will be granted by nearly every one, I imagine. Now, out of these four languages Greek is precisely the one in which the natural difficulty is increased by the study of *dialects*—at least so far as I know. In some instances boys are expected to *come* to college with some knowledge of Homer, the study of which is then carried on further, with perhaps other dialects added. I wish, therefore, to ask the following questions:

1. Is not the course in French and German in our colleges confined almost exclusively to the modern languages? Having myself taught these languages, I have noticed the catalogues of other colleges, and have never found any exception to the rule. In German, the acquisition of a vocabulary is certainly difficult enough to let us confine our students to modern German. Professor Whitney says, in the preface to the dictionary and notes prepared for his 'German Reader': "To gain a tolerable mastery of the German vocabulary is so very serious a task, that he who undertakes it is fairly entitled to have its beginning made easy to him by special helps." Suppose, now, that after taking our students on till they were beginning to be able to pick their way along in Whitney's 'Reader,' with some little feeling that they were getting a hold on German, we set them to reading the 'Nibelungenlied,' or German of the time of Luther or Fritz Reuter; what would be the effect on them? Do we not feel, and act on the feeling too, that if they know the grammar well, and, as Whitney puts it, have "broken the back" of the modern German vocabulary, that is about as much as we have time for in our limited college courses, and that any dialectic study of German should be reserved for those who may wish to take this up afterward? And yet in Greek our colleges must teach Attic prose as the basis of all, the Tragedians (and certainly their vocabulary contains an immense amount for which prose gives no help), Herodotus (which can very well afford to be included, however), Homer (with his almost unending array of new forms, and new words, and new meanings), with perhaps Theocritus, and possibly a taste of still other dialectic writers.

2. The field of Attic Greek is certainly large enough to furnish abundant and profitable labor for all the time American young men spend at college; and if this time were trebled, the remark would still be true. Would not a young man leave college with as liberal and broad an education in Greek if he were allowed to do in this difficult language what is done in the far easier German, viz.: confine his study to that form of the Greek in which the foundation must ever be laid, reading more of its authors and larger amounts from them? He would be studying excellent Greek, would be associating with thinking minds, and would have more of a feeling that he *knew* Greek and could *read* it without having to keep a dictionary everlastingly chained to his elbow. Then, if he chose to continue his Greek after leaving college, he could take up the dialects to suit himself.

3. Is it not possible that this system of teaching may have something to do with the reaction against *Greek*, which usually has to bear alone the brunt of the attacks upon classical studies? Is not the student's command over Greek weakened by his being obliged to scatter his strength over so much ground? What student of a language does not look forward with pleasure to the time when he can be emancipated from the drudgery of incessant dictionary work? This is the way in which he tests his knowledge. But in Greek, although it is a pretty huge undertaking to master "tolerably" the vocabulary of Attic prose, he finds himself forced to undertake prose, poetry, and dialects, and, if the truth were told, largely because their teachers would be afraid to send out their catalogues without these time-honored names. Hans Andersen, in his inimitable story, "The Emperor's New Clothes," hit off the true secret of an immense deal of humbug: for fear of being thought "dumm," or unfit for their office, men are afraid to have the courage of their convictions, and profess to find an invisible dress extremely beautiful.—Respectfully,

E. M. S.

Notes.

Mr. Edward Armitage's 'Lectures on Painting,' delivered to the students of the Royal Academy, we noticed, a few weeks ago, from the London edition of Trübner & Co. The Messrs. Putnam have now reprinted this work in a very substantial and attractive manner for the American market.

Mr. Gilmour's very entertaining work, 'Among the Mongols,' which we reviewed last week, naming the English publishers, had already been printed in this country by the American Tract Society, which purchased the plates of the original edition.

The 'Life of Cobbett,' by Mr. Robert Waters, to which Cobbett's 'Grammar of the English Language' was appended, is also among the works we have recently mentioned. But we can now add that the Grammar has been issued separately for such as may need it (New York: James W. Pratt). The *form* of Cobbett's work is what gives it its chief value in the teaching of what is commonly a repulsive study. Teachers can profit by this who may be unable to comment independently either on his text or on Mr. Waters's notes.

The American Unitarian Association (Boston) have yielded to a demand for a dollar edition of the complete works of the late Dr. Orville Dewey, uniform with that already put forth in the case of Doctor Channing. The volume, with its index, fills 800 pages 8vo. A very brief sketch of Doctor Dewey's life, prefixed to the sermons, makes no allusion to his contact and conflict with the greatest moral reform of his time.

Miss Sarah E. Titcomb's 'Early New England People'—an informal genealogical repository of facts concerning a large number of related families—has been transferred, for the sale of the remainder of the edition, to Mr. Charles L. Woodward, of this city.

Three more volumes extend to the eleventh the complete works of Emerson (Boston: Houghton, Mifflin & Co.). The ninth embraces the

Poems, not omitting, we are glad to see, some at least of the epigraphic verses scattered through the prose volumes; and it is further adorned with a steel portrait of Emerson in his latter years. To the tenth volume the title 'Lectures and Biographical Sketches' has been given. In this medley are gathered (with appropriate indications of the source) writings from the *Dial*, with sundry addresses and descriptions of Emerson's contemporaries—among these the posthumous publications in the *Atlantic* on Dr. Ripley, his aunt Mary Moody Emerson, etc. Four pages on the Chardon Street Convention of 1840 are a marvel of condensed characterization and "reporting." The last volume, 'Miscellanies,' has also a number of addresses, most of them political and relating to slavery, and some matter hitherto unpublished. The town bi-centenary discourse at Concord in 1835 has a peculiar interest, and, together with the short paper just named, and the longer 'Historic Notes of Life and Letters in New England,' shows possibilities of historical presentation that were, unhappily, destined never to be more fully realized.

The second series of University Studies, edited, at the Johns Hopkins University, by Dr. Herbert B. Adams, will shortly be begun in a number entitled "New Methods of Study in History," by the editor (his paper read before the Social Science Association at Saratoga last September). Some of the more interesting and curious subjects announced to be treated in this series are, "Review of American Economic Literature since 1876" (B. J. Ramage); "History of Taxation in the United States, 1789–1816" (H. C. Adams); "The Irrepressible Conflict" (H. von Holst); "Indian Money as a Factor in New England Civilization" (W. B. Weeden); "Icaria: a chapter in the History of Communism" (Albert Shaw); and "Rudimentary Society among Boys: (1) Land Tenure, (2) Judicial Procedure" (John Johnson).

The enlarged number and novel complexion of the House of Representatives make the Congressional Directory for the Forty-eighth Congress, officially compiled by Mr. Ben: Perley Poore, an exceptional issue.

Speaking of Government publications, it may be news to some of our readers that James Anglim & Co., 1424 F Street, Washington, issue a monthly bulletin of them, free "to all dealers, book-buyers, and librarians." The prices are attached. The same service is performed, we think quarterly, by the *Publishers' Weekly* of this city, with more bibliographical accuracy.

The army worm and the cotton worm in particular are the subjects of the latest Bulletin of the Entomological Division of the Department of Agriculture, but certain tree-borers of the Cossidæ family are honored with colored plates. Professor McMurthrie reports (also with illustrations) his microscopic examination, for fineness and tensile strength, of eight samples of silk grown in this country.

A pamphlet for free distribution, on "Silk Farming in Florida," by Mrs. Ellen Call Long, bears no indication of date or locality. But we recognize the compiler as having written more briefly on this subject for the *Florida Annual*, which we lately noticed.

Science begins its third volume and second year with a change in the typography and color of the cover, and also alters the scheme of its contents by omitting the customary "Weekly Summary of the Progress of Science," the classified work of many hands. This step is excused, in an editorial article discussing the past and future of this periodical, on the ground of a desire to popularize the contents by enhancing their readability. In this view, the omission is fully justified, while specialists will doubtless regret to be deprived of the particular digests in which they were respectively interested. *Nature*, however, has done very well without them, and, speaking wholly from the layman's point of view, we criticised these, at the very beginning, as a bar to the popularity of *Science*.

We are glad to welcome the first numbers of *Woods and Forests*, a new weekly journal published in London by Mr. William Robinson, who is also the editor and publisher of the useful London *Garden*. The purpose of this new venture is to stimulate a love of planting, by furnishing accurate information on subjects of practical interest to the planter for use or ornament. *Woods and Forests* certainly meets a real want, and deserves every encouragement. It is the only journal in the English language, with the exception of the English *Journal of Forestry*, devoted exclusively to a subject which begins to attract wide attention in this country, where the need is felt of instruction and suggestions about methods of planting and the care of woodlands and ornamental trees. There is hardly room, however, yet for a corresponding American journal. *Woods and Forests* might, therefore, well be somewhat extended in its scope, and be made to supply American as well as English readers with information in regard to their trees and plantations. Mr. Robinson, it is safe to say, will be very grateful for any contribution from this country, or for any information about American forests or American trees.

Now is the season for new journalistic ventures. The most important that we have noticed is the quarterly *Rivista Storica Italiana* (Turin, Bocca), which is to treat of the history of the whole peninsula, previously existing historical journals having been local in character.

A very useful manual of Italian literature, coming down to the present decade, is that of K. Marquard Sauer, published under the title: 'Geschichte der italienischen Litteratur' (Leipzig, 1883), and forming a sequel to Engel's 'French Literature' and Nitschmann's 'Polish Literature.' Sauer's compendium is handy for the general reader, and discards all semblance of erudition, for the sake of rendering itself accessible to the popular mind. A large number of selections are interspersed in the form of translations from the authors spoken of, and Sauer himself often figures among the translators. In giving opinions he generally relies upon his own judgment, We can barely refer to his notice of Macchiavelli, who was, he says, the first to establish, in his 'Discorsi' and 'Principe,' a system of "duplex morals," giving numerous reasons for his opinion that civic must necessarily differ from political morality, since in politics one principle only is admissible, namely, that of utility. Macchiavelli insists, however, that the only aim of rulers must be the liberty and independence of their country, whether the means employed by them be moral or immoral. Sauer concurs with Settembrini in holding that the 'Principe,' with its Jesuitic tendency, was written simply to show the method by which, under existing circumstances, a demoralized nation could be raised from nothingness to political concord, unity, and significance; and that Macchiavelli, in composing the book, was impelled by no other than purely patriotic motives.

La Philosophie Positive is to be discontinued. Its editors, MM. Robin and Wyronboff, say that the passion for ideas which existed fifteen years ago, when it was founded by M. Littré, has passed away, and that the public is interested now in nothing that is not practical. Those who write and those who read are no longer concerned with high scientific syntheses, and the review disappears before the general indifference for questions of philosophy. It would seem that the indifference which is felt towards this particular exponent of philosophy is even greater in England than in France; for *Nature*, in announcing its discontinuance, gives M. Wironboff as its editor and *La Revue Positive* as its name.

In the case of the one hundred and twenty-first issue of so old, so authoritative, and so unique a publication as the *Almanach de Gotha* (New York: B. Westermann & Co.), the editors themselves find it nearly as difficult to say anything fresh as does the reviewer. They display their consciousness of this by calling attention at some length to the slight put upon the value of the *Almanach* by those who think it a mere repository of princely genealogies, whereas, they say truly, its politico-statistical information is unsurpassed for accuracy. Relatively, the past year has been free from changes, the ministerial disturbances having been chiefly confined to France and the Iberian peninsula. But the census returns of various countries have been enlarged and are here made use of. In a single point, under the rubric of the United States, the editors are at fault, for Mr. David Davis is set down as Vice-President. The portraits this year are of the Duke and Duchess of Albany, Princess Victoria of Prussia, and Count Otho of Stolberg-Wernigerode.

—Somewhat more than two years ago, the city authorities of Boston permitted the printing of the first volume of Suffolk Deeds (the deeds, that is to say, of the county in which Boston is situated). The second volume of these "worn, mutilated, and [more or less] illegible" records has also, upon petition of the Suffolk bar, been printed, and was distributed just before the close of the past year. Extraordinary pains have been taken to insure textual accuracy by Mr. Wm. B. Trask, and Mr. John T. Hassam has contributed exhaustive indexes of grantors, grantees, "other persons," places, and miscellaneous. A few historically famous names, like those of Simon Bradstreet, Daniel Gookin, John Endicott, John Winthrop, Richard Bellingham, and Samuel Maverick, appear here; but the majority have a family rather than an individual interest. The Indian element of the colony makes itself visible in two or three instances, as in the sale of lands by Quoshamakin (Quochamatins), sachem or sagamore of Massachusetts. The negro puts in a single appearance, but much to his credit. "Bostian Ken" (*videlicet* Sebastian Kajne or Keayne), "commonly called Bus Bus, Negro, of Dorchester, in New England," mortgages his house and land, with four and a half acres of standing wheat, to complete the purchase of one "Angola Negro," to whom Mrs. Anna Keayne had "souljd his tjme for Eighteene pounds." Angola's "tjme of freedome" was to begin on the 10th day of the sixth month, 1656. On the 24th of December Mrs. Keayne ordered the mortgage cancelled. The mother country is constantly referred to in these deeds, coupled not seldom with valuable genealogical particulars. "Whereas," begins an instrument bearing date of June 22, 1654, "My honnored and beloued father, Peeter Noys Late of Penton in the County of Hampsheere in old Englande now of Sutbury in New England in the County of Midelsex Gent," etc. Only the southern counties, the index shows us, from Norwich to Bristol, are thus recorded. Some inns are mentioned, as the Golden Crown, Birchin Lane, London; the Golden Key, Watling Street; the Ram's Head, Southwark. Not a few names of ships are preserved—a later *Mayflower* among them—with specific appella-

tions, of which several have become obsolete, while, on the other hand, it might be a fair inference that down to 1656 the term "snow," for example, had not come into use. For the local topography of Boston and its suburbs this volume is, of course, invaluable, and the city has done well to rescue such interesting and precious memorials of its early state.

—The annual report of President Angell, of the University of Michigan, just published, gives an encouraging account of the advanced studies now carried on at that institution. He reports that the average age of undergraduates at the end of their second year is something over twenty-one years, and that on account of this maturity the Faculty have deemed it safe and wise to leave to them an almost unlimited freedom in the choice of their studies. The experiment is regarded as successful. With few exceptions, studies are carried on "with a definite and high purpose, and with an earnest spirit." The Faculty has found that "what is known in Germany as the 'seminary' method of work is peculiarly adapted to secure the best results in advanced work in certain branches, as, for instance, history, political economy, finance, English literature, and some kinds of classical investigation." A plan has also been introduced by which a student who has creditably completed the first two years of his course may, at the beginning of the third year, be permitted to confine his attention for the remaining two years to three branches, one being taken as his major or principal subject, and two others as his minor or subsidiary subjects. The primary aim of this arrangement is to enable the most gifted students to concentrate their energies, and to advance as far as possible upon certain definite lines. The final examinations under it are conducted substantially as in Germany, each student being subjected by a committee of the Faculty to an oral examination from two to three hours in length. The public are invited to the reading of the theses and the examinations on them, but not to the oral examinations on the major and minor subjects. The President reports that the examinations were "rigorous and searching," and that, though some of the candidates for higher degrees failed on examination, seventeen candidates obtained the Master's degree. The number of applicants for advanced degrees nearly doubled during the past year, though the total attendance at the University in all its departments was a trifle less than in the year preceding.

—Accompanying the President's report is also the report of Professor Adams, the Dean of the School of Political Science. The grouping of studies offered by that school shows that there were given last year twelve courses in history, eight courses in the economic sciences, three courses in social, sanitary, and educational science, and six courses in constitutional, administrative, and international law. Of these courses of instruction the following were given in the year 1882–3 for the first time: the course in the history of American finance, the course on public scientific surveys, the course on the economic development of mineral resources, the course on the historical development of educational systems and methods, the course on the government of cities, the course on the history of modern diplomacy, and the course on the methods of local government in Europe and America. During the year a "Political Science Association" was formed, consisting of professors and students, with the design of drawing together into more intimate and sympathetic intercourse all the members of the school. At these meetings papers resulting from original research were read by the President of the University, and by several of the professors and students of the school. Reports were also given at each meeting of books on political science, either recently published or recently procured for the University Library. The appliances of the school have been very largely increased during the past year by the purchase of nearly 2,000 volumes of books, which are now shelved in the rooms set apart for the use of students of the school. These books, taken in connection with the Rau Library of 4,000 volumes and 6,000 pamphlets on political economy, finance, and administrative methods, besides the works in the general library, are believed to offer excellent opportunities for the most advanced work.

—A few weeks since we recorded the formation of the American Ornithologists' Union. We have now to chronicle the organization of another scientific association, the Society of Naturalists of the Eastern United States, which held its first general meeting at the Columbia School of Mines, in this city, on December 27–28. Both in its scope and in its membership this young society departs widely from the customs of such associations in this country, for in both regards it maintains a strictly professional character. Its membership already includes the large majority of naturalists by profession in the Middle and New England States, among them many of great distinction. The communications made at the meeting all dealt with practical questions, such as methods of work and of teaching, museum administration, and other topics concerning the ways and means of naturalists. The attendance at the meeting was very large, and the proceedings most strikingly illustrated the advantages of having so many scientists interested in a single department gathered together, for the debates were often keen and pointed. Papers were read by Professors Wilder, Gage, Cope, Niles, James Hall, Harrison Allen, Wadsworth, Hyatt, Rothrock, Bickmore, and by Drs. Minot, Dimmock, etc. Only those papers were admitted which enlarged our knowledge of the *means and methods* of work, thus completely separating this society from all others where *results* of original investigation may be presented. The Society hopes to direct its powerful influence to elevating the character of the appointments of instructors in natural science in colleges and elsewhere. The abuses which occur in these appointments are too open and notorious to require to be here pointed out. It is not uncommon for a post to be filled in accordance with mere local knowledge of possible candidates, or for a competent person to be discarded or excluded through theological prejudice. The Society will confer a vast benefit upon the community if, as is hoped, it can exercise an effectual interference in these matters, on the one hand by holding up for condemnation bad appointments, and on the other by establishing a careful system of bringing competent candidates into direct communication with the appointing authorities.

—A year whose death-list includes, like that of 1883, names as eminent in their respective ranks as Chambord, Gortchakoff, Karl Marx, Wagner, Turgeneff, Colenso, and Doré, must be allowed a certain distinction among those which have preceded it. Some curious associations are noticeable: not only Doré, but his friend and comrade in Spain, Baron Davillier, the art archæologist and connoisseur; not only Clésinger, the sculptor, and son-in-law of George Sand, but Jules Sandeau, the novelist, and her lover; not only Ernst Dohm, the founder and editor of the *Kladderadatsch*, but Richard Doyle, the delightful caricaturist, and designer of the time-honored title-page of *Punch*. At the other extreme from Marx was Schultze-Delitzsch, the apostle of industrial coöperation; and from Colenso, Louis Veuillot, the Ultramontane editor of the *Univers*. Abd-el-Kader, who died more deaths by report in his latter years than he ever escaped on Algerian battle-fields, may serve as a sort of link between Louis Viardot, the historian of the Arabs and Moors in Spain, Edward FitzGerald, the lamented translator of Omer Khayyâm, and François Lenormant, the "all-round" Orientalist. The modern Greek statesman Coumoundouros, and Dindorf, the commentator and editor of the ancient Greek classical writers, left the stage together. So, likewise, Sir Edward Sabine, the veteran explorer of terrestrial magnetism, and Sir William Siemens, prematurely cut off in the midst of extraordinary electrical invention; so, again, John Payne Collier, the student of Shakspere, Karl Witte, a far higher order of mind, the student of Dante, and C. B. Cayley, author of the best metrical English version of the 'Commedia'. John Richard Green is certainly the most serious loss that history has sustained during the year, but Laboulaye and Henri Martin have, for personal and political reasons, a surer hold on remembrance. Science misses the Belgian physicist, Plateau; J. B. Listing, who gave his name to the familiar "law" in optics; and, more than either, Hermann Müller, in the domain of botany. Add the well-nigh centenarian S. Nilsson, "the oldest naturalist in the world, as respects both age and priority of his writings." From the service of art have been taken that interesting and serious French painter, Ulysse Butin, and Geefs, the Belgian sculptor. The composer Flotow leaves a name, but hardly a vacancy. Henri Conscience and Mayne Reid are chief among the novelists who have passed away. The vast unfinished ballad collection of Svend Grundtvig marks Denmark's privation. Another memorable scholar was Franz Dietrich, profound in Semitic and Teutonic philology. Bescherelle, author of the well-known French dictionary, is also gone. Sir George Bowyer, jurist; William Chambers, the people's publisher; Francis Bedford, not the people's binder; and the Rev. Derwent Coleridge, the amiable and learned son of the great poet, should be added to the Englishmen already enumerated. General Chanzy is the principal soldier whose obituary was written in 1883.

—The civil war is vividly recalled by the principal group in our domestic losses—Alexander H. Stephens, Vice-President of the Confederacy; Jeremiah S. Black, Buchanan's Attorney-General; Montgomery Blair, Lincoln's Postmaster-General; Senator Lot M. Morrill, member of the Peace (that was no peace) Convention of 1861; Senator Timothy O. Howe, a delegate to the Philadelphia "Loyalists' Convention" of 1866; Gov. Marshall Jewell, Grant's Postmaster-General; Gustavus V. Fox, Lincoln's efficient Assistant-Secretary of the Navy; and the gallant Generals A. A. Humphreys and E. O. C. Ord. Conspicuous also is the little band of munificent givers that includes Peter Cooper, Nathaniel Thayer, and Wm. E. Dodge. Dr. John Le Conte, our first authority in entomology, and Prof. Stephen Alexander, the Princeton astronomer, are the chief scientists on the list. The sculptors Clark Mills and Martin Millmore have left numerous monuments behind them. An individual if not a great novelist, the Rev. W. M. Baker; a clever poetical translator, the Rev. Charles T. Brooks; the historian of the Revolution, George W. Greene; Judge George Sharswood, the legal commentator; and Charles C. Hazewell, a prolific writer for the press, and a contributor to the encyclopædias (for which his historical studies especially qualified him), are

the leading names in literature whose work is closed. No more distinguished clergyman than the unhappy Archbishop Purcell calls for mention. We have reserved to the last a personage doubtless most world-famous of all our American dead—General Tom Thumb.

—Notwithstanding the important part which the cities of Holland have taken in the development of commerce and navigation, no history of Dutch maritime law worthy of its subject had been written before the work of Dr. M. Th. Goudsmit was published: 'Geschiedenis van het Nederlandsche Zeerecht.' It will consist of two volumes, the first, which appeared a few months ago, containing the history of the sources of Dutch maritime law, while the second will contain the history of the different doctrines. It is to be regretted that the Dutch language is so little known, for, apart from the value which this book has for the legal profession by reason of its thorough researches among the sources which are common to all maritime law, it gives the general public a glimpse of a very interesting and very little known part of the history of civilization—*Culturgeschichte*, to use a German expression. We refer to that part of the book where the author discusses the various "Keuren" which were promulgated in the Dutch cities on the subject of maritime law from the abjuration of Philip II. to the end of the eighteenth century. These "Keuren" were regulations of commerce which issued from the "Schepenen" (*i. e.*, the judges who had jurisdiction in admiralty matters), in cases as to which the customary law was silent, or which were fit subjects for police regulation. All the energy of the people was devoted to navigation and commerce, and it can readily be seen what interesting details of the social and political relations and of the every-day life of the Dutch people these "Keuren" reveal to us. They exhibit the jealous care with which the cities guarded against any encroachment on their municipal privileges by the central government in the struggle (in the regulation of insurance law) between practical good sense and old theological and moral scruples. But of no less interest, perhaps, for the student of men and manners are the paternal regulations to prevent sailors from getting drunk, or lawyers from interfering in any quarrel between the master and his crew. All these points, slight in themselves, but which give color and character to a treatise, are brought out in full relief by the admirable style of Dr. Goudsmit. The book, though entering into minute historical details, is eminently readable, and the full force of this compliment will be best understood by those who have tried wearily to plod through German books on similar topics.

— Although shorn of its honors as a product of the first printing-press, the so-called Gutenberg print, whose title to that distinction we think has been sufficiently disproved (see *Nation* of Nov. 29, 1883), is still not devoid of bibliographical interest. Late investigation has disclosed the probability of its being the *editio princeps* of Sebastian Brand's 'Richtlerlicher Clagspiegel,' published for the first time under the last title in 1516 at Strasbourg. The descent of Brand's popular compendium of law (for such is the character of the work) has been traced by Panzer, in his 'Annalen' from an anonymously printed and published tract, apparently a later edition of our newly discovered print, and typographically like a treatise printed by Peter Berger at Augsburg in 1488 or 1489, entitled 'Spiegel der menschlichen Behaltnuss.' Panzer credited Brand with the authorship of the precursors of the 'Richterlicher Clagspiegel,' but a proper interpretation of the passage in the title, reading "durch Doctorem Sebastianum Brand wider durchsichtiget und zum teyl gebessert," seems to show him only as the editor. Comparison of the Mentz (supposed Gutenberg) issue with the Augsburg publication shows the latter to be a word-for-word reproduction of the former, and the general coincidence in subject-matter with the 'Richterlicher Clagspiegel' indicates their common origin. The *Neuer Anzeiger*, still fondly imagining a Gutenberg incunabulum, cites the issuing of this popular law treatise as a further proof of Gutenberg's aim to disseminate useful knowledge, manifested already in the printing of the Bible to promote spiritual knowledge, in the 'Catholicon' for the presentation of scientific matter, and, finally, in the work under consideration to popularize legal information.

—Of books about books there is no end, seemingly, and especially in France, where the worship of paper and ink has been carried to the utmost excess. Among them a little book by M. Jules Richard, 'L'Art de former une Bibliothèque' (Paris: Rouveyre & Blond; New York: J. W. Bouton) deserves mention. It is a sort of supplement or corollary of M. Rouveyre's treatise on the 'Connaissances nécessaires à un Bibliophile,' which it matches in size and in typographic beauty. The paper is not too white, the margins are broad, and if the press-work had but been a little more careful, the book would be perfect. M. Richard's advice is meant not for those learned in books and full in pocket, but for the more modest beginner, who has a taste for reading and a liking for the prettinesses of printing, binding, and illustration. He warns the beginner against undue enthusiasm, and against the exorbitant prices asked for the original editions of second-rate authors. The great authors justify a long price and will probably hold their own always, but the second-rate owe their fancy prices only to freaks of the hour: Rétif de la Bretonne, for example, went up like a rocket and is beginning to come down like a stick; but the original editions of Molière's single plays have steadily risen in value until a full set is now worth about six thousand dollars (against which we may set the four or five thousand asked now for the first four folios of Shakspere). M. Richard notes that the Sand-Musset quarrel called forth seven books, 'Lui et Elle,' 'Elle et Lui,' 'Lui,' 'Eux et Elles,' etc., of which three are so rare that the collection was marked a hundred francs in a catalogue of 1876. He pays special attention to illustrated books; and here let us say in passing that in France nowadays an illustrated book is primarily a book adorned with etchings, just as in the United States it is a book adorned with woodcuts. There are a few fine French books illustrated by woodcuts as there are a few fine American books illustrated by etchings, but the French superiority in etching is as marked as the American superiority in woodcutting. The English superiority, so far as it exists, is in the fine color-printing we see in Mr. Caldecott's and Miss Greenaway's delightful books. M. Richard dwells on the need of a catalogue for even the smallest collection of books. He advises a card catalogue, but heretically suggests the separation of the author and subject-alphabets.

LORD LYTTON'S LIFE.

The Life, Letters, and Literary Remains of Edward Bulwer, Lord Lytton. By his son. With portraits and illustrations. Vol. I. (containing Vols. I. and II. of the English Edition). New York: Harper & Brothers.

THE instalment of Lord Lytton's life now before the public only brings his career down to 1829, when he was but twenty-six years of age. At that age, however, he had made his name as a man of letters—was known, in fact, all over the world as a poet and novelist. 'Pelham' had established his reputation on a secure basis, and he had also commenced a political career in Parliament. The picture of his early life, sketched by himself and completed by his son, does little to alter materially the impression made on the public mind by him while alive, as a man of extraordinary fertility, resource, and brilliancy of mind. That he had a great literary or moral message to deliver appears to have been one of his cherished illusions, and a tendency to illusion was one of his marked characteristics. Both he and his son have a good deal to say about the moral purpose of such books as 'Falkland' and 'Paul Clifford.' The first, as we understand it, was to portray the disastrous consequences of illicit passion; the second, to utter a protest against the bloody penal code of the day. But, unfortunately, even in such cases, the purpose of the author does not seem to have been understood. Curiously enough, he appears at one time to have thought of himself as heading a reaction against the "satanic" school brought in by Byron—the school of morbid melancholy, self-accused of unnamable crime. We say curiously, for he himself fell heir to a good deal of Byronism—to its melancholy, to its sensitiveness, its magniloquence, its pride; and he was hailed in France as a great literary man on the strength of a resemblance which was, perhaps, more striking when perceived through the medium of a translation into a language that easily lends itself to magniloquence, than in English. But, looking back at the long array of books of all sorts that he produced, it is hard to detect in any of them the touch of original genius that marks the work of some of his contemporaries with whom he inevitably must be compared.

He began his career at a period when it was in fashion to be "misunderstood," and it would appear, from his own and his son's account, that he was thoroughly misunderstood to an extraordinary degree. Not only many of his critics and most of his readers misunderstood him, but in private life he was wholly misunderstood by his mother and by his wife. In connection with this fact, we may refer the reader to the Lady Caroline Lamb episode. She, being herself a thoroughgoing *femme incomprise*, brought a promising flirtation with the young author to an untimely end. His account of her relations with him throws out into bold relief the more ridiculous features of the society in which he was brought up, and makes us wonder how in such an atmosphere any manly or healthy feeling could flourish. It was a society in which the sentiment and fancy were cultivated to the point at which it became continually impossible to tell whether what you felt was a simple emotion, or the result of a strong imaginative perception of what the emotion appropriate to the situation would, to the eye of Romance, probably be.

A great part of the present volume is taken up with an account of the estrangement and subsequent partial reconciliation between Bulwer and his mother, and the circumstances of his married life which led later on to the fatal trouble between himself and his wife. For his biographer the task of going over this ground is certainly an unenviable one, and if he accomplishes it without provoking replies and recriminations from the custodians of other literary remains, his book will be more successful than such publications are apt to be. The

sum and substance of his story is this: Bulwer's mother (between whom and his father there had also been a separation) had, before his marriage to the beautiful Miss Wheeler, supported him. To this marriage she was bitterly opposed, and her son promised not to marry without her consent. Before long, however, he began, as might have been expected, to feel that his honor was involved by his relations with Miss Wheeler, and that therefore the promise ought not to be considered binding. His mother regarded it as sacred, and on his marriage stopped his allowance, as she had threatened to do, and absolutely dropped him. Then followed a series of letters from Bulwer to her, which give us an important clue to his character. Their writer was certainly in a very cruel position. Himself accustomed to an easy life, on a liberal allowance furnished by his mother, he had now married a woman unaccustomed to privation or care, and, by her own naïf admission, unqualified for the common routine of household duty. Income he practically had none, and he had nothing to look forward to but literary drudgery as a means of livelihood. Yet in all his letters to his mother, pleading earnestly for a reconciliation, on every ground that occurred to his heart or mind, there is not a suggestion of any pecuniary claim upon her. He appealed to her to be reconciled to his wife as a matter of justice, and his appeals proved too eloquent to be resisted; but the letters are those of a man too proud to admit that a question of money should affect such a matter—though he must have been sadly in need of it at the time. Finally the reconciliation was effected, and his mother called upon his wife and restored his allowance. She was, however, not satisfied with her reception, and in consequence used some expression about her "maintaining" her daughter-in-law. Bulwer at once declined to receive the allowance, and wrote his mother a letter beginning as follows:

"HATFIELD: Thursday.

"When, some time ago, you informed me of your intention to allow me so large an income, I was perfectly aware of the great generosity of the offer. Nothing could have induced me to agree to your making so considerable a sacrifice but the conviction that, as the proposal could only arise from affection, so I could not more wound that affection than by refusing it. I felt, too, that my health was weak and reduced; that it had been greatly overstrained, that it required a long and considerable relaxation from mental harassment for its recovery; that, without your proposal, I should not be justified in giving myself such relaxation; and that, as you were so sensible of this that your offer seemed, in great measure, to spring from the knowledge of it, so it would give you, I thought, a far greater pleasure to relieve me from the necessity of exertions which had become injurious, than to be withheld by me from a sacrifice for which nothing could repay you but my sense of its exceeding generosity and kindness. To have refused it at that moment would have been false pride. I accepted it with the warmest gratitude, and it was a pleasure to me to think I owed you so much."

But, he adds, he did not consider this, nor did he suppose that his mother considered it, "maintenance." For three years already he had been maintaining himself. The effect of the allowance (£1,000) would be merely to enable him to work less hard and spare his health, on which his constant labor was beginning to tell. He says that he is "not above an obligation," but insists very justly that in such an obligation, the moment the kindness and generosity of the benefactor are subordinated to the sense of pecuniary burden, the latter becomes intolerable. He continues:

"What remains to me to do is obvious. I feel still persuaded that, at the time you made to me so generous a proposal, you did not see the offer as, according to your words, you now see it; and I shall always remember the affection which then dictated it with a gratitude much warmer, I fear, than I should have felt for it had you said those words some years hence, after I had incurred the *unconscious* meanness of contracting a debt I had not the ability to pay.

"Firmly, then, and respectfully, I now return to my own resources and my own exertions. The sum you were so kind as to transfer to my account will have been paid back to yours before you receive this letter. The feelings that occasion this decision do not lessen my affection. They only render me, I hope, more worthy of yours. *Maintenance* is a word confined solely to *Charity;* and no person who retains the use of his limbs and brains deserves esteem if he stoops to receive charity for himself. Still less does he deserve it if he suffers his wife or children to be dependent on the charity of others."

This is certainly the letter of a morbidly proud young man, but there is in it a tone of lofty superiority to what may be called the modern business view of family relations which is characteristic of Bulwer. We may call it absurdly romantic, but Bulwer was brought up under the influence of the idea that romance was the great reality of life, and for his over sensitive mind romance proved to be too strong meat. But if any one who recollects the effect upon himself when young of Bulwer's novels—and it is chiefly upon the young that such books are likely to have a strong moral effect—will candidly recall the impression they made, he will certainly admit that magniloquent or affected though they may have been, they never taught him to take a sordid view of life. It was left for a later generation of novelists to depict life and fate as hinging on pounds, shillings, and pence.

Bulwer's autobiography is a fantastic sketch of a high-strung, enthusiastic, romantic boy, brought up among books, and aristocratic traditions and prejudices, and belonging to the old pre-democratic world, when it was the fashion for gentlemen to profess radical ideas, the ultimate consequences of which they little perceived. In 'Pelham,' in 'Kenelm Chillingly,' in 'Ernest Maltravers,' we catch glimpses of him, but in reading his reminiscences, we feel ourselves in an atmosphere as far removed from that of ordinary biography as was the ether breathed by those heroes. Whatever we may think of his poetry, there is no denying that he had the poetical temperament, and saw events and persons in a light which never was on sea or land, and which he seemed to have the power of turning on at will; for when not giving himself up to flights of fancy, his observation of the actual facts of life, and his judgment of the motives which govern men in their intercourse with each other, were shrewd and just.

Thackeray, who later in life apologized with becoming contrition for the fun he had made of him, wrote a parody which perhaps constitutes the best extant criticism of Bulwer's literary faults, and of the curious vein of absurdity that makes his efforts at romance so frequently end in a fiasco. He never understood (for he had none of that rare humor which enables a man to enjoy a joke at his own expense, and indeed very little humor of any kind) what people found to amuse them in the lampoons upon him with which the press soon began to abound; and when we remember the grossly personal character of much of the literary criticism of the day, we can hardly wonder at his assumed indifference to the "ribald" attacks of his enemies. His son gives a specimen of these from *Frazer's* of December, 1831, and it is certainly of a kind to make us stare.

"Do not be seduced," the writer says, "into the belief that, because a man in your employer's back shop can manufacture a novel on the shortest notice, and at the lowest price, therefore all other species of literary labor may be similarly performed. Nobody knows better than yourself that to make a fashionable novel all that is required is a tolerable acquaintance with footmen and butlers. This will supply the high life. The meanness of the characters introduced you may draw from yourself. . . . Wishing to put a young man in your position in the right path, I have cast a hasty glance over the first magazine on which you have tried your hand, and am sorry to say it is truly beastly, and abominably stupid. . . . My dear Bulwer, this writing of yours is bitter bad, it is jejune base twaddle, twaddle, I say, Bulwer, twaddle."

This was pretty wide of the mark; but Thackeray's satire was a nearly mortal stab. To Thackeray Bulwer was simply keeping up a sham romance in literature; his flights of fancy were affected and fantastic, his sentiment unnatural. And so they often were. Thackeray was right: 'George de Barnwell' is a wonderful parody. But this was not all. The strangest part of Bulwer's life is that the true is mixed with the false so that they are inseparable; for his overheated imagination often did not permit him to know which was which. He was no conscious literary impostor, as Disraeli must have been, but a man who was fond of looking at the world in the light of sentiments and ideas which had little or no relation to experience, while his life of constant literary drudgery was making him one of the most expert, shrewd, and practical men of letters of his day. The construction of his novels alone—the sustained interest in the plot, the witty observation of men and manners, and the extraordinary range of reflection and study shown in them—would make his career remarkable. As a dramatist, he has accomplished the feat of producing plays which have held the stage for a generation—a performance in itself enough to make his literary career remarkable. His many good and strong qualities—his industry, his research, his insight into motives—triumphed in the end over the influence of the artificial social and literary atmosphere in which he was brought up, and leave his name still famous in the long list of great authors our age has produced. No one can read the record of his steady, unremitting, and painful toil, to which he devoted his early and best years, without feeling that all he won he honestly earned.

WALLACE'S EGYPT.

Egypt and the Egyptian Question. By D. Mackenzie Wallace. London and New York: Macmillan & Co. 1883.

THE *muzsik*, or little man, is the most prominent subject in Wallace's 'Russia'; the *fellah*, or peasant, is the almost exclusive subject of his 'Egypt.' Neither book is a work of travel, or of geographical interest; the former is an ethnographical study in a very broad sense, the latter an economico-political study of very limited scope. 'Russia,' being the result of a young man's observations, for several years during a peaceful period, on a nation awakening to self-consciousness in apparently youthful vigor, is no less pleasantly readable than it is instructive; 'Egypt,' the product of a much-disillusioned observer, bent on examining inveterate national ailings, wounds inflicted by recent governmental quackery and sudden convulsions, and general conditions of decrepitude, is naturally very painful reading. In spite of the author's easy and lucid way of narrating experiences personally made or gathered from witnesses, of his good-natured humor and perhaps too constant facetiousness, of his invariably pleasing style and rich stock of comparisons and illustrations—whence also no little diffuseness and repetition—this volume reads like a martyrology which inspires pity totally unmixed with admiration. Heartless tyranny on

one side, and stupidity and cowardice on the other—such is all the picture of woe exhibited before us. Not a ray of Pharaonic, Ptolemaic, or Saracenic glory is reflected upon it. The author discards all the allurements so easily borrowed from Egyptian lore and history, ignoring alike Amen-Ra and Thebes, obelisks and hieroglyphs, Hyksos and exodus, Cleopatra and Cæsar, Amru and Saladin. He treats Egypt and the Egyptian question as topics of political pathology, interesting to statesmen, and now, exceptionally, also to the whole British nation. Aiming at being seriously exhaustive and at making his problem popularly intelligible, he has succeeded in both—though not without exposing himself, as he is well aware, to the reproach of analytical tediousness on one side, and of levity of diction on the other.

His story and view of the situation may be epitomized as follows: Mehemet Ali, in the beginning of this century, replaced the chronic disorder which prevailed under the divided and petty tyranny of the Mamelukes by a strong and enlightened personal despotism. Having crushed the Mameluke beys, he did all in his power to develop the resources of the country and introduce European improvements. His great economical work was the systematic canalization of the delta. This required an enormous amount of forced labor, which was pitilessly extorted from the fellahs. It wonderfully increased the productivity of Egypt, but the despot, whose aim was not the welfare of the people, but the accumulation of means for one day coping with the Sultan, took good care that the increase in the national revenue should mainly flow into the Viceregal treasury. This he effected by rigid Government monopolies. He guarded for himself the exclusive right of buying agricultural products for exportation, and his Government fixed the prices. When forced by the Sultan to submit to the general treaties of the Empire, which allowed foreigners to trade freely with the natives, he made this right nugatory by extorting heavy taxes in kind, and leaving but a scanty surplus to the producers. A still more galling burden was his military conscription. After the extermination of the Mamelukes he resolved on getting rid of his Albanian soldiery through the formation of a native army, and it was composed mainly of fellahs violently torn from their homes. The peasantry had gained some security and a greater fixity of land tenure under the intelligent sway of Mehemet Ali, but they felt the weight of his imposts, forced labor, and conscription to be as grievous as the fitful rapacity of the Circassian robbers whom he had annihilated. The short reign, in 1848, of his son (or adopted son) Ibrahim Pasha, who had commanded his armies in Arabia, in the Morea, and in his wars with the Sultan, was but a continuation of the same régime.

Under Ibrahim's nephew and successor, Abbas, the fellahs breathed more freely. Abbas was addicted to private vices, and was haughty in his demeanor, gloomy and fierce; but he was free from Mehemet Ali's towering ambition, designs of conquest, and love of military display. His fiscal rapacity was therefore more moderate, and the burden of his conscription light. He abolished what remained of the Government monopolies, and diminished the *corvée* duties; for the ordinary resources of the country more than sufficed for the wants of his peaceful administration and the satisfaction of his luxurious tastes, while the continuation on a grand scale of Mehemet Ali's canalization schemes was deemed unnecessary. The kurbash was sparingly used in the collection of taxes, and yet the Viceregal treasury was full. The habitual victims of Abbas's tyranny were persons far above the state of the fellah, and by such he was, in 1854, strangled in the recesses of his harem.

Said Pasha, Mehemet Ali's son, who succeeded Abbas, was entirely different in character. Kind-hearted, light-headed, amiable, he had more of the witty Frenchman than of the grave Oriental. But he had weaknesses which became sources of oppression. He had a love of soldiering, used the army as a plaything, and consequently extended the conscription. He was unable to resist the suggestions and requests of unscrupulous European adventurers—"that swarm of *chevaliers d'industrie* and shady financiers who were soon to help on the Viceregal Government in its downward course through pressing financial embarrassments to national bankruptcy." Said was also unable to resist the loftier suggestions of a man of different stamp—Ferdinand de Lesseps—and, after much vacillation, he signed the concession for the construction of the Suez Canal. This signature was of vital importance to the commerce of the world—and also to the fellahs. M. de Lesseps "no doubt really intended, as he said, to teach—not by precept but by example—the native Egyptian engineers how to dig and clean canals by machinery, without the use of forced labor; but somehow, when the work began, . . . he thought it better to teach his French engineers—not by precept but by example—how to dig and clean canals by forced labor, without machinery." The consequence of this change of method for the Egyptian peasants was that there were always about "20,000 of them at work, 10,000 in the course of being transported to the scene of operations, and 10,000—or as many of these as had survived the labor and privations—being transported back to their homes." Apart from the vastness of the scheme, the "ruthless sacrifice of human life . . . entitles the canal to rank with some of the great works of the Pharaohs." Fortunately, Lord Palmerston—not from purely humanitarian motives—obtained the annulment of the forced-labor clause; and Said's increased taxes, too, were not unbearable, owing to the rise in the price of grain caused by the Crimean war, to the greater facilities of exportation created by the completion of the railway from Alexandria to Cairo, and ultimately to the unprecedented demand for cotton produced by the American civil war.

Ismail Pasha, Ibrahim's son, who succeeded Said in 1863, "combined in his portly person the qualities of a vigorous Oriental despot with those of a daring Occidental stock-broker," and his schemes for developing the immense resources of Egypt were on a grand scale. Fortune favored his ambition. The American war at its height, the clamors for cotton of the spinners of Lancashire, and the hoarded wealth of Western Europe anxiously seeking new fields for investment—these were admirable circumstances for a financier enthroned in Egypt. Ismail threw the flood-gates wide open to European capital, and its effects were magical. Railways, canals, and harbors were created, extended, or improved. The cotton production was wonderfully stimulated and increased; ginning factories were established. The pashas and large land-owners imitated the work of their ruler in his boundless estates, and the peasants themselves eagerly took to the new species of cultivation. A most extraordinary prosperity rewarded the new enterprises; gold flowed into hovels. But the fellah's Golden Age did not last long; when the American war was over, the bubble of inflated production burst. Egyptian cotton was "played out." The soil showed signs of exhaustion. But the increased taxes remained. The Khedive needed money, and the bastinado had to squeeze it out of his impoverished subjects. Worse than that—sugar production was now to be a substitute for cotton in gorging his treasury. Upper Egypt was to produce it, and had to be canalized for the purpose. And so the Ibrahimieh Canal, from Bibeh to Assiut, was dug by forced labor. And, to complete the improvement, the Upper Egypt Railway was built alongside the canal and brought down to Cairo—also by forced labor. The poorer peasants were besides in debt for loans contracted for land improvement; they borrowed from Greek usurers to pay arrears of taxes; unable to pay, they sold their land, or the Government confiscated it—that is to say, Ismail did; and he thus ultimately became the owner of about one-fifth of all the arable soil of the country. All the enormous machinery of the Government, from the Minister of State down to the lowest village sheikh, was constantly active in this great work of oppression and extortion; and each worker had his special compensation, wrung from the fellah.

But a day of reckoning is inevitable. "The Egyptian Viceregal magician has made a solemn contract, and has often renewed it, with the demon of European finance, and the financial Mephistopheles has served him faithfully according to the terms agreed upon. He has created for him railways and canals, opera-houses and ballet-girls, cotton-plantations and sugar-factories, palaces and public gardens, harbors and iron-clads—in a word, everything that a fertile Oriental imagination could devise—and now, . . . the *mauvais quart d'heure* approaches, when the last clause of the contract has to be executed." The magnificence displayed at the opening of the Suez Canal has not restored his tottering credit. In his distress he applies to the European Powers for controlling financiers, and receives successively Mr. Cave, Signor Scialoja, Goschen, and Joubert. They are no magicians. His fertile brain looks for a more potent spell to conjure the approaching doom: he invents a sham parliamentary government, and telegraphs to Paris for Nubar Pasha to form a responsible cabinet. Nubar arrives, but, instead of aiding in a work of jugglery intended to remove the fiscal responsibility of the Khedive, he is fully in earnest about the reforms, and frightens his master with the spectre of deposition into giving up to the state his and his children's private estates, and accepting the financial management of Mr. Rivers Wilson and M. de Blignières. Ismail cannot brook it long. He rids himself of the incubus through a military demonstration, and announces a new scheme of financial settlement, with a great display of patriotic readiness on the part of his family to sacrifice wealth to the honor of the state. It is too late. A grudge of Germany, the old jealousy of the Sultan, and the anger of France and England at the dismissal of Wilson and Bligniéres result, in 1879, in the launching in Stambul of the imperial decree of deposition, and there is no means of resisting it. "Exit Ismail with an air of injured innocence, and with a carpet-bag containing valuable family jewels. . . . Enter Tewfik, accompanied by Riaz and the Anglo-French control"; and with the latter come an overhauling of the finances, economy, a better distribution of taxes, and an improved method of collection. The rise and agitation of the National Party, Arabi's insurrection and dictatorship, the massacres of Alexandria and its bombardment, and Tell el-Kebir, caused new confusion, and entailed new losses and sufferings upon the fellahs who were beguiled or driven into the patriotic movement.

Of the men who under Ismail and his son, Tewfik, acted an important part in politics, Nubar, Riaz, and Arabi are the most conspic-

uous. Nubar, an Armenian by descent, combines with the knowledge and enlightenment of first-rate European statesmen the suppleness and subtlety, the rapidity of conception and fertility of resource, of the genuine Oriental, and "a charm of manner, an artistic power of lucid explanation and graphic description peculiarly his own." A sincere friend of legality, it was he who, though averse to the political domination of the foreigners, introduced the International Law Courts, and, systematically undermining the arbitrary power of Ismail, greatly contributed to his fall. Riaz, the son of a Jewish renegade, or himself a renegade, is a small, thin man, of anything but prepossessing appearance, and endowed neither with the Oriental's dignity of manner nor with a natural fluency of speech. But he is possessed of a strong will and great tenacity of purpose, and, what is much rarer in the atmosphere in which he acts, of integrity in pecuniary matters. As an administrator he has great natural aptitude, ample experience, and energy; but, his ways being those of the Oriental rather than the European dignitary, he has always evinced more faith in discipline than in justice, and greater anxiety to uphold the authority of the guardians of order and collectors of taxes than to redress grievances. He is patriotically jealous of foreign influence, and convinced that Occidental institutions in Oriental lands can result only in confusion and anarchy; but he honestly assisted the English and French financiers, as such, during the time of the dual control. Arabi is a big, broad-shouldered fellah, with a massive forehead, soft eyes, "an indefinable something which impresses favorably all who come in contact with him," and wonderful eloquence in the language of the Koran. Of his movement, and the view taken of it in England, Mr. Wallace says:

"Again and again our responsible statesmen expressly declared, or tacitly assumed, that Arabi was simply a military adventurer and nothing more; that the military leaders represented no one but themselves, and produced a mere phantom of popular support by terrorizing the population; that the real National Party, in so far as anything of the sort existed, were represented by the virtuous Sherif, and had no manner of sympathy with Arabi and his wicked accomplices; that all sections of the population were animated with loyalty and affection for the amiable young prince who was their legal ruler. . . .

"Now, I do not wish to inquire who are responsible for this absurd caricature of the revolutionary movement. . . . But in the name of common honesty and common sense, let us frankly abjure our errors, let us refrain from increasing our difficulties by adopting the silly device of timid, stupid ostriches, and let us look the facts bravely in the face, however ugly or unpleasant they may be. Arabi did not acquire and preserve his influence by terrorism, for at the commencement he had no power to injure any one, and during the whole time of his power he never caused a single individual to be beheaded, hanged, or shot. If he had gone to the poll with Tewfik, and all corrupt practices had been excluded, he would have obtained the votes of an overwhelming majority of the free and independent electors. The amiable young prince never possessed the faculty of inspiring his subjects with affection or enthusiasm, and he became decidedly unpopular when he sided with the foreigner against Arabi. The virtuous Sherif represented merely his own views, and those of a few respectable moderate men, who might be counted perhaps on the fingers of one hand. Nearly everybody in Egypt, intelligent and educated enough to understand what the question at issue was, wished to be freed, not from the tyranny of military despots, but from the wholesome checks created by the Anglo-French control, while the great mass of the ignorant peasantry wished to be liberated from the yoke of the usurers, which was the only kind of foreign influence with which they were personally acquainted. . . ."

Those who remained really loyal to Tewfik favored a strong government through a trustworthy army of foreign mercenaries, but very few were ready to help in carrying out the English reform scheme; and to suppose that these few can realize that scheme by their own strength and without extraneous assistance is as absurd, Mr. Wallace thinks, "as it would be to suppose that two men and a boy in a little dinghy could tow the *Great Eastern* out to sea." English coöperation in the work of reorganizing Egypt must, therefore, not be confined to merely removing obstacles: England must have the direction of the work. She must prevent dangerous political agitations by removing, as far as possible, legitimate grounds of complaint. But the political institutions to which her influence may give rise must be created for advice and guidance rather than for a direct exercise of power. The Khedive and his ministers must be endowed with sufficient power, and induced by the necessary amount of pressure, to carry through the needed reforms. The action must virtually be England's. The great majority of the native officials have no wish for reforms tending to diminish their illicit gains or curb their despotic sway. The few who have a purer character and higher aims are incompetent from lack of knowledge, faith, or energy. The great mass of the people are ignorant, apathetic, and helpless. Improvements in the Egyptian administration must be of the Indian type. "They must be imported, and for some time carefully tended. When they have once struck deep root, they may, perhaps, be left to take care of themselves." The improvements are not to be merely political; economical ones are more urgently needed. For Egypt is threatened with a terrible economic crisis, the rural population being impoverished and sinking deeper and deeper into debt and arrears of taxes, while the soil is losing its fertility. And England has no right to shrink from the difficulties of the task, enormous though they be. She may have had no right to go to Egypt, but she has now the duty to stay there until she performs what she undertook to do. On this point, which is, in fact, the main practical point of the book, Mr. Wallace expatiates most emphatically; but we have room left for only a few of his remarks:

"If we were not resolved to create something like permanent order in Egypt, why did we go to Egypt at all? If we did not mean to create really good government, why did we destroy the National Party, which had a far better chance of preserving order of some kind than the Khedive whom we reinstated? If we intended to let the Egyptians stew in their own juice, why did we wantonly interfere in the operation and send the fat into the fire? If we did not mean to do something serious in Egypt, why did we heedlessly and needlessly offend France by abolishing the Dual Control? The time for considering the question as to whether we should undertake the work of Egyptian reorganization was in the early part of last year, before we overthrew the Arabi dictatorship, and before the destruction of Alexandria. It is rather late in the day now to have conscientious scruples, and very foolish to imagine that by shirking our duties and responsibilities we can make for ourselves a reputation of disinterestedness and generosity. The man who begins to have conscientious scruples after having accomplished the destructive part of a great work, and who timidly shrinks from the unquestionable difficulties and possible dangers in the constructive part, does not gain a high moral reputation, but gains, and gains justly, the reputation of a miserable, canting coward. We have done the work of destruction in Egypt very thoroughly. I do not speak merely of the blackened ruins of Alexandria. . . . We have thoroughly destroyed the old despotic system of ruling the country, and have thoroughly dislocated the whole system of government. . . . We prevented the Khedive from getting rid of Arabi at the commencement. Next, when the National Party were victorious, we prevented Arabi from getting rid of the Khedive; and, lastly, when the Khedive was reëstablished, we prevented him . . . from recovering his moral authority and prestige by the exercise of what he, and all impartial Egyptians, regarded as an act of necessary severity. . . ."

Historical Handbook of Italian Sculpture. By Charles C. Perkins, Corresponding Member of the French Institute, Author of 'Tuscan Sculptors,' etc. New York: Charles Scribner's Sons.

THE position of Mr. Perkins as a recognized authority on Italian art is such as to render superfluous any elaborate notice of a work which in part retraces the ground travelled over in former works. At the same time, the classical importance, and the unquestionable high value of what he has to say on Italian art, leave the publishers no excuse for the poor and cheap manner in which the book is brought out. The illustrations are not over-copious (though excellent in their way) for a work of its kind, but they lose much by the quality of the paper and press-work. The brief preface contains more matter than one usually finds in such documents nowadays, when authors apparently regard them as mere formalities—rudimentary indications of functions now foregone. The curious fact of the gradual decline of art under the influence of a religion which has received the credit of being its foster mother, is interestingly shown. The conclusion is not new, but Mr. Perkins states it more logically than we have seen it elsewhere:

"Varying between Byzantinism, which regulated all forms of art by strictly conventional rules, and Mediævalism, which regarded them solely as a means of conveying doctrinal instruction through symbolic or direct representation, sculpture in Italy had dragged out a feeble existence for many centuries before the year 1000 (when the end of the world was confidently expected), and had then almost ceased to be. As the dreaded moment approached, men only thought of how they could save their souls or drown their anxieties, and not until it had passed did they breathe freely enough to occupy themselves with life and its activities."

But when, following this lead, the author says that "among these, art at once claimed their attention, as gratitude for deliverance found natural expression in the building of new churches, etc.," we should be inclined to question his theory of cause and effect. That the failure of fulfilment of the churchmen's prophecy to a certain extent weakened their influence, and threw men back on the material life, and so emancipated them from the influence of the terrors which the Church held over mankind as the inducements to an ascetic life, is more probable than that any sense of gratitude for having escaped the menace which was a part of the religious discipline, should have made them more religious. It is hardly likely that they should overflow with thanksgiving for heaven's not having visited them with a doom which they were accustomed to regard as a part of the divine plan, and whose failure emptied the thunders of the Church. Men inclined to art because they felt freer and happier with regard to the material existence; but as in their condition of social organization the Church still held a powerful influence over their mental tendencies, they expressed their artistic aspirations in the way which sympathized most with the dominant mood of society.

The distinction the author makes in his account of sculpture as to its character is good; "we use the word *sculpture, which implies technical and æsthetic training*, instead of *stone carving*, which more properly expresses the nature of much of the work which we are to consider, simply because it is a more convenient form of speech, and not as implying artistic excellence in Italian works of the eleventh and twelfth centuries"; and this might be applied, *mutatis mutandis*, to painting as well. A well-digested introduc-

tion treats of the condition of sculpture prior to the epoch of Niccola Pisano, whom the author rightly regards as the head of the movement of renaissance of sculpture, and with whom the history proper begins. Says Mr. Perkins: "For our own part we have no hesitation in leaving this long-accredited honor (that of giving birth to this revival) to Tuscany, for only there are to be found those works of the twelfth century which announce its approach, together with those of the thirteenth in which it reveals itself"; and here we can but agree with him entirely, the more as at no time has the southern portion of Italy, including Rome, shown originality or priority in artistic development. Nor is it possible that any such revival should take place where a general artistic tendency did not exist in the people, any more than that one man even like Niccola should, without a preparation such as existed only in Tuscany, where it was probably the inheritance of the old Etruscan blood, evolve by his personal influence a reformation or revival of art.

In reference to Niccola, Mr. Perkins makes one remark to which we should except as a matter of general philosophy of art:

"It seems at first sight strange that an artist of such extraordinary genius as Niccola Pisano should not have formed scholars content to repeat his types and work in his spirit; but we understand the reason when we look at the eclectic character of his work, and consider the unsettled state of men's minds about art at this time. To shape others, a man must himself have definite ideas, and these Niccola had not."

Unless *definite* ideas mean limited ideas, we should be inclined to maintain that Niccola had all the definiteness which we can expect of a man who absorbs and remodels the ideas of all around and before him, and that his eclecticism was that of which we have such a near and remarkable example in Turner, who worked in the vein of many artists whom he appreciated, and at one time was eclectic and then intensely individual, without ever losing what he had absorbed. That an artist should make imitators, it is necessary not only that he should be strong and definite, but that he should be limited; a man of large and catholic genius will form pupils without moulding them to any narrow resemblance to himself. They may not "be content to repeat his types," simply because his types are not final, but be willing to follow his spirit and show in their works his influence, and thereby, in their development, the wider nature of their master, working in a liberty which he taught them.

The book closes with the year 1600, when in truth Italian sculpture may be said to have reverted to "stone carving." A useful appendix is the index to towns containing the works of the various masters, in which some changes are already to be made, as works formerly in positions more or less exposed are being transferred to the museums. The renaissance of sculpture in Italy is every day more clearly seen to be the school of our modern sculpture, if we are to have any, and the works which treat of it in its various relations are becoming a very important element in our art literature. In its province, we know nothing which so well fills its niche as this work.

A Roundabout Journey. By Charles Dudley Warner. Boston: Houghton, Mifflin & Co. 1884.

MR. WARNER is one of the pleasantest of companions in those travels that are made by one's fireside. The ordinary inconveniences of rapid transit through semi-civilized lands, or through those half-barbarized by tourists and their tormentors, seem to disappear from his path; the sun always shines, the world wears a leisurely look, and only so much of the inevitable occurs as may be easily accepted as food for humor. In this volume, which relates the adventures and describes the varying landscape to be met with in a journey round the western coast of the Mediterranean, there is the vividness, the picturesqueness, and the impression of a pervading indolence, familiar to us in the earlier books of Oriental travels from the same pen; and there is that light cheerfulness and tolerance which give the most agreeable *politesse* to a traveller, at least up to that evil hour when he entered Spain.

The ground gone over is the south coast of France, Sicily, Malta, some few miles of the Morocco shore near Tangier, and Spain. Roses bloomed from the start, and here and there some fine old legend of the romantic mediæval Mediterranean, the sea of the Norman, the Saracen, and the Crusader, gave itself to the traveller's hand. At Palermo he visited that curious cemetery that looks like an emigrant's baggage room, where 8,000 of the wealthy are exposed in death, their dried and weazened corpses, decked with crowns and lilies, kid gloves, fine shoes, and the like, being piled up in boxes with glass doors, or hung by the neck from the ceiling in all the ghastly grimace and what Mr. Warner calls the "limpness of irresponsibility for appearance which characterizes the dead." There probably is not on earth another so grotesque sight on the grand scale. It makes one think of the Sicilian vespers, the Pompeian museums—what not of the fierce extremes of a southern nature? But for the most part only delightful scenes rose along the way; the most charming of which seem to have been Taormina and Tangier, whence an idle man need never wish to stray; or such localities as were most colored by the neighborhood of the Orient. For anything Oriental, whether in costume or manner or habits of life, Mr. Warner has a soft spot in his heart. Though he may not approve, he is plainly attracted, and he turns away from the calm, the passion, the broad glowing colors of the scene even, with the air of one who likes the lotus, but has a practical fear that it will disagree with him.

The proverbial end to all good things came when Mr. Warner took the discommoding steamer for Spain. From the hour he entered and had difficulty in retaining a single hairbrush from his baggage for the necessities of his morning toilet, he was badgered with incivility and harassed by a growing dislike for Spanish food, particularly beans. He holds the cuisine of the country in disdain; and his humor, whenever he mentions it, would be pathetic were it not a trifle acrid. Listen to this:

"Our repast was all we could expect. The person who is fond of tasteless beans will find Spain a paradise. In this land of olives, those served on the table are bitter and disagreeable, and the oil, in which everything is cooked, is uniformly rancid. But it should be confessed the oil is better than the butter, when the latter luxury is attainable. Something seems to be the matter with the cows. I do not wonder that the Spaniards are at table a temperate and abstemious race. It is no merit to be abstemious with such food and cooking. The wine at Arcos, however, was a sort of manzanilla, that made us regard any food with favor. It was a medicinal draught, with a very strong flavor of camomile—a very useful root, I believe, in the manipulation of the market sherry, and exceedingly wholesome. So long as a man can drink this wine, he will not die. I should recommend the total abstinence society to introduce it into our country."

So he goes on, finding Spain a larger Arcos, except when he meets with some of the Moorish art or romance, which serves as a foil to degrade the present possessors of the land still more. They do not, it appears, even court their ladies with guitars. Courtship in Spain was like everything else—it struck no responsive chord in Mr. Warner's heart:

"The attitude of a lover in Spain is to stand motionless, hour after hour, at a heavily-grated window. We saw one slim gallant in the position, when we set out on our walk, and an hour after he maintained the same impassioned, patient embrace of the iron grating. It would seem to be a safe sort of courtship, and as intoxicating as talking with a nun through the grille of her cell."

Naturally, when he got out of Spain, Mr. Warner felt that he had got into paradise. But, clever as the sketches are, plainly as the scene is brought out—a European New Mexico, treeless, mountainous, dry, a land of torrents, and precipitous paths, and white shining cities, and burning skies; convincing as the proof is that the difference between the Spaniard and the literary idea of him is astonishingly great and disappointing, nevertheless we cannot but believe that "something was the matter" with Mr. Warner as well as with the Spanish cows, and that a slight change in the organism (unscientific as it would be) might have modified the environment. After all, it is not Spain present, but Spain past, that one wishes to hear about, and it takes an imaginative rather than a realistic observer to tell us the thing of interest. Whatever be the reason of our distrust of the comprehensiveness of Mr. Warner's story, no one will go to Spain on his recommendation. He concludes his work with an account of the Bayreuth "Parsifal," which seems to have got lost from some other volume and has unexpectedly turned up here, where it has no place.

Etymologisches Wörterbuch der deutschen Sprache. Von Dr. F. Kluge. Strassburg: Trübner. 1882–83. Pp. 428. (10.50 marks).

THE introduction to this dictionary contains a brief history of the language. At the end are lists of the Greek, Latin, Italian, French, and English words mentioned in the work. The author accomplishes for German what Skeat attempted to do for English. He gives us a dictionary written according to the soundest scientific methods now recognized, and, after a critical sifting of what is settled and still to be settled, he embodies in his work the results of the investigations of the last fifteen or twenty years. Weigand was growing antiquated very fast, and, in fact, never seriously pretended to give us any connection between old or modern German and Indo-European philology. Skeat, though more ambitious, is not able to go back of Fick and Curtius, who belong to the old school of etymologists, though far in advance of Pott, Benfey, Diefenbach, and others. In fact, as Sweet has pointed out in his review of Skeat's work, the value of this lies mainly in its Middle-English word-tracing. Kluge evidently belongs to the so-called "neuere Richtung" of philologians, to which belong such workers as Leskien, Osthoff, Paul, Braune, Sievers, Hübschmann, Verner, the discoverer of the famous law that explains the last large group of apparent exceptions to Grimm's Law, Sweet in England, and Storm in Scandinavia. It would be out of place here to state their methods and principles, which have been frequently set forth and not unfrequently attacked. They have now gained such a foothold that they can well afford to desist from polemics and point to the results of their methods. Besides their work upon the narrower fields of the individual Germanic and other Indo-European languages, they have obtained important results in the investigations upon metre (Sievers, Vetter), upon accent (Verner), upon ablaut (nearly all of them), in phonetics (Sweet, Sievers, Storm), in the science of language

(Paul's 'Principles of Language-History'). Now comes Kluge with his Dictionary, and we are also promised a Comparative Germanic Grammar by Sievers, a great Compendium by Brugman, that is to supersede Schleicher's, and a Latin Dictionary by Osthoff.

Etymology no longer consists in "radicarian linguistry," as A. J. Ellis calls such speculation in roots, themes, bases, types, as the older philologians indulged in. It is now growing to be a science as strict and exact as any, in so far as it is based upon a phonology which, like a physical science, recognizes no exceptions that cannot in some way or other be accounted for. On the other hand, etymology has still to deal with those subtle and difficult elements in language-growth, viz.: analogy, based upon psychology, and the influence of one language and nation upon another. Kluge's work surprises one with the large amount of institutional and political history which enters into sound etymology without running into the sermons of Trench or the rhetoric of Max Müller. Examine, for instance, such articles as *Ostern*, *Brot* (*Laib*), *Kaiser*, *nackt*, *blind*, *Hagestolz*, *Burg*, *deutsch*, *Gott*, *Käse*, *Gast*, *Hanf*, *Hemd*, *Locke*, *Leiche*, *lesen*, *Mann*, the group formed by *Bursche*, *Haus*, *Frauenzimmer*, *Imme*, *Jugend*, and *Kamerad*. The principle that words are never borrowed singly but in groups is quite evident when we think of the English sporting terms in the languages of the Continent, and the French fashion terms in all modern languages. But it has never been so freely and successfully applied to the older stages of the language as by Kluge. The sailors' language spread from Low German (Dutch chiefly). French furnished gambling terms, *e. g.*, *Daus*, *Pasch*. The Romans, who, according to Pliny, imported German geese extensively, gave the Germans the words *Flaum*, *Kissen*, *Pfühl*, *Pipps*. Weaving terms went with the art of weaving from the Germanic nations to the Romanic, and not vice versa, viz.: *Filz*, *Haspe*, *Rocken*, *Kunkel*. With the introduction of Christianity among the Germanic tribes went the terms pertaining to the Church and faith, either directly from the Latin, or, through the Arian church and Gothic, from Greek. Words are not merely borrowed in groups, but also preserved and even revived in groups, if once they had grown obsolete. Thus a group, viz.: *Kämpe*, *Halle*, *Gau*, *Elf*, *Hain*, *Heim*, *Weigand*, *Wat*, was revived in the eighteenth century, during the influence of English literature, by the patriotic poets. Our oldest words are, of course, those expressing relationship, the names of parts of the body, the numerals (see the introduction).

Kluge is very cautious on slippery ground. He is bold enough to say, "I don't know," or "This is by no means certain," where others know, or think they know. Among English philologians it is still the fashion to make a word Welsh when they are in a dilemma. Kluge has rescued two words from that unknown and therefore safe territory, viz.: *Bruch* and *Hemd*. There are as many as thirty new etymologies, and many more that are partly or largely new; *e. g.*, *gehen*, *beben*, *Graf*, *Hirn*, *Hornisse*, *Degen*, *Gott*, *Amsel*, *Weichbild*. For *Nest*, Pott's view is vindicated. Compare the above words and many others in Kluge's and in other dictionaries, old or new, and it will be clear what an advance there is in the former. The proper names are included. Interesting is, *e. g.*, Bismarck, under *Bistum*, bishopric, from "*bischoves marc*," upon which the estates of the family bordered. The reintroduction of *th* for *d* in English father, mother, hither, Kluge explains as a phonetic transition brought about by *r*. But he does not say how *r* could bring this about. Skeat thinks it due to Scandinavian influence; but is not the last middle-English period a rather late one for that influence? It is due rather to analogy with the more frequent words in *-ther*, several of them old comparatives, *e. g.*, whether, other, brother, nether, wether, feather, leather. Any one having only a meagre knowledge of German can, particularly with the aid of the English word-list, use this dictionary for English also. A number of words, however, are put down as modern English which are hardly so; *e. g.*, coom, cant, therf, hele, mixen. "Chary" (sub *Karg*) does not mean "sad" now. The following cognates in German and English are not marked as such: *erst*, erst; *Flinte*, flintlock; *verloren*, forlorn; *grunzen*, grunt; *jucken*, itch; *hügel*, how; *Kappes*, cabbage; *sengen*, singe; *stottern*, stutter; *tapfer*, dapper; *strotzen*, strut; *taugen*, do; *Schosz*, *Schöszling*, shoot; *Wahn* (in *Wahnsinn*), wan (?), wane; *gewahr*, aware, beware; *Welker*, walker; *Wat*, weeds; *Pferd*, palfrey. The articles on *Star*, *Seide*, *Sprache*, *Seife*, *Ufer*, *dunkel*, *Fenster*, are good examples of how much regard is had for English.

In every respect, Kluge's work combines strict science with popular features. It is a model of conciseness and brevity. There is no learned clap-trap, such as Skeat's list of Aryan Roots, which have still the form that they were supposed to have twenty years ago. Many articles we could wish much longer. The declension of nouns and the ablautseries of the verbs will be missed by many. *Na*, *nu*, *nit*, hardly deserve separate articles. If *Amulet* is given, why not *Nummer*, a word of much older importation? Among the few misprints, the following are annoying: "Price" and "prize," under *Preis*; *Stil* for *Stiel*, under *Halfter*.

Growth of the English Colonies. By Sidney Mary Sitwell. London: Rivingtons. Small 8vo, pp. 125, with index.

THIS is one of the small manuals which have lately been published in England in considerable numbers. It belongs to the series called "Highways of History," and aims at an outline of each selected topic independently of the others. Instead of treating history in the form of annals, or of a general narrative, which necessarily passes back and forth among widely separated places and subjects, this runs through a completed but brief sketch of each colonial settlement made by the mother country, from its first beginnings to the present time. It therefore does not profess so much to be history as a full analysis or table of contents of larger histories, arranged by topics. The method has its valuable uses; for a small handbook of this sort is a convenience to have at one's elbow to verify a date, or give a quick outline of events one may not choose to run down in more elaborate works. The task seems to be carefully and conscientiously done, making a trustworthy little volume.

BOOKS OF THE WEEK.

Abbey, H. The City of Success and other Poems. D Appleton & Co.
Armitage, E. Lectures on Painting: delivered to Students of the Royal Academy. G. P. Putnam's Sons. $1.75.

New York.

WE WILL FURNISH A SAMPLE Case (12 quart bottles, no two alike), pure California Wine, price $5. SONOMA WINE AND BRANDY CO., 30 Warren Street, New York.

SHORT ROUTE TO LONDON.

NORTH GERMAN LLOYD
MAIL S. S. LINE.

The steamers of this Company will sail every Wednesday and Saturday from Bremen Pier, foot of Third Street, Hoboken.

RATES OF PASSAGE TO LONDON, HAVRE, AND BREMEN.

I. Cabin, $80 and $100; II. Cabin, $60; Steerage, $20.

OELRICHS & CO., AGENTS,
2 Bowling Green.

*IN any family, whether large or small, but es*pecially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Professor J. B. Fonssagrives's 'Mother's Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1 25 for two volumes. Address Publisher of the *Nation*.

F. W. CHRISTERN,
37 West Twenty-third Street, New York,

Importer of Foreign Books, Agent for the leading Paris Publishers, Tauchnitz's British Authors, Teubner's Greek and Latin Classics. Catalogue of stock mailed on demand. A large assortment always on hand, and new books received from Paris and Leipzig as soon as issued.

The Nation.

NEW YORK, THURSDAY, JANUARY 17, 1884.

The Week.

THE receivership of the North River Construction Company, which was precipitated on Saturday evening by impending attachments upon the West Shore and Buffalo Railway, marks the failure of one of the boldest and most gigantic enterprises of our time. We say failure, not in the sense that the West Shore Road is not an accomplished fact, but because the expected profit in the undertaking has been lost, together with the greater part of the capital of $10,000,000 invested by the construction company. The road itself will remain, and whether it goes to foreclosure and sale under the first mortgage, or whether it remains in the receiver's hands for an indefinite period, it will be a thorn in the side of the New York Central and the entire "Trunk Line Pool." The failure, we are informed, is the consequence of a great miscalculation of the cost of the work. Such miscalculations are not uncommon, but they are less excusable in this case than in those of distant enterprises, where the work is not subject to easy and frequent examination by the responsible heads and financial managers of the undertaking. The road itself is of the first class in every respect. It is probably the best piece of work, in its initial stage, ever done in this country, and its financial breakdown is all the more complete by reason of the thoroughness of its construction, for thoroughness implies cost. Contemplating the magnitude of the enterprise and of the losses which individuals have suffered through the decline of its securities, the reflection is forced upon every candid observer that the West Shore Road was, from a business point of view, unjustifiable and chimerical from the beginning. Building a new double-track railway alongside an existing four-track railway, flanked by two other railways having the same terminal points, was, perhaps, the most daring exploit in the way of railroad competition in our history, or, if matched at all, matched only by the "Nickel Plate" enterprise, which preceded it, the owners of which managed to "work it off" before the hard times came on. The public need not waste their sympathy upon the sort of reckless competition which the Nickel Plate and West Shore Roads exemplify. It is this sort of competition which produces commercial reactions, and intensifies and prolongs them when they come.

There were 9,000 failures last year, with liabilities amounting to $173,000,000, against $100,000,000 for the year previous. This not only makes a bankrupt law more desirable than ever, but makes the passage of one more probable. Bankrupt laws in this country have always been the product of periods of commercial depression, and the present case promises to be no exception to the rule. Never before, however, has there been so much intelligent discussion in advance, which makes it all the more likely that we shall now get a better bankrupt law than any of our former experiments yielded.

A noticeable feature of the financial situation is beginning to show itself in the advancing rates of sterling exchange. The immediate cause of this is the large falling off in the exports of breadstuffs and provisions during the past month, on account of the speculative holding of grain and provisions at the West, and to a large extent, also, by New York speculators. There have already been several failures in New York and California of grain speculators, who have mistaken the situation and overestimated the foreign demand for American wheat. The unwarranted speculation in grain and provisions is, however, largely traceable to the distrust which has prevailed in regard to American railway securities, and to the plethora of unemployed money in the market. Owners of idle capital could see nothing to invest their funds in with confidence except the staple products of the country. The result has been that prices have been kept too high to justify exports, and the recent falling off has made a scarcity of commercial sterling bills against such exports, so that rates of sterling exchange have advanced 2½ cents on the pound since the beginning of the month. An equal further advance would bring the rates to the gold-exporting price.

The defeat of Senator Pendleton may furnish the Democrats with the "issue" they are in search of for the next campaign. It is absorbing the attention of the Democratic newspapers at present, and arguments are brought forward on either side which could not fail of having a powerful influence in a Presidential canvass. On the one hand, the disciples of Pendleton say that his defeat has deprived his party of its only claim to being a reform organization, and that the only way in which this loss can be restored is to "cut off the Ohio Democracy" from the national organization, and give the State over to the Republicans without a struggle. The disciples of Payne, on the other hand, say that Pendleton's election would have dampened the enthusiasm of the "boys" in all parts of the country, for it would have been equivalent to a pledge not to "restore the Government to constitutional principles" by turning out all of the Republican office-holders in case of the election of a Democratic President. They also make it known, in a somewhat indirect way, that Mr. Payne is a Presidential aspirant, and that, if nominated, he would be "good for a half-million contribution to the campaign fund." Meanwhile the discussion of the tariff is deprecated as being premature.

Governor Hoadly's inaugural address shows that he has recovered the mental equilibrium which he enjoyed previous to his remarkable campaign, for it contains some unusually sensible observations. He calls the attention of his party to the increasing power of the independent voters, and intimates pretty plainly that its only chance for success is to follow such a course as will command the support of those voters. He recommends the adoption of a constitutional amendment changing the date of the State election, at least in Presidential years, from October to November, saying very truly that its position as the only October State exposes Ohio to "expense, inconvenience, and possible corruption and degradation of the franchise." On the question of the Scott Liquor Law, he advises against all efforts for its repeal, and recommends only such minor changes as will not conflict with the reasoning upon which the Supreme Court of the State decided it to be constitutional.

Governor Waller, of Connecticut, has devoted a portion of his annual message to some remarks upon the recent failures to discover the authors of atrocious crimes within his State. While expressing his opinion that the outside comment upon these failures has been more severe than the circumstances warrant, he admits that criminals have sometimes been aided in escaping justice by the "loose practice of permitting juries in exciting capital cases to separate two or three times a day during the trial, and to mingle with the public, exposed to all sorts of improper influences." This may account for some of the failures, but the trouble with many of the others lies further back. In several cases the inquiry has never got beyond the coroner's jury, and the failures have been obviously due to the practice of using such a jury as a means of detecting crime. Practically it amounts to an investigation by the whole State. Whatever evidence the jury has is communicated to the reporters, who communicate it in turn to the public, not only of Connecticut, but of the whole country. Ample notice is thus given to all guilty persons of the evidence in possession of the authorities against them. The services of the coroner's jury in capital cases have been abolished with excellent results in Massachusetts, and Connecticut's experience has demonstrated in the most forcible way the desirability of dispensing with them everywhere else.

Congressman Robinson's inquiry about the dress worn by our ministers at the courts of Europe may lead to startling developments. He says he is determined to know "whether our representatives abroad are made to crawl on their bellies in sackcloth and ashes before the potentates" of the Old World, or "whether they are dressing and acting like American citizens." He has been informed that "our representative to Persia had to take off his boots and crawl on his belly in the presence of the Shah," and he considers such conduct beneath the dignity of an American citizen. "Our representative," he adds, "should have applied his boots to the exterior of the Shah, instead of taking them off his feet." That is what Mr. Robinson would call acting like an American citizen. Where he gets his information about our Persian representative's conduct we have no means of knowing, but we trust

that he has been misinformed. Soon after arriving at his post the representative sent an eloquent account of his brilliant and flattering reception by the Persian Court, an account which was subsequently somewhat impaired by the information that, after the reception was well over, he was respectfully but firmly requested to pay for all the handsome presents which had been made him during the ceremonies. We are not prepared to believe that in addition to that embarrassing deception he has been called upon to travel about in the uncomfortable manner described by Mr. Robinson.

Many people have supposed that Mr. W. D. Kelley was wanting in a sense of humor, but this is clearly a mistake. He has written a letter to the Chicago *Journal of Commerce*, in the character of the champion of "free raw material," for which he says "he has done as much, if not more, than any American legislator." But the twinkle appears in his eye when he goes on to say that he does not consider broadcloth raw material, nor scrap iron, nor pig iron, nor steel, nor wool, salt, sugar, lumber, coal, nor iron ore. In fact, he considers nothing raw material which we can by any possibility produce in this country. It looks as if tropical fruits were the only raw material known to him; so that his championship of raw materials is really a very good joke.

Mr. Charles Dudley Warner has written a letter to the Secretary of the American Copyright League on the subject of authors' rights, which the League has printed. It is a strong appeal for an international law on the ground which we have for a long time urged as the only possible basis for a new movement—that of simple justice. Mr. Warner says that what he asks Congress to do is to recognize the right of every literary man to enjoy the fruits of his labor, just exactly as every wool-grower or cattle-raiser does, without regard to whether he is a British or an American subject. We understand that the League wants to try a treaty again; but it makes very little difference whether they try that or an Act of Congress, if they cannot get the public generally to recognize that international copyright is a moral question. Neither the Senate nor the House will take any interest in the matter until the time comes when Americans are just as ashamed to use the old argument about "cheap books" as they would be to recommend stealing from foreigners because it might give us cheap clothes. The difficulty is a moral one.

Judge Barrett's play "An American Wife" has drawn out from an American wife, Mrs. Judge Barrett, a letter in which she insists that this drama was jointly written by the Judge and herself, he writing the "light parts" and she the "serious." The play, she says, was originally called the "Watchword," and the names of both authors appeared on the title page. "An American Wife" has, we believe, not proved a sufficient pecuniary success to justify a lawsuit, which would, however, have been of much interest not only in dramatic, but in legal and matrimonial "circles." A husband has still, we suppose, a right to the products of his wife's services, notwithstanding the married woman's act; and we cannot see why he should not utilize them to make her furnish a serious basis for his dramatic humor, just as well as to do the general housework, if he can. A suit to decide this in the Supreme Court, left to Judge Barrett's brothers on the bench, would have been very interesting.

The Westpoint (Ga.) *Enterprise* very properly corrects the Lafayette (Ga.) *Sun* for a glaringly inaccurate account of the flogging of a school-teacher from the North at Westpoint during the Christmas holidays. It seems that this white man, who teaches a colored school, "took a bright mulatto girl, a pupil of his school," to an amateur dramatic entertainment in that place. Now, the *Sun* said that he "purchased reserved seats, and, his fair companion being of such a white tinge, the managers did not notice the civil-rights performance," but "their attention was called to the matter and the couple was forthwith moved out of the house." "It is useless to add," it went on to say, "that the teacher was of Northern parentage, and a resident of North America, and that he hardly knew himself the next morning, after receiving a sound thrashing by the boys of Westpoint." The *Enterprise* very properly corrects this, and shows that although it is true that the Northern man did "carry a mulatto girl into our opera-house," it is not true that he bought reserved seats. "He purchased two tickets, and he and the mulatto walked to the front part of the hall," but were soon found out and made to sit in the rear, where they remained till the close of the performance. "It is true," adds the *Enterprise*, "that the boys gave him a good whipping, but it occurred just after the show, and not next morning, as the *Sun* says. Now the public have the true facts." This shows how calumnies about the social condition of the South are got up and circulated at the North and elsewhere to prevent emigration to that region. If it had not been for the *Enterprise* it would have gone all over the country that "the boys" whipped a white school-teacher on the following morning for taking a nearly white mulatto girl, one of his pupils, into the Westpoint (Ga.) "opera-house," when the fact was that they whipped him immediately after the performance.

Judge Ferris, of the County Court of Nashville, Tenn., recently made the observation on the bench that the Criminal Court of the same city was "gutting" the County Treasury through the heavy costs incurred by it. On Thursday he met Judge Allen of the Criminal Court, who informed him that his charge was false. They then promptly took each other by the throat, and drew large knives, but were seized by the bystanders and disarmed. There is a good deal of unconscious humor in the remark of the despatch, "Both gentlemen stand high in the community." This is a very common adden dum to accounts of Southern homicides and fights. The writer probably does not reflect that it suggests inevitably to civilized men all over the world the question, What kind of community must it be in which such savages can "stand high" or stand at all?

Judge O. A. Lochrane, who, as attorney for the holders of certain bonds repudiated by their endorser, the State of Georgia, created no little stir several months since by declaring his intention to fix the liability to redeem them upon the United States Government, as that Government really was in control of the State at the time they were endorsed, has just taken another step equally bold and brilliant. It seems that the State of Georgia recently filed a bill in equity, praying that the Judge be required to deliver up to be cancelled deeds to certain property in Atlanta, which should be declared the property of the State, and to pay over to the State the rents and profits from it, which he has been enjoying. The Judge saw here an excellent opportunity for testing the validity of the above-mentioned bonds, some of which he had obtained, before the suit began, from innocent purchasers for value, unaware of their attempted repudiation. A few days since he brought in a cross-bill, setting up the State's indebtedness to him as evidenced by these bonds, and prayed for a decree in his favor against the State. In this cross-bill the entire history of these bonds is given, but the published "interviews" last autumn, which the Judge underwent, have made the public sufficiently well acquainted with the transaction. In his pleading is set out the following resolution, passed by the Legislature of Georgia in 1843, which is to-day curious reading: "Resolved, That we regard the slightest breach of plighted faith, public or private, as an evidence of the want of that moral principle upon which all obligations depend. That when any State in this Union shall refuse to recognize her great seal as the sufficient evidence of her obligation, she will have forfeited her station in the sisterhood of States, and will no longer be worthy of their confidence or respect." Judge Lochrane reminds the State of Georgia that this very pretty resolution was ordered to be transmitted to the Governors of all the States, to be by them laid before their respective Legislatures.

The tragic fate of Mr. Delmonico has called forth a good deal of moralizing about the culpability of those relatives of insane persons who fail to put them under control as soon as the first signs of mental unsoundness show themselves. Most of this moralizing, if not all, of course comes from those who have never had to assume the terrible responsibility of dealing with a case of insanity, and are therefore preaching with inadequate knowledge. But even if it all came from experts, we doubt if it would be of much use to any one who was called on for the first time to decide whether a friend or relative was losing his mental balance. As all alienists tell us, there is no disease whose approaches are so insidious as mental disease, none of which the earliest signs are so slight, and misleading, and varied. Any one who looks for these symptoms in a medical book will find that there is hardly anything a man does, which it is not his habit to do, that may not be and is not often a sign of brain trouble,

however harmless or rational it may seem in itself. Nobody keeps such a watch on an apparently healthy person engaged in the active work of life as to notice these slight aberrations at the very outset, or to attach any importance to them even if they are noticed. Moreover, there is a score of things which may account for such a man's acting a little oddly besides brain disease. There is dyspepsia, which almost always exerts a very powerful influence on temper and conduct, and produces all sorts of strange effects. And there are "business troubles," and "domestic troubles," and social or professional disappointments—all of which are apt, in a greater or less degree, to break into the routine of a man's life, and cause abnormal ways of talking and acting—which may be signs of insanity, but which, as a matter of fact, in ninety-nine cases out of a hundred, are not. If friends and relatives were to treat them as such, especially in a place like New York, it would convert the city into a huge Bedlam, in which one-half the population would be trying to induce the other half to put itself in charge of keepers.

The real-estate men in this country show but little interest as yet in the movement for the nationalization of land in England. This is because the circumstances of the two countries are so entirely different. The English reformers think that the people ought to get the benefit of what they call the "unearned increment" of land, or the rise in the value caused not by the labor and improvements of the owner or occupier, but by the general increase in population and consequent demand for land. Whatever may be the case in England, with up-town lots in this city, particularly on the west side, while there appears at one time to be an unearned increment, this is replaced a few years later by an unearned shrinkage. With this it is difficult to know what to do. Under our present land system it falls upon the owner, though he is sometimes able to shift it upon the mortgagee. The public, however, occasionally get the benefit of it, through the land being abandoned on account of taxes. No discussion of our land problem will be complete which does not show how the shrinkage as well as the increment is to be dealt with.

Mr. Labouchere has published in *Truth*, as a Christmas "message of peace and good will," what he considers to be the programme of the English Radicals. He is the *enfant terrible* of the Liberal party, but there is no question that his political talk contains more of what the English working-class voters are thinking about than the "safe men" of the Liberal party are willing to admit. He now declares that the Radicals mean to have manhood suffrage, electoral districts, payment of members, a cheap $250,000 monarchy, the abolition of the House of Lords, local government for Ireland, elective county assemblies, radical land reform—making the landlords mere rent-chargers, and forbidding all ownership of uncultivated arable soil—the disestablishment of the Church, free education, both primary and secondary, and direct taxation; the income tax to be progressive, and distinguishing, *à la* Bismarck, between income from labor and income from investments.

Sir Samuel Baker publishes an article in the *Nineteenth Century* on the future of the Sudan, of which he was Governor or Commander for several years. He now predicts dreadful consequences to the peace and order of the region if it be abandoned. The slave-trade, he says, will be revived, and marauding will prevail on a great scale; but he evidently makes little account of the element of religious fanaticism. The difficulty of holding the Sudan owing to the great patch of desert which intervenes between it and Egypt, he does not attempt to minimize, however, but looks to overcoming this by railroad communication. He is evidently a great Jingo, like all the military adventurers, and is strongly opposed to anything like an abandonment by England of any territory once occupied. He still mourns even over the loss of Kandahar.

The denunciation of Henry George by the Irish press, in spite of the adhesion to him of Michael Davitt, furnishes strong confirmation of the opinion we have all along expressed, that his following would in every country be confined mainly to the town population, or in other words to people who neither own nor cultivate any land. His scheme is one of confiscation pure and simple, and, if carried out, would really remove all property from the domain of morals. It is not perhaps for this reason mainly, however, that farmers take no stock in it. Their difficulty is that those who own land want to keep it, while those who cultivate land and do not own it, want to own it. The Irish farmers are just now expecting, after ages of waiting, to become proprietors of their holdings, and are therefore by no means in the mood to surrender them to the state and pay rent on them once more, on Mr. George's assurance that by so doing they will help the human race and solve the labor problem.

The latest news appears to indicate pretty clearly that the Chinese are preparing for war. In fact, the Marquis Tseng has intimated to an interviewer that the real fighting will shortly begin. The Chinese have one distinguished commander, a certain Tso Lung, who did great things both against the Taepings and against the border Tartars, and is described as one of "Plutarch's men"—that is, a person of extreme simplicity and honesty combined with genuine heroism. He believes in China thoroughly, and has for twenty years wielded enormous power, but does not steal a cent, and decapitates everybody whom he suspects of stealing. He is a military commander, too, of a high order. His hatred of women is unbounded, and not only includes his wife, but did include his mother when living. His chief of the staff is an expert executioner, whose presence during councils of war must exert a powerful influence in producing unanimity. The Marquis Tseng intimates that the French will have their bellyful of fighting before all is over.

A French marquis has got into trouble arising out of a colonization scheme known in France as the "Port Breton affair." The Marquis de Rays, about whom little appears to have been known, got up a bogus colony, lands in which he disposed of at five francs a hectare. He appealed to the religion and patriotism of investors, and called upon them never to forget that "France was powerful so long as she remained true to her divine mission." This appears to have been quite enough, and land ran up from 5f. to 20f. in no time. Port Breton is only 7,000 hectares in extent, but as no one knew it but the Marquis, 700,000 were bought, and the purchasers chartered a vessel and started off to colonize it. They did not know either, till they got there, that it was a kind of desert, shut in by high mountains, and that the soil was unsuited for any kind of cultivation or even pasturage. The happy pilgrims, ignorant of all this, went on board, sang a hymn, and set sail. When they reached the colony they found no means of support, and began to die of fever and hunger. The French courts are now looking into the Marquis's case. Experience does not seem yet to have taught the French investor that a man who calls himself a gentleman does not usually try to sell lands in foreign countries through appeals to their love of God and France, unless he is a swindler.

The full text of the treaty between Chili and Peru, as published by the *Herald*, confirms the view that we have always expressed in these columns of the probable success of the Iglesias movement. The one thing that was essential for a lasting peace in South America was that a Government should be set up in Peru which would accept the terms that Chili had won the right to impose by conquest. The attempt which Mr. Blaine made to set up a Government competent to treat proved a terrible failure, because it produced among the Peruvians the impression that the United States was going to dictate the terms, and this induced them and the Calderon "machine" (recognized as the Government by no Power except the United States) to keep up an attitude of bombastic defiance, which Chili brought to an abrupt end by clapping Calderon himself into jail. Then it began to appear that the determination that the Peruvians must die in the last ditch was really a determination arrived at not by the Peruvians, but by our energetic Secretary of State.

The Iglesias treaty contains terms certainly no better than Peru would have got at the close of the war. Tarapaca is ceded absolutely to Chili, and Tacna and Arica are to be occupied by Chili for ten years, at the end of which period there is to be a vote to ascertain whether the inhabitants desire to become Chilians or to remain Peruvians, and the annexing country is to pay the other $10,000,000. Half the guano hereafter produced is to go to the creditors of Peru. These are the main provisions of the treaty, which is reinforced by an additional protocol, giving Chili the right to maintain an army of occupation until its terms are ratified, and binding Peru meantime to maintain the occupying forces by the payment of $300,000 a month.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, January 9, to TUESDAY, January 15, 1884, inclusive.]

DOMESTIC.

SENATOR EDMUNDS on Monday was reëlected President pro tem. of the Senate by the Republicans. Senator Anthony declined the position on account of the precarious state of his health.

The Senate on Friday passed a bill appropriating $1,000,000 to continue the improvements already begun by the Mississippi River Improvement Commission.

Senator Aldrich, of Rhode Island, has introduced a bill providing a new scheme for a permanent basis for a bank circulation. Mr. Aldrich would issue a three per cent. bond, and with it redeem the outstanding bonds bearing a higher rate of interest at the market premium. This plan has been advocated by the Comptroller of the Currency. His theory was that the banks would be willing to exchange their four per cents for a new three per cent. at par, having the same time to run, if accompanied with an offer of a premium. The holders of the bonds would receive in the premiums their interest in advance, which would be available for loans at higher rates, while the Government would be able to use some of its surplus to save some interest which it would be compelled to pay later. Moreover, the country would be benefited by having the banks placed on a firmer basis.

The Senate Finance Committee on Tuesday continued the discussion of Senator Sherman's bill authorizing the issue to national banks of currency to the amount of 90 per cent. of the market value of bonds deposited to secure circulation; and Senator Aldrich's bill to facilitate the exchange of the 4 per cent. for 3 per cent. bonds was discussed at considerable length. No decision was reached. During the discussion Senator Sherman proposed an important amendment to his own bill, designed to meet the objection that the measure would base the amount of circulation upon a fluctuating standard. He proposed to authorize the Secretary to issue national bank notes up to 90 per cent. of the face value of the 3 per cent. bonds deposited as security for circulation. Where higher-rate bonds are deposited, he proposed to compute the interest above 3 per cent., and to allow circulation to the amount of 90 per cent. of the aggregate interest over 3 per cent. for the whole time such bonds have to run.

The Senate Committee on Agriculture, of which Mr. Miller of New York is chairman, is considering a bill for the Government inspection of pork, which, if passed, Mr. Miller thinks will do much to remove the opposition of European governments to American pork products. On Wednesday, resolutions were introduced in both Senate and House directing an inquiry into the facts of pork prohibition, and calling for a report as to what legislation is necessary to protect the interests of American citizens.

A bill was introduced in the House of Representatives on Monday by a Kentucky Democrat to repeal the national Civil-Service Law. An effort will be made by the friends of civil-service reform to secure a report as early as possible upon the bill. The Republican friends of the reform are anxious that the Democrats shall have an opportunity to define their position. The majority of the Committee on Civil-Service Reform, to which the bill was referred, unquestionably favor the bill.

It is believed that Mr. Morrison's tariff bill, which is to be presented to the Ways and Means Committee of the House, will propose what is known as a horizontal reduction, of an average of from 20 to 25 per cent., in the whole tariff list. It will contain, besides, provisions to correct some of the crudities of the existing tariff, and will propose some additions to the free list.

Chief Nimmo, of the Bureau of Statistics, reports that the reduction in the average ad-valorem rate of duty on dutiable goods under the new tariff for the quarter ended September 30, 1883, as compared with the corresponding quarter in 1882, was only 2.12 per cent., making due allowance for the changes in the law with respect to the valuations of casings and coverings. The reduction in the average ad-valorem rate of duty on sugar was only 2.7 per cent. for the quarter ended September 30, and somewhat less for the months of October and November. These reductions are much less than was expected.

Representatives of French commerce are becoming alarmed at the threats of reprisals on the part of the United States. Léon Choteau is announced by cable to be on his way to this country for the purpose of appearing at Washington as a lobby agent in opposition to retaliation. Representatives of French houses are already in that city.

The net decrease, owing to the reduction in postage, in the revenues at 140 principal post-offices for the fourth quarter of 1883, as compared with the same quarter of 1882, was $79,948. These offices collect about one-half of the entire postal revenues. The three offices showing the greatest loss were New York, $25,318, Chicago, $11,281, and Boston, $10,455. The largest increase was at Louisville, Ky., where the receipts for the last quarter of 1883 exceeded those of 1882 by $13,163.

Speaker Carlisle has nominated for Regents of the Smithsonian Institution Congressmen Singleton, of Mississippi, Wilson of West Virginia, and Phelps of New York. The last-named is a Republican.

The sentiment among the Democrats in Congress in favor of enacting a national bankruptcy bill seems stronger than it has been for years.

A call for $10,000,000 three per cent. bonds was issued on Saturday afternoon by the Secretary of the Treasury.

The Greely Relief Board will probaby recommend that two vessels be fitted out and sent to the Arctic regions at the opening of the season, in accordance with the views expressed by nearly all of the experts who appeared before the Board.

A caucus of the Republican members of the Iowa Legislature, on Tuesday evening, unanimously renominated Mr. Allison for United States Senator.

The defeat of Senator Pendleton of Ohio for reëlection has caused great dissatisfaction among the best elements of the Democratic party.

Governor Hoadly of Ohio was inaugurated on Monday with very simple ceremonies.

In the State Senate at Albany on Wednesday Mr. Robb introduced a carefully prepared bill amending the charter of New York city. It gives the Mayor, after January 1, 1885, sole power to appoint the successors of all heads of departments and all Commissioners, including the Commissioner of Excise, and all Police Justices and City Marshals, all members of any board or commission, the Commissioner of Jurors, and two Inspectors of Weights and Measures. Every head of department named, except as otherwise provided, shall hold his office for six years. The Mayor can remove the heads of departments, except street-cleaning, for cause, subject to approval by the Governor. A similar bill was introduced in the Assembly.

At Albany on Monday evening the Senate voted to direct its Committee on Cities to investigate the Department of Public Works in this city. The Tammany Senators voted for the resolution. In the Assembly a resolution directing that a special committee of five be appointed for the same purpose was carried on Tuesday. It is to report results and recommendations before March 15.

Considerable dissatisfaction with Speaker Sheard's standing committees of the New York Assembly is expressed. The Young Republicans who have been sent to the rear by the "old-timers" make no pretence of concealing their disapproval. The complaint is made that the organization has been used to restore to a position of influence men who have been condemned by the popular voice, and for the purpose of pressing on this session measures which have never found favor in Albany except among the jobbing element of successive Legislatures. Mr. Roosevelt, Chairman of the Committee on Cities, was displeased with the appointment of a clerk to his Committee without consulting him, and wholly without his knowledge. The matter was arranged on Monday to suit him.

In the Assembly on Friday a Prohibitory Constitutional Amendment was introduced, and the Speaker referred it to the Committee on Internal Affairs.

The report of the Railroad Commissioners of this State was sent to the Legislature on Monday. As to freight rates and transportation, a full account is given of the Board's labors. The complaints received have less to do with excessive rates than with other alleged abuses, such as unjust discriminations manifested against individuals in the giving of special rates and against communities located at non-competitive points. The Board issued 12,000 circulars calling for statements of complaints and abuses. About one hundred replies were received, of which a large number "alleged satisfaction with the existing condition of affairs." The report gives a detailed account of the proceedings of the Board in investigating the question of pro rata freight rates. The matter is to be further investigated.

The New York State Superintendent of Public Works, in his annual report, strongly advocates the protection of the Adirondack forests.

The New York Court of Appeals met on Monday in its new rooms in the State Capitol at Albany for the first time. A resolution from the New York Bar Association was presented, requesting the Judges to wear robes of silk. They will consider the matter.

The message of Mayor Edson, of this city, transmitted to the Board of Aldermen on Thursday, was a long and uninteresting document, summarizing the work of the various city departments, and making few recommendations of any moment. He asks for hearty coöperation in the work of the city Civil-Service Commission.

Leon Abbett was inaugurated Governor of New Jersey on Tuesday at Trenton. In his inaugural address he advises a radical reform of the tax laws, and the abolition of the contract system of State-prison labor.

The Texas Legislature has met in extra session. The Governor's message deals principally with remedies for the fence-cutting war. He recommends that fence-cutting be made a penitentiary offence; also that a penalty be imposed for fencing off the residence or land of another.

Governor Murray, of Utah, in his message to the Territorial Legislature, says: "Marriage should be made by law a civil compact, to be entered into only by persons competent, and the contract valid only as between one man and one woman. Any other marriage, under any circumstances, should be declared void from the beginning. Should individuals, denominations, or associations desire to impose any other additional requirements or solemnities upon the civil contracts, they should be regarded as religious obligations only, not to be enforced or annulled by process of the civil laws."

The North River Construction Company, which built the New York, West Shore and Buffalo Railway, was put in the hands of a receiver on Saturday evening, on the application of the President of the New Jersey and New York Railroad. Chancellor Runyon,

of Newark, N. J., appointed Judge Ashbel Green the receiver. General Edward F. Winslow, the President of the company, said: "The application was made in the interest and for the protection of both creditors and stockholders of the company, for the purpose of holding intact the assets of the company, among which is more than $20,000,000 of the stock of the New York, West Shore and Buffalo Railway Company, constituting a majority of its whole capital stock."

George De B. Keim was on Monday elected President of the Philadelphia and Reading Railroad Company, to succeed Mr. F. B. Gowen.

A passenger train on the Erie narrow-gauge road was set on fire by oil upon the track near Bradford, Pa., on Tuesday. Of the forty passengers on board three were burned to death and fifteen seriously injured, some of them fatally.

A great gale and storm prevailed along the coast on January 8 and 9, doing serious damage to shipping, and wrecking a number of fine piers.

The trial of James Nutt for the murder of N. L. Dukes, his father's murderer, was begun at Pittsburgh, Pa., on Monday.

Funeral services in memory of Herr Lasker, the German Liberal, were held in this city on Thursday. President Andrew D. White, of Cornell, made an address in English, and Mr. Carl Schurz in German. On Saturday the body was placed on the steamer *Neckar*, for conveyance to Germany.

The body of Mr. Charles Delmonico, the noted restaurant proprietor of this city, who had been missing for some time, was found on Orange Mountain, New Jersey, on Monday. He had evidently died from exposure. His mind had been weakened by business cares.

Mrs. Valeria Stone died in Malden, Mass., on Tuesday. She gave to colleges and for public purposes, during her life, about $2,000,000.

The late Julius Hallgarten, of this city, bequeathed $50,000 to Dartmouth College, $50,000 to the University of the City of New York, and $58,000 to various charitable institutions.

William Morton, the Arctic explorer, died at Sitka, Alaska, on December 31. He was a member of the Grinnell polar expedition of 1849, of Dr. Kane's Franklin expedition when he discovered the open polar sea, of Dr. Hall's *Polaris* expedition, and was rescued, after the wreck of that ship, from an open boat at sea.

FOREIGN.

The display of energy at the Woolwich Arsenal, England, and the arrival there of immense stores such as are required by an army on the march, have given rise to the belief that the English Cabinet will soon decide to despatch reinforcements to the army in Egypt. The Economic Committee, recently appointed by the Khedive, recommends the discharge of fifteen hundred native officials. Abd-el-Kader, the Minister of War, estimates that the evacuation of the Sudan will occupy seven months' time and involve an expenditure of $5,000,000.

Nubar Pasha, the new Egyptian Premier, assumed his office on Wednesday. His ministry is popular in Cairo. Steps were immediately taken for the evacuation of the Sudan. A military commission under Sir Evelyn Wood will arrange the movements. It is thought that one year will be required to completely withdraw the Egyptian troops. The French press attack the policy of England in abandoning the Sudan, and it is asserted that Prime Minister Ferry believes that the present is a good time for France to regain her position in Egypt, but his Cabinet disagree with him.

The city of Khartum is now considered lost to Egypt. Col. Coetlogon telegraphed the Khedive on Saturday for instant orders to retreat. Nubar Pasha, the Egyptian Prime Minister, telegraphed an order that all the Christian population should leave Khartum, but that the garrison should remain until further news should be received relative to the advance of the forces under El Mahdi. The main body of El Mahdi's troops, numbering seventy thousand or more, was on Sunday reported advancing upon Khartum. The Egyptian Minister of War will go to that city to superintend the evacuation. El Mahdi demands $10,000 ransom for four nuns and five priests whom he holds captives. On Monday the report was received that the rebels had burned and sacked Heluan.

Despatches from Khartum on Tuesday reported that the people on both sides of the Blue Nile had declared for El Mahdi. All communication with Sennaar has been stopped. Steamers sent to convey troops and despatches to Sennaar have returned after having gone a short distance. Another alarming rumor on that day was that Sheikh Senussi was advancing to join El Mahdi. If this report is true, Egypt is in the greatest danger, because the influence of Senussi extends along the whole North African littoral to Egypt, throughout the Syrian Desert, and among the Arab tribes bordering upon the Suez Canal. From Tripoli to Dongola, or to Alexandria, is only fifteen to twenty days' camel march.

The British military authorities having refused permission to General ("Chinese") Gordon to proceed to the Congo River, he has been compelled, at great pecuniary sacrifice, to resign his commission in the British army in order to fulfil an engagement with the King of the Belgians. He goes to the Congo in a fortnight, principally to suppress the slave trade in the district where the Sudanese slavers mainly procure their supplies. His resignation has not yet been accepted.

Despatches received from Hong Kong on Wednesday reported that an explosion, which occurred at Hanoi on December 28, destroyed two batteries of French artillery. Two thousand Anamites attacked a French post, which was held by fifty marines. After several hours of hard fighting, the enemy retired with the loss of 100 in killed and wounded.

The Marquis Tseng is living quietly at Folkestone, England, and is very bitter about the Franco-Chinese affair. He asserts that all accounts of French victories in Tonquin have been overdrawn. He says that at Hunghoa the French will find a sufficient force of Chinese to give them a proper reception. The capture of Sontay has, he claims, strengthened the war party in China. On Saturday it was asserted in Paris that direct negotiations between China and France would soon be resumed on the basis of a new frontier in Tonquin and amnesty for the Black Flags. China is also to guarantee the free navigation of the Songka River to Laokay. A Berlin newspaper on the same day published a decree by the Emperor of China, urging upon his troops an energetic resistance to the aggressions of the French.

French advices from Pekin, received on Sunday, reported that a mob was threatening to burn the Catholic churches and mission-houses, and that the feeling of the Chinese populace was all for war. The movements of Chinese military forces are incessant, and it is calculated that over 200,000 Chinese troops are now armed with Remington rifles. The authorities of the province of which Canton is the capital are vigorously preparing for war. Six thousand Chinese troops have been sent to Hainan. Barges have been sunk in the Canton River to block up the channel. A decisive battle is expected soon at Bacninh. Tuduc, formerly King of Anam, is reorganizing the insurgents.

At a dinner given on Monday evening in Madrid to free-trade leaders to celebrate the conclusion of commercial treaties between Spain and various countries, speeches were made in which great stress was laid upon the beneficial effect the provisional treaty made with America will have upon Spanish trade.

In a conversation upon Spanish political affairs, Señor Castelar recently said: "Like the majority of Spanish Republicans, I am favorable to free trade as a means of improving our relations with England, France, and the United States. These are our natural friends. The English-speaking races on both sides of the Atlantic have no better friend in Europe than myself, even though I have sometimes dissented from their foreign policy."

In the Spanish Chamber of Deputies on Tuesday Señor Castelar condemned King Alfonso's visit to Germany, declaring that it was inopportune and imprudent, betraying as it did hostility to France.

By invitation of King Alfonso, the Comte and Comtesse de Paris went to Madrid on Saturday, and were warmly received at the royal palace.

The Russian Senate has decided to endeavor to obtain an immediate abrogation of the anti-Jewish laws which were passed in May, 1882.

The Russian budget for 1884 estimates a deficit of 3,406,662 rubles (about $2,843,000), which the Government proposes to cover by a new tax.

General Ratislav-Andreievitch Fadeyev, Russian Director of Roads and Canals, is dead, at the age of fifty-eight. He was the author of two works on Pan-Slavism which attracted much attention throughout Europe in 1860 and 1870. In the latter he advocated the protection of the Slavs, the partition of Austria, and a war with Germany.

Documents have been seized by the Russian police showing that a revolutionary league exists at Moscow among the students. There is a story in circulation in St. Petersburg that Jablovsky was one of the planners of the recent attempt on the Czar when hunting.

It is asserted that the officials in St. Petersburg have obtained possession of a letter in cipher, which was found in the lodgings of a Nihilist in London who had been closely communicating with Irish malcontents. The letter, it is believed, advises simultaneous attack upon the Emperor William of Germany and the Czar of Russia.

The system of boycotting has been revived in County Mayo, Ireland.

The *Irish Times*, of Dublin, intimates that the tour of Henry George and Michael Davitt through England and Scotland has been abandoned, owing to the hostility of one section of the Irish party to Mr. George.

The White Star Steamer *Celtic* arrived at Queenstown on Monday in tow of the *Britannic*. She had been out from New York thirty one days, struggling under sail, her main shaft being broken.

Mr. James Russell Lowell has accepted the Presidency of the Birmingham and Midland Institute, England, for 1884.

There was much excitement on the Stock Exchange of Glasgow, Scotland, on Tuesday, owing to the decline in values of the leading English and Scottish railway and Canadian securities.

Rosa Bonheur, the celebrated painter, who has been very ill, has recovered her health.

At the annual meeting on Thursday of the Montreal Corn Exchange Association, perhaps the most important trade organization of that city, resolutions were passed to the effect that it is the true interest of farmers, flour-millers, the grain trade, and the people at large to abolish all taxes on breadstuffs, and to establish untrammelled interchange of natural productions between Canada and the United States.

THE PROPOSED WINE RETALIATION.

THE suggestion made by M. Simonin, the French economist, in protesting against the exclusion from France of American pork, that the Americans would probably retaliate by excluding French wines, appears likely to be taken seriously by some people over here. The Boston Produce Exchange has actually adopted a resolution calling on Congress to pass a bill restricting or prohibiting the importation into this country of such products of the manufacturers of France and Germany "as are injurious to citizens of the United States; and particularly to restrict or prohibit the importation of the wines of those countries." What gives piquancy to this resolution is, that the preamble frankly acknowledges that the prohibition of the importation of American pork by the French and German Governments is not, as pretended, a sanitary measure, but a measure of "protection to their home industry," and therefore "an unjust discrimination against American production." This, from a body who are probably nearly all Protectionists, is what Mr. Squeers used to call "richness."

The project has so many of the marks of foolishness that it is not easy to say which one is the most conspicuous. In the first place it seeks to punish American wine drinkers for the sins of German and French pork-butchers. But it will fail to do this unless means can be found to prevent the importation of German and French wines through English merchants. France imports wines from Italy, Spain, Switzerland, Hungary, and California. Who is to determine what portion of the wine she sends to England is of her own growth, and therefore to be prohibited? What right have we to ask the English merchant where he bought his wine? The only way to make the retaliation effective would be to prohibit the importation of all adulterated wines, and then to station a corps of analytical chemists at every port to examine every cask and bottle that comes in. But this would not answer the purpose, because it would admit German and French wines that are found to be pure, and it is notorious that the Rhine wines of Germany are pure when they leave the place of production, the Government exercising, in the interest of German consumers, extreme vigilance to prevent adulteration. Moreover, the amount of German wines imported into this country is a mere trifle, and the loss of the trade would never be felt on the other side of the water except in the way of making Rhine wines a trifle less costly to the bloated aristocrats of Germany, who are our real enemies in this matter.

Again, it is to be observed that the proposed retaliation proceeds upon the idea that the exclusion of our hog products by Germany and France is a measure of protection to home industry, and not for the protection of health at all. If it is in reality a sanitary measure, they have a right to do what they have done. If it is, as we believe, a measure to protect the native pork producer against American competition, then we are bound to show that we have no laws protecting our own producers in any line of trade against the competition of German and French producers. It would be ludicrous to attempt anything of the sort, because we not only protect our cloth, silk, iron, and steel manufacturers against theirs, but we make a boast of it, and claim great merit for doing so. Senator Van Wyck is right in proposing to amend the law of retaliation so that it shall apply only to countries against whose products we have no duties levied for other purposes than revenue. Let us first cast out the beam from our own eye. But is it not rather a late hour for us to discover that French and German wines are adulterated? How have we found it out at all—by resolution of the Chicago Board of Trade, or by act of Congress, or by the inner consciousness of free-born citizens? If we are to retaliate, let us do so by some decent method. Let the National Academy of Sciences be called in to examine the wines of France and Germany which commonly reach our ports, and tell us what proportion are deleterious to health and how deleterious they are. Let us at least observe all the forms of respectability which these countries have observed before we imitate their folly. The truth is, that Germany and France injure themselves by excluding a cheap and necessary article of food far more than we can injure them by excluding their wines. The proper thing for us to do is first to make up a case establishing conclusively the wholesomeness of our exported hog products, as it is easy to do, and then inform those governments that their action is noted as unjustifiable and unfriendly. If any government can afford to make a permanent enemy of the United States for the sake of gratifying its own swineherds, let it do so and welcome.

MR. HEWITT'S EXPLANATION.

WE do not think Mr. Hewitt ought to have been condemned, even if he had called on the British Minister for the express purpose of telling him not to mind the O'Donnell resolution of the House of Representatives. Anybody who took any part in procuring the passage of that remarkable document, indeed, owed it to himself to tell everybody concerned that it was simply a bit of bunkum, which was never intended or expected to have any effect beyond pacifying the administrators of the Irish skirmishing fund. No public man in America of Mr. Hewitt's standing ought to have been expected to act as if he took the proceeding seriously, or to abstain from letting the British Minister know that it was a comedy.

Where Mr. Hewitt, in our eyes, lays himself open to just censure is in his attempting to show that there was some serious basis for the resolution in the nature of a precedent, or that it called for the discharge of a duty which the Government really owes to its citizens residing abroad. He said on Saturday:

"I observe that the newspapers criticise the resolution which I offered, from a mistaken idea that I proposed to interfere with the course of justice because O'Donnell was an Irishman. This is a mistake. I hold, with Marcy, Webster, and Seward, that the Government is bound to protect its citizens in their rights in a foreign country; and the right to be hanged according to law, and not in contravention to it, is just as sacred as any other."

But he does not hold with Marcy, Webster, or Seward at all, or rather Marcy, Webster, and Seward do not hold with him. His resolution asked the Government to procure a postponement of the execution of a foreign court, not because any wrong had been committed in the course of O'Donnell's trial, but in order to enable it to examine the proceedings, to see whether any wrong had been committed. In other words, the resolution asked the Executive to claim for itself the right to review the proceedings of British criminal courts in all cases in which the defendants claimed American citizenship. None of the eminent men whose authority Mr. Hewitt cites ever did, or, we venture to say, ever thought of doing, anything so preposterous. The rational American ground on such matters was clearly stated by Mr. Marcy in 1855, when he wrote: "All that we demand of Austria—and this we can demand as right—is that in her proceedings against American citizens for offences committed within her jurisdiction, she should give them the full and fair benefit of her system, and deal with them as she does with her own subjects, or with those of other foreign Powers." "Her system" was at that time a despotic system, and her jurisprudence differed widely both in substance and form from our own. This rule applies, therefore, *à fortiori*, to Great Britain. All that we have a right to ask of her with regard to the treatment of Americans accused of crimes within her borders, is simply all that we should permit her to ask, under like circumstances, of us—viz., a fair trial according to her laws. We were bound to presume that O'Donnell had such a trial till the contrary was shown. Mr. Hewitt had no reason for supposing that he had not had it, and has alleged none. The prisoner was defended by able counsel, who in no way impeached the procedure, and raised no point in arrest of judgment. What bothered them was what bothers the defence in all criminal cases—namely, the evidence. The only thing, in fact, which O'Donnell had to complain of was the jury's having believed the testimony produced by the Crown.

What Mr. Hewitt's resolution meant, therefore, if it meant anything, was that when the American Government did not like an English verdict against an American citizen, there ought to be a new trial. The notion that eminent lawyers, like Marcy, Seward, and Webster, ever put forward such a claim, or gave it any countenance, would hardly be worth examination if the use of their names in connection with this business was not likely—by giving an air of seriousness to the interference of the House on O'Donnell's behalf—to help the Irish advocates of murder and arson in the monstrous game of deception which they are practising on their poor countrymen. It is this which makes the whole transaction so pitiful. If Mr. Hewitt and his fellow-Representatives consider it consistent with their self-respect and their respect for their countrymen to get their Government to put forward ridiculous pretensions

in behalf of a murderer, it is bad enough, but it is not irremediable. They will get their deserts from the sober judgment and from the conscience of the American people. What we most complain of is, that they should needlessly go through a performance which is likely to increase the power of the apostles of assassination over the poor Irish in the United States, and give a sort of respectability to the truly infernal schemes by which the Irish cause has, during the last three years, been disgraced both at home and abroad. There are no worse or more cruel enemies of that cause than Americans who, either for their own amusement or for political gain, lead the Irish who give money so freely to the dynamiters to believe that the people of the United States put men like Joe Brady or O'Donnell in the noble list in which the names of Sarsfield, Emmett, Wolfe Tone, Flood, Grattan, and O'Connell, Kosciuszko, Kossuth, and Mazzini are enrolled.

ANOTHER SOLUTION OF THE MORMON DIFFICULTY.

THE Mormon problem came up again on Friday for discussion in the Senate, apropos of a bill introduced by Mr. Cullom, of Illinois, for the reorganization of the Territory of Utah. The reorganization this time is to make the Government consist of a Governor and Council of nine members, appointed by the President, who are to be citizens of the Territory. How this is to overthrow the moral authority of the Mormon Church, which is the root of the whole Mormon trouble, Mr. Cullom did not explain. He denounced the Mormons vigorously, as all the orators do, but his principal charge against them was that they disliked the United States Government, and imported paupers from Europe whom they taught to hate it too. To remedy this state of things, we must, he said, take from the Mormons all legislative power and put it into the hands of a council of nine appointed by the President, which would even be "an act of mercy to these misguided people, and would release them from the domination of their priesthood."

Mr. Cullom was followed by Mr. Brown, of Georgia, whose remarks will well repay the perusal of all sober-minded persons. He did what seems at this juncture to be very necessary—and that is, remind the people of the United States that our organized Territories are, like the States, inhabited by citizens of the United States, and that citizens of the United States have to be governed constitutionally, as long as they are not in a state of armed revolt. Now the Constitution prescribes that no person shall be deprived of life, liberty, or property without due process of law, or held to answer for an infamous or capital crime without the presentment of a Grand Jury, or be punished without a trial before a jury of the vicinage, or be made the victim of a bill of attainder or of an *ex-post facto* law. It does not make any exception in the case of polygamists or bigamists, or priest-ridden people, or people who hate the United States, or who import foreign paupers. The provisions of the United States Constitution regarding the punishment of crime are not, in fact, intended wholly or mainly for the protection of the godly and well-disposed, but of the ill-conditioned, obnoxious people whom their neighbors would like to bring to justice. A large proportion of the white population at the South to-day—perhaps the bulk of its governing class—dislike the United States Government, and teach their children to dislike it; but would any sane man now propose for this reason to disfranchise them, or visit them with legal punishment of any kind? Probably two-thirds of our Irish are as priest-ridden as the Mormons, and as much disposed to put the spiritual above the temporal power, and as much occupied with non-American politics as the Mormons, and much less orderly and industrious; but would any rational person propose to cure these evils by taking the suffrage away from Irish Catholics?

A great deal of the talk about the Mormon difficulty, in fact, seems to be based on an idea which originated we know not where, that it is open to Congress to outlaw a whole community, in a time of profound peace, because some members of it commit a particular offence with the connivance or approval of others, or because the majority of the people of the United States dislike their religious opinions or the power of their church government. Some have even gone so far as to think that the President can declare martial law and send troops in order to extirpate unchastity in a particular district. But all this is a mischievous hallucination. The Mormons have done nothing which entitles us under the Constitution to punish them collectively. There is only one offence known to the United States Constitution which enables Congress or the Executive to inflict disabilities on a community *en bloc*, and that is armed rebellion. In time of peace we have no right to take away one man's vote because another man has too many wives, or punish him in any way because he has too much respect for his priests, or because we do not like his Bible. The great principle of this Government is that each man shall suffer for his own crimes only, and shall not suffer at all in time of peace without due process of law.

We are clearly on the wrong tack about Mormons and their polygamy. What social and material progress will not do to extirpate polygamy must be done by moral means. As Senator Brown very properly remarked, "the Christian Church is the true medium to deal with the Mormon question. Millions of dollars are sent out yearly to convert the polygamists of India and China to Christianity. Some of this money spent at home, among people who speak our language, might result in producing a great change in the condition of the Mormon problem." These are words of soberness and truth, and it is high time they began to be listened to. Wholesale punishment for obnoxious opinions, by what are essentially acts of attainder, is a dangerous precedent to introduce into the conduct of our Government, even if it could succeed in making the 12,000 Mormon polygamists give up their extra wives.

The most curious feature of the anti-Mormon crusade has been pointed out by Mr. James W. Barclay, an English member of Parliament, in the *Nineteenth Century*. He maintains that the hostility to the Mormons among Americans is in the inverse ratio of knowledge of them. The further East he went the greater he found it. He was deeply moved by the wonders wrought in the Utah Valley by Mormon industry, and by the beauty and comfort of Utah villages compared to the ordinary Western settlements elsewhere. He says that "the government of Utah by Mormons might be accepted as a pattern by many other States in the Union"; that "in no State or Territory are the taxes so moderate"; that there is no bonded debt in the Territory except $35,000 issued to build an irrigating canal; that the people have built 10,000 miles of irrigating canal to make their soil capable of the abundant productiveness which now characterizes it; that they are "tolerant, temperate, peaceable, and industrious"; that although the great bulk of the population is Mormon, in the city prison in 1881 there were 29 convicts, and in the county prison 6 convicts, but only 9 of them Mormons. In the penitentiary there were 51 convicts, but only 5 of them Mormons, and of these 2 were there for polygamy. Out of 125 prisoners in the lockup, 11 only were Mormons, and some of these for polygamy. The returns of arrests in Salt Lake City in the same year showed 169 Mormons against 851 Gentiles or Christians. Polygamy, Mr. Barclay insists, is already rare, and must die out soon altogether, and he denounces the Eastern fury against the Mormons as ferocious, and ignorant, and unreasonable, if not Pharisaical. This may be a rosy view, but it is worth consideration. A people who have done what the Mormons have done are not a worthless lot with whom it is vain to reason, and who can only be reformed by being knocked on the head.

THE SOCIAL MOVEMENT IN ENGLAND—II.

LONDON, December 22.

AT the basis of the social movement in England lie (as I pointed out in my last letter) two ideas. The first is the sentiment that it is a public duty to insure to all classes of the community a fair share in the material benefits, and even in the pleasures, to be derived from the wealth of the nation; the second is the conviction that the nation can best perform this duty by using the power of the state for the regulation of matters which in England have been hitherto managed by the free and voluntary action of individuals. If any one likes to say that these ideas savor of "socialism," I do not know that he will be far wrong. But it is not my purpose, at the present moment, either to attack or to defend notions which, whether false or true, or (what is more likely) partly false and partly true, assuredly exert great influence. I note their existence, and try as far as in me lies to trace out the causes or conditions of their prevalence. To do this with perfect success would be to account for the growth of what I have termed the social movement. Of achieving such success I have myself no hopes. All I hope to do is to call the attention of your readers to some few of the conditions of a noteworthy state of public opinion. I shall, for to-day, confine myself to the inquiry, What are the circumstances which have, in the England of to-day, aroused among the well-to-do classes an unwonted and, as far as English history goes, unprecedented interest in the welfare of the poor?

Before I attempt an answer to this inquiry, let me once more impress upon your readers the

existence of a condition of feeling which needs explanation, and which has not attracted all the attention it deserves. It is not a speculative view, but a matter of plain fact, that the present generation of Englishmen, and still more of Englishwomen, are influenced by a desire—in some cases amounting to a passion—for extending among the poor and the helpless the benefits and joys of civilized life. Any sceptic who doubts this should note with care many trifles which, just because they are trifles, are the straws that show which way the wind blows. Of these significant facts the approaching Bank holiday is one. This is an age of pressure. Teachers of all kinds warn us, with more or less reason, against over-work and against over-competition. Yet this busy, overpressed, excited generation have been the first generation of Englishmen to realize the necessity of securing holidays for every class of worker. The Bank holidays are merely the largest and most obvious of the many hours or days of rest which the benevolence or the public spirit of the wealthy have procured for the mass of the people. Any one who observes the habits of private families will admit that there has, during the last forty or fifty years, grown up a new feeling as to the amount of recreation and of holidays which ought to be provided for servants. Any stranger who walks through the streets of London or Manchester on a Saturday will find, often to his considerable inconvenience, that the Saturday half-holiday is in many trades becoming a custom enforced by opinion with the inflexibility of law. But this care for the repose and recreation of large classes is, for the present purpose, not by any means so striking a phenomenon as the various efforts made, often in rather unexpected quarters, to cast some ray of happiness over the dull or miserable lot of the children of the city poor. The society for giving dinners to poor children; the proposal advocated in the papers of a day or two back by Mrs. Westlake—certainly as practical and sensible a reformer as you can find—for providing rooms and amusements for infants who are necessarily left uncared for while their parents go out from home to obtain a scanty livelihood by hard labor, tell their own tale.

Let no one say that benevolence has always existed in every Christian country. The point to notice is, not the existence of benevolence, but the form in which it exists. There have been good men and good women in all ages who have wished well to their fellows and have labored for their benefit. The proportion, indeed, of such persons to the whole of society has considerably varied, and is, one may suspect, a good deal larger now than heretofore. But what is really new is, that benevolence has taken the shape of attempts to increase not only the comforts but the pleasures of the poor; and, further, that this sympathy with the miseries of poverty displays itself in quarters in which you would in vain have sought for it in other ages. Take, for example, the zeal with which the editor of *Truth* collects and spends money on presents of toys for children who, but for him, would probably have never known more of a toy than can be learned by peering through the windows of a toy shop. A cynic might suggest that the proprietor of *Truth* only follows the fashion. The suggestion would be, as far as my present argument goes, irrelevant: fashion, like hypocrisy, is a tribute to genuine feeling. But the suggestion would also, in all probability, be grossly unjust. I have no acquaintance with Mr. Labouchere; I am no admirer either of his politics or his paper. But I cannot see the least reason to suppose that a genuine pleasure in the joys of children, and a genuine wish to lighten up the lives of poor children, is not the actuating motive to exertions which must bring the blessings of many uncared-for little boys and girls on a paper which has probably not been overmuch blessed by any one else. Look at the matter from whatever side you will, the presents made by *Truth* are worthy of note. That now dull and respectable paper, the *John Bull*, held some sixty years ago or more a position not unlike that of *Truth* and the *World*. Theodore Hook was not, one may suppose, a personally ill-natured fellow; yet does any one think it possible that a hunt through the files of the *John Bull*, while under his editorship, would reveal a single appeal for means to provide Christmas gifts for the children of the poor? It is surely a sign of the times when the editor of a society paper seeks to imitate Jean Valjean, and give to a poor child his or her first taste of the joys of childhood.

The name of Victor Hugo recalls one main influence which has contributed to produce the state of feeling that I have tried to indicate or describe. If we seek for the source of the constantly increasing sympathy with the poor, we shall find it, to a great extent at least, in the general growth and development of the sympathetic sentiment throughout modern European society. And this turn of feeling has been at once stimulated and represented by the literature, and especially by the fiction, of the last half century. Here, as in other cases, the effect of a long course of teaching is most visible when the teachers have passed away, and when possibly modes of thought opposed to theirs are beginning to exert a new ascendency. Victor Hugo survives, but has not left a successor. Dickens, Thackeray, George Eliot, Charlotte Brontë, Mrs. Gaskell, Trollope are now names of the past, and it cannot be said that the noble school of English novelists is now represented by any one who rises above respectable mediocrity. But these authors and others whose names will occur to your readers, though differing in many respects, have all at bottom agreed in one point: they have all preached a gospel of sympathy. It is hardly an exaggeration to say that with George Eliot the merits and demerits of man and woman were judged of wholly by the one test, whether he or she were able to feel for the woes and joys of others. It would not be hard to establish that this appeal to feeling which characterizes the fiction, is also a chief feature in the theology and in the ethics of the last half century. There is no author to be found who obviously desires more truly to base his moral views on fact and on science than does Mr. Leslie Stephen; yet the moral impressed upon readers by his 'Science of Ethics' is the duty of sympathy, and that, as far as man is concerned, love is the strongest force in the universe.

Nor can it in truth be said that the tendency to exalt feeling, and especially sympathetic feeling, has been opposed by any class of writers who have exerted wide influence. Carlyle looks, at one's first glance, like the resolute assailant of all sentiment or sentimentality. But he denounces one kind of feeling only by giving prominence to another. He does not urge or naturally lead his readers to trust in reason or in knowledge. He is at bottom more truly a sentimentalist than George Eliot, and quite as truly as Dickens. In truth, the admiration of Dickens for Carlyle, and Carlyle's appreciation of Dickens's gifts, are something much more than a mere trait of literary biography. They show how slight was the essential difference between the different forms in which the sentiment of modern England has displayed itself. Dickens did Carlyle's 'Revolution' into melodrama and dubbed it the 'Tale of Two Cities.' Carlyle was never weary of attacks on administrative routine, which were all summed up in Dickens's one expression, the "Circumlocution Office"; and there is nothing in the political economy of 'Hard Times' which was not concentrated by Carlyle into the nickname of the "dismal science." These two eminent writers represented and intensified two sides of what was really the current feeling of their age. They each, in common with a score of other more or less unconscious fellow-workers, promoted the development of sympathy. Their work has lived after them, and one may fairly assert that the existing generation of men and women in England have a capacity for entering imaginatively into the feelings of others (combined, unfortunately, with an even greater capacity for analyzing their own feelings) which hardly existed a hundred or even fifty years ago. If any one doubts this, let him study Fielding or Richardson, or Scott or Miss Burney, or Miss Edgeworth or Miss Austen. If he will go candidly through the not very unpleasant task, he will, I venture to say, easily conclude that while in genius, or even in talent, modern Englishmen are, to say the least, not a whit in advance of their fathers or grandfathers, modern Englishmen have developed a capacity for sympathetic emotion which was unknown even to the most imaginative of past generations. My student will also perceive that in nothing is this new gift or capacity more visible than in the altered attitude of English society toward the poor. The side of modern feeling, in short, is one phase or exhibition of a general mode of sentiment.

Another, though subordinate, cause of the widespread belief that all members of the community have a moral right to share in the material comforts of life, is to be found in the character of modern theological and religious teaching. It is easy to understand how it happens that many persons of education consider this to be an age of theological scepticism; but whoever looks facts in the face will, I am convinced, come to the conclusion that, whatever may be the ultimate issue of the long battle, of which no one living will see the end, between orthodoxy and scepticism, modern Englishmen are, in matter of fact, deeply influenced by religious and theological ideas. Now, nothing is more clear than that English theology has in one respect undergone a change or transformation. There probably is no clergyman or minister of any school who, whatever his beliefs as to the next world, does not attach a moral importance to the material conditions of life in this world which had hardly pressed itself upon the minds of the religious teachers who, at the end of the last, or the beginning of this century, moulded the moral aspirations of Englishmen. There has been a great deal of exaggeration in the charge of "other-worldliness" brought against men whose highest thoughts and strongest feelings were centred on the prospects of man in the next world. We should never, in common justice, forget that in England plans of practical benevolence or of extended philanthropy were forced upon the world mainly by men who were thought, by themselves and others, to be wholly occupied in saving men from ruin in the next world. But it cannot be doubted, nor is it in any way to the discredit of religious teachers, that the theological leaders of past generations did not look upon life in this world in the same light as do their modern representatives. To "speak as dying unto dying men" may have been a fair description of preachers who, even when trying to amend what was wrong in this life, were oppressed with the one thought, that their hearers must at all costs be saved from eternal perdition. It certainly is not a fair description of even the most orthodox among modern English theologians. The world has changed, knowledge has advanced, and theology has

changed also. This fact is important. When clergymen are occupied with filling the ranks of the Blue Ribbon Army, and with other schemes of practical improvement, it is impossible that their teaching should not stimulate their hearers to go and do likewise. To this must be added the weighty consideration that sceptics or agnostics constantly claim, and no doubt with truth, to share in the benevolence, the charity, and the so-called enthusiasm of humanity originally aroused by religious or theological doctrines. By a strange, though perfectly natural, turn of opinion, men who disagree on what appear to each of them vital questions of theological or anti-theological belief, find that they can act and feel together when engaged in works of practical benevolence. The secularist who holds that men must make the best of the only life they will ever have, and the orthodox clergyman who believes that to spend life well and virtuously on earth is the best way of preparing for life in another world, are each impelled to aid every scheme for improving the dwellings of workmen or for increasing the innocent pleasures of the poor.

The spread of democratic institutions, and notably the extension of the franchise, have been one undoubted cause of the interest taken by all classes of Englishmen in the condition of the people. But it would be a mistake to attribute too great an influence over opinion in England to any merely political arrangements. Constitutional changes have their importance—an importance which some writers and thinkers decidedly overrate; but, after all, the institutions of a country are on the whole the effect rather than the cause of the sentiments or opinions which prevail there. This certainly is so in England; it is far more true to say that the Constitution is becoming democratic because Englishmen of all classes are keenly alive to the rights and claims of the people, than that modern Englishmen wish to improve the condition of the people because the Constitution is democratic. The ten-pound householders and their leaders might, I am convinced, have resisted the agitation for Parliamentary reform in 1867 if their own sentiments had not become democratic. Even as it is, an impartial observer may doubt whether the political power of the working classes is now, or will be when household suffrage prevails throughout the country, nearly as great as it would appear to any one who studied only Acts of Parliament or electoral statistics. The advance of democracy tells on English life mainly by its indirect effects. Classes whose voice cannot be heard are neglected not because they are disliked or because any one wishes to oppress them, but because their existence is forgotten. When the mass of the people have votes, the rich and well-to-do begin to realize that the people exist; and in modern England to know that a class exists is with many among the rich (for reasons I have already explained) a sufficient reason for sympathizing with their sufferings, and for wishing to remove them.

A. V. Dicey.

IRISH LOCAL GOVERNMENT.

Dublin, December 29, 1883.

The local government of Ireland, which now claims our attention, is a wide and complicated subject. It can be treated in but a cursory manner within the limits of this letter. The fullest and best information thereupon will be found in a work entitled 'Local Government and Taxation in the United Kingdom,' one of the Cobden Club Series for 1882. The County, the Poor-law Union, and the Town are the chief Irish administrative areas. It must be clearly borne in mind that the control of the police, education, and other similar important matters is centred in Dublin Castle, independently of Irish representative bodies, and that the Castle regulates, more or less, such functions as remain to them.

Ireland is divided into thirty-two counties, and these again into 325 baronies. The baronies — older divisions, I believe, than the counties—are of irregular areas, and vary in number from twenty-three in the County of Cork to five in the County of Leitrim. The principal local authority in the county is the Grand Jury. It is appointed before spring and summer assizes by the High Sheriff, who has been nominated by the Lord Lieutenant, from a list prepared by previous judges of assize. The Grand Jury consist of twenty-three gentlemen. The Sheriff is bound to choose from every barony a resident £50 freeholder or £100 leaseholder. He then completes the required number, at his discretion, from the £50 freeholders and £100 leaseholders of the county. In most of the counties, the number of baronies being under twenty-three, he has a wide discretion in selecting the majority. Regard is had principally to wealth or status.

Baronial presentment sessions play a subordinate part in the administration. Every magistrate in the county is entitled to attend and take part in the proceedings of these baronial sessions; but it is not etiquette or "good form" for any but the magistrates of the barony to do so. With them sit six or eight "associated cess-payers," chosen by the magistrates at the previous assizes from a list of the highest-rated cess-payers of the barony. One associated cess-payer is sent forward from each barony to sit with the county Grand Jury. The method of choice is tortuous, the ballot takes place on the day of sessions, and as the farmers are little disposed to travel far, on the chance of success in a ballot which would only give them a nominal part in the affairs of the county, the justices, usually men of leisure, have the whole business practically in their own hands.

The *personnel* of the Grand Jury is liable to considerable change each assize. It has no power when out of session. Conscientious consideration of the affairs of the county is out of the question, crowded as it must be into a few hours twice a year at the spring and summer assizes. (There are eight or nine months between the summer and next spring assizes.) Some 360 days of the year the paid officers have the affairs of the county practically under their complete control. There are, to be sure, certain checks. In case of emergency—the breaking down of a bridge, or the like—any two justices can order work to be done. Cess-payers are allowed right of appeal; but the judge has neither the special knowledge nor the time wisely to decide in such matters.

It will be remarked the part which the magistrates—practically chosen by the crown—play in this system. There is no suggestion of peculation; but it is inevitable that the interests of the many who pay the taxes (cess) should be neglected for the interests of the few. Thanks to the influence of public opinion and the press, there are fewer evils to complain of in this respect than there used to be.

This extraordinary system of Irish county government is one of the scandals of Irish administration. Its injustice and evils have been acknowledged for the past forty years. For the past twenty years Liberal and Conservative governments alike have held out hopes of radical reform. That the over-charged Imperial Parliament has never had time to grapple with and attend to it, is a strong argument in favor of some kind of Irish assembly for the regulation of Irish affairs. The wonder is that the system works even as well as it does.

The Grand Juries in 1879 dispensed £1,270,000. The annual amount has not fluctuated much within the past ten years. Two thirds of this sum was for county works, much of the rest being levied for purposes regulated by statute or by the Castle. The Grand Jury exercises discretionary power as to contributions to reformatories and industrial schools. Railways are sometimes aided by baronial guarantee. The projects for extending tramways over Ireland under the act of last session, entailing as they do possible county charges, require the approval of the Baronial Sessions and Grand Jury before passing up to the Lord Lieutenant for final sanction.

Every person in Ireland, as in England, has a right to poor relief in a workhouse, and to medicine and attendance if too poor to pay for them. This system is worked by Unions. There are 163 Unions in Ireland. Neither county nor barony has any part in their organization; the local authority of the Union is a Board of Guardians. The Board of Guardians is composed of an elected and an ex-officio element. The Local Government Board (practically the Lord Lieutenant) determines the number of elected guardians for each Union, and their qualification. Justices of the Peace, equal in number to the elected guardians, form the ex-officio element. The Local Government Board can substitute paid guardians for a board that has failed to do its duty. This power does not appear ever to be overstrained. Besides the control of the Union workhouse, the Guardians administer outdoor relief, medical charities, boarding out of pauper children, and sanitary acts. In face of the defects of the Grand Jury system of county government, almost every Government department utilizes them. The local Government Board rule minutely and absolutely over their proceedings. The arrangements of the workhouses are painfully denominational. The Catholics and Protestants are divided through almost every department like two hostile races of animals in a menagerie. This is extremely embarrassing and expensive. Some time ago a guardian, a friend of mine, told me that in going through the Protestant children's ward of the South Dublin Union he was shocked to find a painful case of idiocy among the children. Upon asking why the poor creature was not in the idiot ward, he was told that the other idiots were Catholics, and that it would not do to have him with them! The introduction of nuns and Protestant "sisters" as nurses in many of the Union hospitals has had the best results. Poor-relief and medical charities, which, upon the establishment of the system in 1838, were calculated would cost £300,000 per annum, rose in 1849 to £2,061,000. This amount fell steadily to £525,000 in 1859. Since then the rise has been steady to £1,237,000 in 1882. This increase of expenditure, in the face of a diminution of 3,000,000 in the population, is due partly to more extended ideas of the requirements of life, even in a poor-house. In 1874, the average daily number of inmates in Irish Unions was 47,000; in 1881, 54,000. This year they have fallen to 51,000. The cost of out-door relief has increased from £5,500, in 1860, to £181,000 in 1882. The average number of persons in receipt of out-door relief rose from 30,000 in 1874 to 61,000 in 1881. It has fallen this year to 59,000. There is something ominous in these figures. Ireland has fewer paupers in proportion to population than England. Taking an average of five years ending 1880, while in England and Wales one person out of every thirty-four of the population was in receipt of poor relief, in Ireland the proportion was one out of every

fifty-four. But in this respect we are going down hill. Eight or ten years ago the proportions were: England, one in twenty nine; Ireland, one in sixty-seven. The change here is largely due to the increase of out-door relief. Poor relief costs the people of England seven shillings per head of the population; it costs us four shillings per head. In 1876 the figures were six shillings, and three shillings and fourpence respectively.

The cities and towns in Ireland are under the charge of Elective Corporations or Town Councils. Their powers are, as I have already intimated, much restricted as compared with the powers vested in similar bodies in Great Britain. So long as the police are free from the control of the municipality, it is found impossible to depend upon their vigilance and effectiveness in enforcing the rules and regulations of the municipality. The Lord Mayor of Dublin has no more immediate control over the police of the city than an American visitor has. The expenditure of the city and town authorities in 1879 was £770,000. It is here, as perhaps everywhere else, steadily rising. In 1870 it was only £556,000. The expenditure in Dublin is £328,000, or twenty-six shillings per head of the population. The Dublin debt is about £1,000,000, £750,000 of which was spent on securing a splendid water supply. The total debts of the Irish cities and towns amount to £2,524,000.

It is not necessary here to enter into the minor local-government organizations—lunatic asylums, Harbor Boards, Drainage Boards, Inland Navigation Boards, and the like. The members of these boards are to a considerable extent nominated by the Lord Lieutenant. Their powers are limited and supervised. The Dublin Port and Docks Board, for instance, which has within the past sixteen years raised the port of Dublin from being of minor importance to that of almost a first-class port, with twenty-four feet at low water, and which has more than doubled the tonnage of the port within that period, is empowered to appoint some dozen police constables with jurisdiction on the quays. The selection of each of these men has to be submitted to and approved by the Lord Lieutenant; and a pension of even 2s. 6d. a week to an employee must be sanctioned by him.

A review of the Irish franchise and local government shows how very little direct power an Irish citizen has over the institutions among which he lives. If he possess the necessary qualifications, and have passed the ordeals of registration, he may vote for one or two members of Parliament every three or four years—for a city or county coroner once in a lifetime; for poor-law guardians every year; if resident in a city or town, for town counsellors each year. These are practically all the votes he can cast. If a wealthy man, he may, in a port like Dublin, have a vote for representatives to a harbor board. One of your election tickets is here a scrap-book curiosity.

The general character of almost all the Irish representative bodies has, under the influence of political events and tendencies, greatly altered of late years, wherever Catholics and Nationalists are in the majority. "Suspects" are now in the majority, and occupy the most influential positions on many Town Councils and Boards of Guardians. It remains to be seen whether they are upon the whole less devoted to the honest and sympathetic discharge of their duties than the former class of representatives. A great outcry has been raised at the change in the constitution of the Dublin corporation; but certainly its management of affairs is much better than in the old times, when "respectability" was all-powerful. The number of publicans (bar-keepers) in the representative bodies is to be deplored; they compose nearly one-third of our corporation. But if others will not, as they might, come forward to represent the people, the publicans cannot be blamed for doing so. This state of things cannot continue. The prognostication that the present class of representatives would be less sympathetic toward the poor, and less inclined to tax themselves for their benefit, than were the former representatives drawn from a higher rank in society, has so far been shown to be without foundation. Interesting statistics have lately been published as to the extent to which has been used the recently acquired power of imposing burdens upon the rates for the erection of better houses for the working classes. These statistics show that precisely in proportion as the various Unions are in sympathy with the people, although not directly elected by them, these burdens are readily—sometimes too readily—undertaken.

The Castle control over our local representative assemblies has some advantages which I trust may be continued under whatever Irish control eventually supersedes it. There is a perfect system of audit of accounts of local bodies, and malversation of public money is almost impossible. Everything must be bought under contracts which are publicly advertised for.

The discussions of the Town Councils and Boards of Guardians cannot be kept free from politics, which upon occasions interfere with the progress of business. One of the necessities for some central Irish representative body is that its establishment would leave an opening for the discussion of public questions, and would tend to eliminate their consideration from county and city affairs.

The Imperial Government contributes some £2,400,000 per annum toward the local expenditure of 5,200,000 Irishmen—medical officers, £73,000; pauper lunatics, £82,000; prisons and reformatories, £221,000; prosecutions and law costs, £87,000 (much more than this at present); police, £1,235,000; education, £571,000, and so on. The cost of the "extra police," which the Lord Lieutenant has the power to send to any part of Ireland, is a direct and often a heavy charge upon the district. These large contributions toward Irish local expenses are, unconsciously perhaps, part of a system of bribery to make the Irish people content under the present system—local burdens paid, loans for the improvement of land and for public works, for glebe houses and for schools, at low rates; an unnecessary number of judicial and legal offices. No one who desires the true strengthening and elevation of a people can wish for a continuance of such a system; but I sometimes wonder whether, when the real facts of the case, the real responsibilities necessitated by a change to a better system, are realized by the Irish people, they will rise to the occasion, and not prefer the flesh-pots of irresponsibility to the cares and obligations of local self-government. I cannot find that much more than £2,901,000 is contributed to the local burdens of 26,000,000 Englishmen. It is, therefore, evident that the first effect of Home Rule would be the increase of the direct fiscal burdens of the Irish people. Imperial taxation is in the main indirect. A moiety is derived from taxes on intoxicants and tobacco, which are not necessaries of life. Local taxation is paid in hard cash.

Searching in vain for facts as to the amount of imperial contributions toward Scotch local expenses, in an essay by a Scotchman upon local government in his county I read the following paragraph:

"People who have had experience of local business, and are in the habit of discharging responsible duties to their fellow men, are calculated to take a more sympathetic and enlightened view of national affairs than they might otherwise be able or inclined to do. Trust of this nature serves to deepen one's interest in the country and its business, and affords opportunity for the cultivation and development of faculties which otherwise might be latent, and often prove of great service in the administration of national affairs. Equally emphatic is the feeling in Scotland against the removal of much more of the local burdens to the national purse. This, in my humble opinion, illustrates the good sense of the people. Those who advocate the transference of one tax after another from local to national resources, seem to labor under the belief that by such a change they will obtain relief to their pockets corresponding to the amount of the taxation handed over. That, however, is a delusion."

I wish we could be sure of the prevalence in Ireland of such enlightened sentiments regarding the incidence of local burdens. D. B.

SCHERER ON DEMOCRACY IN FRANCE.—II.

PARIS, December 11.

M. SCHERER has shown the influence of the electoral interests to be the prevailing influence in the country. And these electoral interests can hardly be considered as general interests; as happens in countries where two opposite parties are strongly organized, they are narrow and personal. Some of the examples he gives must be cited. "Is it true," he asks, "that with universal suffrage and all its weight upon the deputy, a war—the most just and necessary war—has become impossible? Has the reduction of the military service to three years, which people speak of introducing in France, the interest of the army for its object, or the interest of the elector in the abolition of taxes?" The law on the magistracy, which has momentarily suspended the irremovability of the judges, was also dictated to Parliament by electoral interests. In vain did the Government attempt to seize this opportunity to diminish a certain number of the courts; it is obvious that the number of these courts and the number of the judges in each court are quite out of proportion to the needs of justice. "Those," says M. Scherer, "who had this very simple idea had forgotten that they had to deal with the deputies of the arrondissements, and that these deputies would upset ten governments rather than subordinate to the public good considerations of local advantage and of personal interests." The obnoxious judges have been removed, but the useless courts and judges have been carefully preserved. The electoral interests have also imposed, on the state first and afterwards on the great railway companies, the construction of an immense number of small railway lines, which are at the same time very costly and, for the present at least, very useless. The first thing a deputy promises to his arrondissement is a new railway. The famous plan of public works of M. de Freycinet, who had merely adopted all the lines promised by all the deputies, has been a lamentable failure. The state began to construct these new lines and to work them, but after a while it was proved that the state was entirely unfit for such an enterprise. Negotiations were opened with the existing companies, but they were opened too late, and they have ended in agreements which will saddle a very heavy burden upon the budget for years to come.

The electoral interests have been so exacting, so selfish, so unscrupulous, that the financial situation of France, which, a few years ago, was shown with an air of triumph to the whole world, has now become a serious subject of

alarm. Every deputy wants to grab something from the budget. "Apparently," wrote Léon Say some time ago, "the problem which many deputies wish to solve is this: How shall we make our departments, our communes, even our electors, live at the expense of the state?" And he added: "It is singular to see the nation send to the seat of government agents of incitement to expenditure." Public opinion cannot yet understand that to incite expenditure is to force an increase of taxation. The life of a minister is a continual struggle against thousands of placemen, hundreds of senators and deputies. A humorous deputy has lately given an account of his own life. An elector writes to ask him to procure a nurse for his new-born child; another tells him the symptoms of his malady, and begs him to consult a great doctor of the capital; hundreds of them ask for tobacco licenses; many deputies are obliged to pay secretaries in order to answer all the letters addressed to them, for the elector will at least have a letter from "his" deputy. The *République Française*, in its number of the 12th of April, 1882, cites a letter of an elector who asks his deputy for a silver watch, "as a token of his noble and benevolent person." It is needless to say that the senator or deputy must send his photograph to a number of his constituents.

What are the tendencies of a government founded on universal suffrage, unbridled, absolutely free and untrammelled? The people in such a democracy are always led, but the leaders can only lead by obeying and understanding the most profound and persistent popular instincts. We must, therefore, ask ourselves, What are these instincts? The verdict of Scherer on this point is severe. In his opinion, democracy can only appreciate material work. It looks upon those who use the pen, the word, the weapons of the intellect, as privileged beings. It can only appreciate mediocrity, to which it is condemned. It has the passion of simple and absolute ideas, which are sterile ideas. It does not feel the necessity of time, of reflection, of custom, of duration: it cannot understand that anything should interpose itself between its desire and the satisfaction of it—between a decision and its effects. It is, in this respect, childish, feminine, irrational. It is essentially antagonistic to liberty, because liberty supposes the free development of inequalities, and democracy abhors all inequalities. It tends to deprive the executive power of all force and all initiative.

"I will never cease to repeat it," says Scherer, "if the sovereignty of the people does not succeed in finding a basis of authority; if it does not derive from itself a force of resistance and a government capable of governing; if democracy, in other words, does not succeed in limiting itself, it is condemned to disorder. And, as society does not long support disorder, democracy is condemned to accept the first saviour who presents himself." Scherer goes so far as to adopt the opinion expressed by Macaulay in 1837, in a letter addressed to a biographer of Jefferson: he thinks, like the great English historian, that the masses, composed of men who have to gain their daily bread by hard labor, and who are occupied chiefly with the hard conditions of life, are not fit to take care of the general interests of a country and to solve economical problems. So far, the dark prophecies of Macaulay have not been accomplished; but we must never forget that the American Republic has found in its Constitution, in its Federal principle, in the absence of any powerful centralization or bureaucracy, those forces of resistance which counteract the blind force of democracy. I will also add that America, owing to these conditions, has not, as yet, shown that love of intellectual mediocrity which seems to Scherer to be one of the conditions of the democratic state; there is hardly a country where intellectual excellence and greatness are more valued. Democracy, in Scherer's opinion, tends perforce to socialism; and socialism, as it is the means of taking away from those who have in order to give to those who have not, is merely a new form of spoliation and of conquest. Force is not necessary to it; legal means can be employed. It is true that in France property is very much divided, and caution will be necessary. Still, the state will tend to become by degrees the arbiter of wealth; it will give work to those who have no work, it will play the part of Providence. Scherer asserts that democracy is making great progress in England, and finds a proof of it in the agrarian law made for Ireland, and in the extension of out-door relief, which he considers a means of propagating improvidence and idleness.

Democracy is not its own end; it is a form which calls for something to fill it—a force which tends to some application. In Scherer's opinion, a democratic form of republic tends inevitably to the levelling of fortunes, and is condemned to make a trial of communism in some shape or other. He does not believe, however, that the laws which regulate labor and property can be changed, and socialism can never be anything but a colossal and unfortunate experiment. If democracy abandoned itself to its instincts, its programme would be this: "To hinder the intellectual capacity from asserting itself, for fear of its ascendency; not only to strike at acquired wealth, but to make it impossible to reacquire wealth, for fear of its power; to establish the uniformity of social conditions, to the profit of the feeble, the mediocre, the vicious, and consequently to the detriment of force, intelligence, and morality." If this really be so, it becomes imperative for democracy to vanquish its low instincts, as it is imperative for the individual man to control his passions. We cannot arrest the current of democracy; we may hope to regulate it. We must find in democratic institutions some guarantees against the ignorance and the impatience of majorities. These guarantees are well known: they are the division of powers, repeated deliberations for all important laws, the control of a Higher Chamber in which other social elements than mere numbers are represented. I should be disposed to add to these, in a republic, the independence of the Ministers, and the constitution of a Cabinet more directly connected with the responsible President than with the Chambers themselves.

Democracy must also have as much regard for the highest culture as for the education of the people. As Scherer says:

"It pursues a high object in proposing to itself the good of the greatest number; but it is possible that it will only obtain this levelling at the price of universal mediocrity. If the universal *poule au pot* is decidedly better than the truffled fowl of the privileged, the elevation of the level of general instruction is not a perfect compensation for the loss of the literary and artistic culture of the great epochs; nor are the benefits of popular government an absolute compensation for the government of the most capable and of the best. I imagine that it will be hard for humanity to do without great men."

Science is progressive; morality is not. Egoism remains the foundation of human character, and democracy will not alter man in this respect. It is long since Renan said that he could imagine a society in which man should be admirably fed, clothed, warmed, lighted, and in which, nevertheless, he would be very miserable. The discoveries of science may even tend to lower humanity, in so far as they give an artificial life to those who would naturally have been rejected. Charity, philanthropy, chemistry, medicine, drainage, all the improvements, all that softens and beautifies existence, tends in one sense to contaminate the race. What is done for the individual man is not always done for the species. "Who tells you, leveller, that your levelling brings you up, and not down? The consumptive, the scrofulous live, but humanity suffers by it. The ignorant, the lazy are electors, but the state suffers by it."

These are hard words; they are a sort of protest by an aristocratic mind against democracy, and the protest is all the more bitter because this aristocrat is a servant of democracy. This philosopher, bred in Calvinistic ideas, who cannot divest himself of the notion of the fated inequality of men, who believes neither in liberty, as the democratic school conceives it, nor in equality, nor in fraternity, is enrolled under the banner which bears the words: "Liberty, Equality, Fraternity."

Correspondence.

CARLYLE'S VISIT TO GERMANY.

To the Editor of The Nation:

Sir: The opening sentence of your review of Japp's 'German Life and Literature,' in the issue of the *Nation* for January 3, 1884, gives fresh currency to an oft-repeated erroneous statement concerning the life of Thomas Carlyle. Your reviewer writes: "Two generations have passed since Mr. Carlyle, having gone to Germany and 'found what he wanted,' returned home and commenced scourging his countrymen for their dislike of what was currently known as German vagueness and transcendentalism." Permit me to point out that Carlyle made only one visit to Germany, and that was in 1858, when he was sixty-three years of age, and after all his great works, except 'Friedrich,' had been written. Shortly after his death the statement that he had visited Germany in his youth appeared in various notices of his life, and was widely circulated. The author of an article in the issue of the *Nation* for February 17, 1881, wrote: "The fact seems to be—and it is an extraordinary fact—that it was not till he went to Germany, when he could not have been far from thirty years of age, that he developed any originality."

The recurrence of this statement in the pages of the *Nation* induces me to point out that it has no foundation in fact. D. H.

Washington, D. C., January 7, 1884.

[We stand corrected; but, for our immediate purpose, the *intellectual* "going to Germany" was the pertinent fact, and was really in our mind when we intimated a bodily journey.—Ed. Nation.]

THINGS SPANISH.

To the Editor of The Nation:

Sir: Your review of "Books on Spain" interests me, as it was my good luck to spend some two months travelling in Spain in the spring of '80. As a guide-book I used O'Shea's, and think it the best guide-book I have ever seen, having used Murray's, Baedeker's, Black's, and some French books. I was most impressed with the coast scenery from Gibraltar to Malaga, going by boat, and the scenery around Malaga is the finest I ever saw. Apropos of a recent article of yours on a new translation of Scott into French, and your remarks on the popularity of Scott and Cooper on the Continent, the first

thing that drew my attention, under a low, dark arcade on the Square at Pampelona, was a set of books, 16mo, which looked old enough to be Loyola's copy of 'The Lives of the Saints,' but which proved to be a translation of Scott. They were the only books in this curiosity shop. At Seville I found an English edition of Cooper, as well as translations. There is scarcely a town in any of the Latin countries of Europe in which odd volumes of Scott and Cooper cannot be found. The best description of the bull-fights is that by Th. Gautier in his 'Voyage en Espagne.' Such, at least, was my conclusion after reading all the descriptions I could find at Mudie's, and after having seen the bull-fights in honor of the Queen of Spain, when she was found to be "en estado interesante." A.

January 8, 1884.

THE MORMON PROBLEM.

To the Editor of The Nation:

Sir: The United States Government having unsuccessfully tried every possible form of legal enactment to suppress Mormonism, please permit me to suggest that it would be well to adopt a thorough change of tactics. Petty persecution has never been successful; and, unless the Federal Government is prepared to kill the Mormons outright, it would be wise to refrain from irritating legislation. The Mormon women do not seem to feel oppressed; they will not avail themselves of the laws passed for their relief, and they appear to be satisfied with their lot, which is, perhaps, better than what most of them are accustomed to in Europe.

I would suggest that Government should establish milliners' shops throughout the Territory of Utah, where dresses could be cut and fitted at a moderate price to commence with. After the milliners get hold they may be left to themselves. Bonnets, and not bayonets, are the true persuasives for women. French milliners in all the small towns, and the latest fashions in the windows, would appeal to the weak side of the feminine heart. French boots are very eloquent. Let the lower terminations of Bishop A's latest acquisition be once clothed in elegant "bottines," and the venerable saint's purse will begin to feel the coming change. All his tender spouses will demand boots and bonnets, or else turn in utter wretchedness to the law for relief from marital injustice and oppression. Then, of course, Elder B and Apostle C will have to follow suit. If the Congress were not composed entirely of the stupider sex, this method would have been thought of long ago. What do women care for laws? They do not take the trouble to read them. They have as much respect for statutes as a New York belle returning from Paris has for revenue laws. Many of us in the East have to abstain from even one wife because of the expense of dressing her. It is in the atrocious plainness of their wives' dress that the Mormon men have the pull on us. Cannot some of our milliners be sent out West to equalize matters a little, so that we all might have one wife at least? If these Mormon elders once get into a struggle with the milliners, they will begin to economize, and cut off wife after wife, just as a man stops his periodicals in hard times. There is the true solvent for polygamy. A few women delegates—Congresswomen—would have seen it long ago. A Constant Reader.

Quebec, January 8, 1884.

To the Editor of The Nation:

Sir: Those of our religious teachers who are in favor of resorting to the army as a means of solving the Mormon problem I had supposed were hardly considerable enough, either in numbers or influence, to justify the few references to their sayings and doings to be found in the columns of the *Nation*. But that sentiments of violence toward our polygamous population are not confined to a few eccentric and irresponsible guardians of public morality, the following facts may serve to show.

In the *Christliche Apologetik*, the official organ of American German Methodism, of the date of December 31, there is a report of the proceedings of a District Conference of German Methodist Ministers, held a few weeks previously in Le Sueur, Minnesota. Among the questions discussed at this Conference was that of the "Duties of Christian Citizenship." The leading speaker upon this theme said, with the apparent approval of his reverend auditors:

"Dieser ist ein eiterndes Geschwür auf dem Rücken dieser Nation, das wir mit dem Schwerte abhauen, und mit Pulver ausbrennen sollten."

That any of our German brethren should retain the sword as an agency of moral reform, is all the more remarkable when it is considered how the average German-American insists on his right to follow social customs palpably at variance with the genius of the land of his adoption. Geo. M. Fortune.

Virden, Ill., January 6, 1884.

THE STUDY OF DIALECTIC GREEK.

To the Editor of The Nation:

Sir: Had those who teach Greek the same end in view as that proposed by teachers of the modern languages, viz., the attainment by their pupils of a ready use of the spoken tongue, and were the spoken tongue to be acquired the classical Greek, there would be no objection to the change "E. M. S." proposes in methods of instruction. Conversely, if a teacher of German aimed at making his pupil familiar with the literature alone, there is no doubt but that, after allowing him to browse about in the fields of the modern literature for a time, he would then turn him back to the old literary remains of earlier times, and set him to reading the 'Nibelungenlied' (the example used by your correspondent). Nor would the learner find much difficulty in this new field. Your correspondent has doubtless found out for himself that, after becoming familiar with modern high German, he found no more difficulty in reading the 'Nibelungen' than in reading Chaucer. We may assume the same for Greek. Given a familiarity with the classic tongue, the added trouble of learning Homeric forms is slight. One day would suffice a bright boy, at home in classical Greek, for learning all the divergent grammatical forms found in Homer. As to the vocabulary, the number of new words is not under any circumstances very large. In reading Demosthenes after Plato he finds as many new words as in older literature, and words he will meet with as rarely in subsequent reading. If one can read classical Greek at sight, he can read Homer with little extra labor.

The dialects of the classical period are, further, not so divergent as "E. M. S." appears to assume, for though Meyer claims more than two dozen Greek dialects, these are, of course, mainly known from inscriptions, affecting the literature but little. The works composed in dialects differing from Attic Greek, *e. g.*, Herodotus, are not so widely divergent from the latter that their peculiarities cause the student any great effort, and the vocabulary differs but little. It is, I think, for this reason a mistake to compare the Greek with the German dialects. One who reads Goethe without a dictionary would find himself at sea were he to read a page of the works of Reuter, and this not from divergence of forms alone, but from the enormous mass of new words. On the other hand, he who has learned the few comprehensive changes demanded by the dialect of Herodotus from the Attic forms, finds that, by changing according to a few simple rules, the words as they stand in Herodotus become what he knows them in Attic. The added vocabulary is a mere nothing.

The answer to "E. M. S.'s" question is then two-fold: we do not teach Greek as we do German, first, because we do not teach them with the same end in view; second, because there is no parallel between the importance played by dialectic variation in German and that in Greek. It would require less time to teach the student all the regular variations from the "classical" (Attic) model found in Doric and Ionian Greek than it would to give him an understanding of the peculiarities of one German dialect. A good scholar in Attic Greek could translate an idyl of Theocritus with five minutes' explanation of forms hitherto unknown to him. It would take more time than that for a well-informed student of German to get the cue whereby to translate such ordinary dialect as is found in Swabian songs, to say nothing of the prose literature in such dialects. E. W. H.

New York, January 12, 1884.

Notes.

J. B. Lippincott & Co. have in press 'Early Church History, to the Death of Constantine,' compiled by the late Edward Backhouse, and edited and enlarged by Charles Tylor.

The *Critic* and *Good Literature* have effected a consolidation of titles and property. Their distinctive contents, too—original and eclectic—will be found combined in the new issue bearing the joint name.

The *Auk* is the designation of the quarterly journal of ornithology which, from the present month, continues and succeeds the Bulletin of the Nuttall Club, as the organ of the American Ornithologists' Union. Mr. J. A. Allen will edit it, with the assistance of Dr. Coues and Messrs. Brewster and Chamberlain. The publishers will be Estes & Lauriat, Boston.

Extraordinary inducements are offered to readers of the *Higher Republic*, the self-styled "organ of the literary societies and of the Culture League of America" (New York), which promises during the coming year to give "substantial condensations of thirty great world-books, including six novels."

The same cannot be said of the latest in the "American Heir" series of pamphlets—'Genealogical and Historical Record of the Carpenter Family . . . including a full, complete, and reliable history of the Carpenter Estate in England' (New York: James Usher). Mr. Usher concludes a very amusing and discursive account of his researches in the mother country by frankly reporting to the Carpenter Fund Association that "it may now be definitely taken as a fixed fact that the so-called 'Carpenter Estate' does not exist, except in the fiction of tradition and the hopes of expectant recipients."

A complete edition of the poetical works of A. C. Swinburne (New York: John D. Williams) furnishes solid evidence of the productiveness of this writer, as it fills a volume of no less than 730 pages of rather fine type.

Mr. W. J. Rolfe has added "Titus Andronicus" to the edition of Shakspere's plays which he publishes through Harper & Bros. The evidence for and against the traditional authorship is presented at some length in his preface.

Special List No. 1 of the Cornell University Library is a reprint from that periodical of the classified catalogue of works composing the Kelly Mathematical Collection. It fills nearly eighty pages in double columns, exclusive of the index.

The new edition of the 'Hand-Book for Readers,' of the Boston Public Library, possesses a more than local value; witness the lists of indexes to periodicals, of the periodicals accessible through Poole's Index, and of cyclopædias, and even the account of the several collections in the library.

Mr. Foster's *Monthly Reference Lists* (New York: F.W. Leypoldt), for December, completes the third volume with an index, and with two fresh topics—"The Northwest" and "Philosophy in America." Mr. Foster gives notice that the task has now become burdensome to him, and that he cannot perform it after the close of the present year; by which time we hope that the important series of references on the Federal administrations will have been completed, and a competent successor to Mr. Foster found.

A suggestive paper on the "Disadvantages of the Upright Position"—or proofs of the evolution of man from the quadrupeds in the arrangement of the valves of the circulatory system—by Dr. S. V. Clevenger, stands first in the *American Naturalist* for January. The foot-note which the author appends to it is also valuable as a contribution to the history of the higher education in this country. It appears that the reading of this paper before the Chicago University Club last year cost Dr. Clevenger an appointment to the chair of Comparative Anatomy and Physiology in that University, of which the President is a Baptist clergyman.

The sixth volume of the new 'Brockhaus' Conversations-Lexikon' (New York: L. W. Schmidt) is concluded with parts 84–90, at the title Forckenbeck. This is one of the more barren encyclopædic tracts, and gives occasion for few elaborate articles. Military matters, from fencing to fortifications and tactics, are well looked after, and much space is devoted to fire insurance, with the aid of statistical tables. The three chief biographies, quantitatively, are those of Paul Falk, the famous author of the now low-fallen May laws; Farragut, of whom the appreciation is very hearty; and Fichte. Florence is one of the longest geographical articles. The plates deal with national flags, fortifications, ferns, fish, carnivorous plants, and various machines. The maps represent Europe physically, historically, and ethnographically.

Insects still occupy the current issues (parts 105–112) of 'Brehm's Thierleben' (Westermann). Some of the colored plates are very effective, as for instance that representing the march of the army worm, the mounds of the termites, etc.

The same house sends us *Science et Nature*, a new journal begun to be issued in Paris last month, and embracing in its double title the American and English scientific weeklies. The first number commends itself at once to Americans by a description of the "redskins" (Omahas) at the Jardin d'Acclimatation, the illustration accompanying which, however, is not a favorable (though it may be a fair) sample of French ethnographical representation. The second number opens with a paper on Krakatoa, the illustration here being well engraved from a photograph. Other articles show the freshness of this "international review," as Paul Lévy's report on the present state of the Panama Canal, with an authentic view of the depot of Emperador; and D. Napoli's account of the lightning Eastern Express to Constantinople, equipped with "wagon-lits" (sleeping-cars). The contents consist chiefly of signed articles, the editorial hand appearing only in scientific summaries and book notices, a *chronique*, etc. The decidedly popular character of this journal is shown in its admitting scientific games and plays.

In the month of July last, a conference was held in London of the managers of hospitals. It is well known that many of the great hospitals of the metropolis are based upon very ancient foundations, and that usages exist in their administration which might well be changed. The object of this conference was to urge upon the Government the appointment of a Royal Commission of Inquiry, "to obtain reliable data upon which reforms should be based and to make recommendations." Fourteen papers were presented to the meeting, and a report upon them and of the discussions which they evoked has just been distributed. Much of this matter is, of course, local, but some of the points taken up are of interest in this country, especially these: on the best forms of administration in an hospital; on the relations of professional and lay authority; on the relations of hospitals to medical schools; on "Provident Dispensaries" (such as those lately established by Sir Charles Trevelyan and his co-workers), and on convalescent institutions. Among those who contributed to these discussions the names are found of B. B. Rawlings, J. S. Bristowe, Timothy Holmes, Henry C. Burdett, Thomas Blair, Sir Rutherford Alcock, Sir T. F. Buxton, Francis S. Powell, and many others well known as philanthropists or as men of high professional rank.

It is reported on good authority that Sir William Thomson, the distinguished physicist of Glasgow, has accepted an invitation to deliver a course of fifteen or twenty lectures at the Johns Hopkins University, beginning about the first of October, 1884. The subject and dates will be made known by an official announcement as soon as they are exactly determined, and arrangements will be made by which gentlemen from other colleges may attend the course.

Rear-Admiral Shufeldt, the Superintendent of the Naval Observatory, has communicated to the Royal Astronomical Society the results of Prof. Hall's computation of the mass of the planet Saturn. With the twenty-six-inch telescope of the Observatory he observed, in 1875, 1876, and 1877, the positions of the satellite Japetus relative to the primary, and, following the methods of Bessel, he determined the mean angular distance of the satellite from the planet to be 515.522." To find the periodic time of the satellite, he employed certain observations of the Herschels in connection with his own, giving for the sidereal revolution 79.3310152 days. A combination of these two elements gives for the mass of Saturn 1-3482.2 that of the sun—a value in close accord with the better previous determinations of this quantity.

Mr. Quaritch, London, will publish a series of twenty-nine photographic reproductions of the choicest cinquecento Italian engravings, including twenty plates of the Botticelli Dante (1481) and three from the 'Monte Sancto di Dio' (Botticelli, 1477). He will also publish a series of plant studies "for the use of artists and designers," by George C. Haité, with (as we gather from the prospectus) accurate drawings of fifty familiar plants in monochrome. We think that "artists and designers" would do better to give themselves the trouble of drawing from nature what they want. This process of working from information instead of knowledge is leading to the degradation and inanity of every art in which it is employed, and if an artist is not serious enough in his work to get what he wants at first hand, he will make but a duffer in art. Designers who are mechanical enough to work on such material will do equally well, or ill, on other people's designs.

Mr. Quaritch's more serious prospectus of a German work on the ornament of textile fabrics, illustrated by 1,000 patterns, printed in gold and colors, of ancient and mediæval fabrics, comes into another category of ideas. Of the results of art and its ways and modifications the artist cannot know too much or learn unwisely, copying slavishly being always debarred. This work will have as great a value for designers as anything published in this century, as the reproductions now made by German printers are scarcely to be distinguished by the eye from samples of the stuffs.

—One of the surprises of the past summer was the very sudden and very great success of a French book about England—'John Bull et son Île: Mœurs Anglaises Contemporaines,' by M. Max O'Rell, of which a translation has just been brought out by the Messrs. Scribner. This book ran through ten editions very rapidly indeed, with a promise of passing its twentieth. In England it was received with great curiosity, and with an evident willingness to make fun out of its obvious errors. The *Saturday Review* was almost the only paper in London which gave it the respectful consideration it deserved. For it is no hasty sketch, flippantly scribbled after a fortnight's scamper through Great Britain. Although written with Gallic brightness and lightness, it is based on extended study and actual investigation on the spot. Of course it is not for a moment to be compared with Emerson's great little book on England, or even with M. Taine's 'Notes'; but it considers phases of English life and character passed over by its predecessors. It is like Emerson's and M. Taine's books in that it is the work of an admirer, but of an admirer who has not left at home his French training, his keen eyes, and his critical faculty. It is the work of a sincere admirer, and yet the impression it leaves is not altogether favorable. For one thing, M. "O'Rell"—the name is evidently a pseudonym—has views about the British lower classes quite like those of Mr. Matthew Arnold, except that he seeks for a stronger adjective than brutalized. And in this we are inclined to think he resembles all intelligent and thoughtful American travellers in England, many of whom find London the saddest and most painful city in the world. But M. "O'Rell" does not confine himself to low life—indeed, he touches on it only incidentally; and his remarks on English society and English character from a Frenchman's point of view are interesting and instructive to an American, who must needs occupy a standpoint at once alike and unlike M. "O'Rell" blunders freely, but perhaps not as freely as one would expect. He is over-cautious and over-credulous. He is inclined to place too much reliance on what he sees and on what he hears. The assertion, for instance, that Mrs. Langtry appeared before crowded houses in New York while Mme. Patti sang to empty benches, is not wholly in accord with the facts. In general it may be said that M. "O'Rell's" information about America is as bad as his opinion of this country.

—In a late number of the *Overland Monthly*, Mr. John Johnson, jr., gives an interesting account of rudimentary society among boys at a large school near Baltimore, in the centre of a farm of 800 acres, over which they were permitted to roam at will. When nuts are ripe small parties of boys rush to desirable trees, shake them, and then go to other trees and repeat the process. Nut hunters coming to a tree already shaken are required, by custom so strong that it is held a very grave breach of honor to violate it, to pick up all the nuts shaken down by the first party before they can shake it further. This is not without justice, for thus the labor of shaking is not lost to the first

shaker. As to bird-nests and squirrel dens another custom is established. The first finder tacks his name on the tree containing them, and his right is respected till eggs or young are ready to take away. The rights thus acquired by the act of appropriation last but one season, but the custom, which was traditional, was established only after many conflicts and fights. The appeal, as in primitive society, is now never to equity, but always to custom. After conflicts respecting the distance at which other rabbit-traps could be set from that first set, a vigorous boy destroyed all others within a radius of twenty yards, and this limit became at last established. Thus ownership of land was developed. The first trapper owned all the game within this domain, and sometimes forbade others to walk within these bounds. A disused, unbaited trap gave no rights. At length "rings" were formed, and many traps were made and set on the best spots a day or two before the opening of the trapping season. Thus the enterprising and unscrupulous boys owned a whole swamp by dotting it with traps forty yards apart, and ate their game, not without sometimes giving a joint or neck to some poorer neighbor. Rights of devise to others on leaving school were at length admitted, ownership holding over from season to season; then the tracts were sold, and at last most of the desirable land fell into the hands of a few monopolists, against whom there was a combination, and at length a reform. A currency of "butters" arose, the unit of which was the ounce allowed every boy at a meal. A rabbit's leg was sold for three, while a pair of skates was worth forty butters. As these could not be eaten at once, a clearing-house system and bills or tags of credit were devised. It is to be hoped that other similar studies will tell us more of the spontaneous out-of-school life of children.

—A serious book which we have found very amusing, on 'Degrees, Gowns, and Hoods,' has just come under our eye. Its author is the Rev. T. W. Wood, "Vicar of Eldersfield, and a Chaplain of the Order of St. John of Jerusalem in England, author of 'Ecclesiastical and Academical Colors,' 'Guide to Ordination,' etc." All who are interested in academic millinery will find this volume as good as a book of fashion-plates. Here we have the significance of all the gowns and hoods still used in England succinctly stated. These distinctions are very important. For example, a Doctor of Divinity in the University of Durham may wear "a scarlet cassimere hood, lined with palatinate purple silk," but he must not be confounded with a Bachelor of Medicine in the same University, who wears "a hood of scarlet silk, lined with palatinate purple silk and bound with white fur." Our object, however, in mentioning this book is to speak of the pages devoted to this country. The author informs us that, after the appearance of his preliminary list, he received "unsolicited communications from Canada, the United States, and Australia," offering to supply information in respect to "the Universities and Colleges in those distant parts." Accordingly, "copies of University Calendars, or Catalogues, as they are called in the United States," were forwarded to him—"some large volumes," but others "mere pamphlets stitched in paper covers." From these sources, apparently, the author has found out that there is a tendency in the United States "to introduce gowns and hoods for the use of graduates." In order to see how far this tendency has gone, we turned at once to the chapter on "American (U. S.) Universities." At the head of the list is "Trinity College, Hartford, Connecticut, founded 1801," where we are told that the gowns are of black stuff or silk, and hoods are prescribed for the degrees of B.A., M.A., B.D., D.D., LL.D., and Mus.D. Next in the list of "American U. S. Universities" comes "the General Theological Seminary of the Episcopal Church, New York," with two hoods (B.D. and D.D.) "The University of the South," with a list of ten hoods, stands third in order, and "Racine College," with its six hoods, closes this list. Then comes a statement that "the following United States Universities have not yet any academical costume"; and between the names of Harvard, at the head, and Yale, at the foot, we have a list of six "Universities": Dartmouth, Williams, Pennsylvania, Columbia, Kenyon, and Boston. After these chosen eight Universities, we have a long list of the principal "Colleges" which are empowered to confer degrees, including, we find, "Peddie Institute," "Princetown College," "Decorah College," "Sheffield Scientific College," "Simpson College," "Worcester University," and so on, *ad finem*. If Mr. Wood finds as much trouble in defining the colors and furs of academic hoods as he does in giving the names of "American Universities," we shall all agree with him in thinking it to be "most desirable that a recognized hood should be granted to the Theological Colleges, about which there could be no misunderstanding on the part of the College authorities, the students, or the public."

—The recently published first volume of the general statistics of the railroads of Germany ('Statistik der im Betrieb befindlichen Eisenbahnen Deutschlands') is a mine of well-organized information in regard to almost every branch of the subject of which it treats. Although the general subject of statistics of transportation is reserved for a second volume, the information furnished by the part already issued is so much in excess of the information we receive from any publication in our own country, that the first volume seems really complete in itself. The work is hereafter to be issued periodically, and it promises to be one of the most valuable of the imperial publications. The railroads of the empire are first classified under three heads: the trunk lines, the collateral branches, and the private roads. The trunk lines at the end of 1881 amounted to 33,707 kilometres (23,020 English miles), the collateral branches 192 kilometres, and the private roads, 1,477 kilometres. The trunk roads, again, are divided into three classes—those owned and controlled by the state comprising 22,325 kilometres; those owned by corporations but controlled and administered by the state, 3,737 kilometres; and those both owned and controlled as private corporations, 7,644 kilometres. The cost of construction was 8,400 million marks, or 248,850 marks per kilometre. The entire income of the roads was 886 million marks, while the disbursements were 494 millions. Of the income, 236 million marks were derived from passengers and luggage, and 591.2 millions from freight. There are 66 insurance companies for pensioning and assisting railroad employees, with a capital of 76 million marks; and during the year under review the receipts of these companies were 13.1 million marks, and the disbursements 9.6 millions. But perhaps what will seem to an American the most striking of these statistics are those which relate to accidents. The number of travellers in the whole German Empire killed on the railroads by no fault of their own was only 5, and the number injured was only 99. The number killed or wounded, as the result of carelessness on their own part, was 138. Of the employees of the roads, for every 1,000,000 of kilometres travelled 1.14 are killed and 6.89 are injured.

—The first part of the promised work of Herr Asmus on the domestic architecture and methods of living in Europe ('Wie Europa baut und wohnt') furnishes some interesting comparisons. London, in the twenty-five years from 1856 to 1882, increased the number of its dwellings from 258,000 to 420,000. In 1882, in round numbers, 20,000 new houses were built with accommodations for 120,000 inhabitants. Berlin, in the same period, had an accession of 175,000 inhabitants, though the number of new buildings is given as only 2,118. While in London the family frequently occupies the whole house, in Berlin the system of flats prevails, and consequently, while the average number of occupants of a house is only six, in Berlin it is no less than fifty-six. In Paris the average number of occupants is twenty-five and a fraction. In point of architecture the houses of Vienna are the most elaborate and in their appointments the most luxurious, as well as the most expensive. In Brussels is to be seen the most pleasing variety of architecture, where the Gothic and the Flemish Renaissance have been combined with the most artistic results. The greatest variety, however, is to be found in Hamburg. This, in the opinion of the author, is owing to the habit of the young merchants of spending a year or two in travel and study in England and in the other parts of Europe, or, perhaps, in America. Here are to be found excellent examples of the French, the Italian, the Greek, and the German Renaissance as well as of the English Gothic. In Munich a long rivalry has been carried on between the German and the Italian Renaissance; and both of these orders have been represented by masters of extraordinary merits. In Berlin there is a very marked tendency to break away from the traditional characteristics of the Greek Renaissance, and to adopt the more modern styles. With this tendency sandstone and limestone have come to be so generally used that, in the opinion of Herr Asmus, the appearance of the city will be quite revolutionized within the next ten years.

—Some months since, a German professor, K. B. Hofmann, in the *Wiener Studien*, confirmed an old suspicion that what we call soap was unknown in antiquity. The so-called soap found at Pompeii in 1825 and again in 1875 turns out upon analysis to be nothing but a fair specimen of fuller's earth. The antique *sapo* was no soap at all, but a kind of pomatum made of grease and ashes, which the Gauls and Germans used in order to turn their hair red. Cleanliness is next to godliness, but love of personal adornment is older than the first, perhaps older than the second, and it is with a certain pride in this historical retrospect that Professor Hofmann pictures to himself his unwashed ancestors with their heads full of pomatum. The survival of this custom has been noticed by travellers almost everywhere in Germany. This philological discussion of the soap question seems to have escaped the notice of the soap-fanciers, and in like manner, it is to be feared, the discussions of the poisonous character of bull's blood will be kept out of the knowledge of the general public, who ought to be interested in it, because another learned professor has seen fit to publish his lucubrations in the special philological organ known as *Fleckeisen's Jahrbücher*. In a recent number of this journal, Professor W. H. Roscher has considered at length the question as to the poisonous character of bull's blood, which is said to have shortened the lives of sundry worthies of antiquity, most famous of whom is Themistocles. It is true that the case of Themistocles seems to have little support, but it is, nevertheless, beyond question that bull's blood was often mentioned as a virulent poison. Modern experience seems to be at war with this statement, American physicians, as Professor

Roscher's article notes, often prescribe fresh blood as a regimen, with the happiest results. Coagulation might be supposed to make a difference, but coagulation is unkind enough not to make any difference, and it is hard to believe that what is the American's meat was the Greek's poison. The explanation suggested by Prof. Karl Ludwig, of Leipzig, in response to Professor Roscher's inquiry, is that the blood of animals affected with splenic fever being very poisonous then as it is now, the prejudice extended from diseased bull's blood to healthy bull's blood; just as, we may add, trichinosis has brought into disrepute the innocent and nutritious swine. It must be confessed that it is a somewhat suspicious circumstance that most of the antique deaths that occurred by means of bull's blood were set down as suicides; and yet it is not beyond the dream of probability that a German romancer should represent a lovelorn maiden as slowly wasting away under self-administered doses of American pork.

— We have before us a late Spanish work of great interest touching the history of the early explorations in New Mexico. The author of the work, Capt. Fernandez Duro, was deputed by the Royal Academy of History at Madrid to report upon the travels and career of Diego de Peñalosa in New Mexico, and the results of his investigation are given under the following title: 'Don Diego de Peñalosa y su descubrimiento del Reino de Quivira' (Madrid, 1882). The journal of a reputed expedition made by Peñalosa in 1662, from Santa Fé to the province of Quivira (a place first made known by Coronado in 1542, who visited it on his famous journey to the seven cities of Cibola), drawn up by a Franciscan Father, Nicolas de Freitas; a summary of the Spanish explorations in New Mexico and along the Gulf; an official report made to the King of Spain in 1685, describing the provinces of New Mexico, Quivira, and Teguayo, with other accessory documents, form the main part of Capt. Fernandez's report. The authenticity of Peñalosa's journal is discussed, with unfavorable conclusions. According to his own statement, Peñalosa was Governor of New Mexico from 1661 to 1664, and although his name does not appear in the official register of the Governors of that province kept at Mexico, he is borne out in this claim by other documentary evidence. In 1684 he is found at the court of France offering his services in an expedition for the conquest of the Spanish dominions in southwestern America. To prove his familiarity with the country, and to excite the cupidity of Louis XIV., he presents the narrative of his pretended journey to Quivira, showing the great riches that might be acquired by conquest. When we consider that his journal presents no information which the reports of the journeys of previous travellers (Coronado in 1542, Humaña in 1599, Oñate in 1605) do not afford, coupled with the fact that the archives of Spain, the contemporary histories, and Posadas, who recounts the explorations from 1605 to 1684, fail to give any account of Peñalosa, we must share the distrust which Fernandez entertains of his narrative. It seems quite likely that Peñalosa, after becoming embroiled with the Spanish authorities, and being deposed from the Governorship, should, in furtherance of the plan which he conceived for the destruction of the Spanish power in New Mexico, have made up from the relations of Coronado and others an account embellished with some marvellous descriptions. It will be remembered, however, that Dr. Shea, in 1882, brought out the original text of De Freitas's recital, with a translation and accompanying documents, mainly in order to establish La Salle's complicity in Peñalosa's designs against Spain. Captain Fernandez discusses this matter, and prints the documents bearing upon it. The most important part of his report is the bibliographical section, which indicates original authorities upon the expeditions sent from New Mexico from 1523 to 1783 for the discovery of the territories of the North, especially those to Cibola, Quivira, and Teguayo Quivira has been variously placed on the Mississippi, about midway of its course (Fernandez Duro), northeast of the Missouri (Shea), near the boundary between the States of Kansas, Nebraska, and Missouri (Simpson), and west of the Platte (Savage). Some early Spanish maps show it southeast of Santa Fé, which, however, is manifestly not the Quivira of Coronado.

—The United States Transit of Venus Commission, under whose direction all the operations undertaken by our Government in connection with the transits of 1874 and 1882 were carried out, has lately communicated a statement with regard to the conduct of its affairs and the reduction of the observations. The number of parties organized for the observation of the transit of 1882 was eight, four of which were sent to the southern hemisphere, the other four remaining in the United States. The foreign stations were, with their Chief Astronomers, as follows: Wellington, South Africa, Professor Simon Newcomb; Santa Cruz, Patagonia, Lieutenant Samuel W. Very; Santiago de Chile, Professor Lewis Boss; Auckland, New Zealand, Mr. Edwin Smith. The home stations were Washington, D. C., Professor William Harkness; Cedar Keys, Florida, Professor John R. Eastman; San Antonio, Texas, Professor Asaph Hall; Cerro Roblero, New Mexico, Professor George Davidson. In addition to these parties, there were two others, equipped wholly or in part at private expense, but whose operations were conducted in such a way as to insure the strict comparability of their work with that of the Government parties. One of these was stationed at Princeton, New Jersey, in charge of Professor Charles A. Young, and the other at the Lick Observatory, Mount Hamilton, California, in charge of Professor David P. Todd. The photographic results will be derived from the labors of these two parties in the same way as from the Government photographs, and the final report will contain the work of all ten parties on a uniform plan. The Commission's report states that, on the day of the last transit, the sky was perfectly clear at about half the stations, while at the remainder clouds impeded the work more or less, but nowhere to the extent of producing failure. The number of photographic plates obtained at all the stations, and which will be available for measurement, are in the aggregate nearly fourteen hundred, of which about eight hundred were obtained in the northern hemisphere and six hundred in the southern. They are distributed with a fair evenness among the ten stations, except that Auckland and Washington were unfortunate in obtaining very few. The reductions of all these photographic observations are now going on, four computers being employed in the work. The photographs obtained at three of the stations have already been measured, and some progress has been made in the reductions based upon these measurements. It is believed that the sun's distance derivable from the transits of Venus in 1874 and 1882 must depend chiefly upon the photographs; and when it is remembered that the conditions of weather on the former occasion were so unfavorable as to allow only between two and three hundred available negatives to be made in both hemispheres, the remarkable success of the operations during the transit of December, 1882, will be apparent. If no unforeseen delay occurs, probably the definitive result from the photographs of both these transits of Venus can be arrived at in about four years.

—Steinway Hall was completely filled on Saturday afternoon when Mr. Theodore Thomas and an orchestra of Philharmonic musicians gave the second of the series of concerts for young people. The young people were of all ages, from five to seventy-five, and the only difference between the young and the old seemed to be that the former often frankly expressed by a beaming countenance the satisfaction which, in the case of their elders, assumed the appearance of more placid enjoyment, while both shared in the applause. If any one had doubted that children could enjoy simple orchestral music and remain absolutely quiet while listening to it, these doubts would have been dispelled on Saturday. The concert opened with Mozart's "Magic Flute" overture, and closed with Strauss's "Blue Danube" waltz. The Dance of the Blessed in the Elysian Fields, and the Dance of the Furies, from Gluck's "Orpheus," formed a fascinating number. Comparing this with the orchestral arrangement of Weber's Invitation to the Dance, which followed later on, it was interesting to note the difference between the antique quiet and stately dance rhythms of Gluck and the excited, rapid, passionate movement of Weber's waltz, the forerunner of those gems of Chopin and Strauss which embody the psychology of love more completely than all the lyric verse of the poets. The allegretto from Beethoven's Eighth Symphony, Rossini's "Tell" overture, and Gounod's quaint "Funeral March of a Marionette" formed the remaining orchestral numbers. Vocal numbers were contributed by Miss Ella Earle, who sang two Schubert songs with a pleasant voice and good expression, and by Mr. Remmertz, who sang Schumann's "Two Grenadiers" with so much vigor and impressive tone quality that he was obliged to repeat the Marseillaise part of it. There can be no doubt, to judge by the large attendance at the first two matinées, that these concerts will become a permanent feature of our musical seasons. Next year it will probably be found necessary to expand them into a regular series of popular matinées, supplementary to the Philharmonic concerts.

RECENT NOVELS.

All in a Garden Fair. By Walter Besant. Harpers' Franklin Square Library.

Round the Galley Fire. By W. Clark Russell. Harpers' Franklin Square Library.

The Bread-Winners. A Social Study. Harpers. 1884.

Hand and Ring. By the Author of 'The Leavenworth Case.' G. P. Putnam's Sons.

Vagabondia. By Frances Hodgson Burnett. Boston: James R. Osgood & Co.

Judith. A Chronicle of Old Virginia. By Marion Harland. Philadelphia: *Our Continent* Publishing Co.

Arius, the Libyan. An Idyl of the Primitive Church. D. Appleton & Co.

Guenn. A Wave on the Breton Coast. By Blanche Willis Howard. Boston: James R. Osgood & Co.

The Mate of the Daylight, and Friends Ashore. By Sarah Orne Jewett. Boston: Houghton, Mifflin & Co.

The Jewel in the Lotos. By Mary Agnes Tincker. Philadelphia: J. B. Lippincott & Co.

Adrian Bright. By Mrs. Cady. Harpers' Franklin Square Library.

MR. WALTER BESANT, now that the partnership formerly existing between him and Mr. Rice is

unhappily dissolved, writes novels marked by a peculiar vein of fancy, which, if we must criticise it, we should be inclined to call a little unbalanced. Mr. Rice did something to balance it. 'All in a Garden Fair' is slightly grotesque. It does not want humor, but lacks judgment in the use of humor. It is, in fact, a confessed extravaganza—the taste for this kind of literary production seems to be growing—but then even an extravaganza may be too extravagant. For instance, the idea of the little community of retired bankrupts with which the book opens, is a very good one, but it hardly bears the elaborate development Mr. Besant gives it. The notion of a place where the consequence of a man depends on the magnitude of the sum for which he has failed in business is amusing, but it is here worked up till its absurdity begins to bore us. The ingenuity, resource, and fancy of Mr. Besant are so great that he is better equipped for novel-writing than many of his rivals of greater repute. Nor does he exhaust himself, as so many of them do. He needs the sort of balance which Mr. Rice's judgment seems to have supplied, and wrote better when he was, if we may use such an expression, collaborated, than he now does alone.

Mr. Russell has established for himself a peculiar literary position. He has almost a monopoly of the marine-fiction market, and is the author of more sea stories than any one else has produced since the days of Cooper and Marryat. Some of his short stories are among his best, and we doubt if any one can look through his last collection without finding something to his taste. The tale of the ship which put to sea with a bailiff who came on board to commence proceedings in admiralty, has a racy, rollicking flavor of reality, particularly in the description of the rage of the narrator (the mate) at the captain's being warned that one of the consequences would be his having "to purge" in court (*i. e.*, to purge himself of his contempt). The essay on sea songs and the false sea lingo used in them would be more to the purpose if the audience generally cared very much for accuracy in these matters. Sea songs and sea stories, if successful, are mainly written for landsmen, who would like "A wet sheet and a flowing sea" just about as well whether the author knew, or did not know, that the image called up to the nautical mind by the line is that of a small fore-and-aft-rigged vessel going before the wind, and very much pressed over.

We frequently referred to 'The Bread-Winners' while it was running through the pages of the *Century*. It may be described as a story of American life by a genial American cynic. It introduces us to the extremes of trades-unionism and fashionable life in an American city of the type represented by Cleveland, Ohio. The "Bread-Winners" are a trade-union, marked by that hatred of work and envy of the rich which the author evidently considers the distinguishing characteristics of American labor-reformers. The leading spirit among them is a thief and would-be murderer. The female type corresponding to this is given in Maud Matchin, a product of parental neglect, circulating libraries, and fashion newspapers. Vanity and greed are Maud's foibles, and if she is not a very agreeable character, that is not the author's fault. There are probably many hundred Mauds in real life in the United States who will not, perhaps, recognize the portrait themselves, but it will be recognized for them by their mothers and fathers, or more probably their uncles, aunts, and the clergymen under whom they teach, or escape from teaching, Sunday-school. Farnham is a sketch of an American gentleman; but, for some reason, the American gentleman is very hard to draw, and is apt to be a little too good to be true. In novels this type occupies a relation to the actual man of the world analogous to that in which the old-fashioned hero of romance stood to the actual gentleman of his day. The American gentleman has, no doubt, a high standard of good manners; but in American novels he has too good manners—just as the hero used to be so heroic that we could not endure him. Farnham is a good attempt: he is what we should call always the gentleman—but then that is different from being a gentleman. Judging from internal evidence, 'The Bread-Winners' was not originally intended as a "study," but the author, after laying the foundations for a long novel—and laying them carefully—reduced it to the proportions of a sketch, perhaps finding the labor involved in the execution of the original plan too great.

'Hand and Ring' would not have gained for the author the fame which followed the 'Leavenworth Case.' It is ingenious in combinations, and it accumulates one dilemma upon another in a fashion worthy of Boisgobey; but such a story depends for its success upon the completeness of the surprise at the end. Here the main interest is hopelessly broken by an attempt to transfer it from one centre to another. The situation into which the pair of lovers is thrown is admirably contrived. The man is on trial for murder; the woman affirms her own guilt; and yet, to the experienced observer, each proves his and her own innocence by the struggle to conceal the mutual conviction that the other is the murderer. After that moment the sympathy of the reader is lost; for, startling as it may be to find that the counsel for the defence is, after all, the guilty one, the reader has not been led up to it, and, in any case, no one cares much to convict a dead man. The tramp, hackneyed as the device would be, might better have been used. It would be difficult to draw the line beyond which it will not do to go in this kind of stories, but the incident of the detective's stratagem is clearly beyond it. Every one feels it an outrage that must be impossible, and just so much of the effect of reality is lost.

'Vagabondia,' Mrs. Burnett writes in the preface, was her first novel. Had it been her only one there could have been no reason for reprinting it. As it is, it is welcome with all its juvenile sins upon its head. Only a tyro could have made a hero of such an idiot (no other word will do). Yet the book has the promise of much that came after. The sisters, so convincingly beautiful that they need no adjectives from the author, are of one kin with the 'Fair Barbarian.' That picture presupposed more than one preliminary study, and we are glad to see some of them in this book.

A story from Marion Harland is a return upon old days when Mrs. Southworth and Mrs. Lee Hentz were in fashion, as fashion in novels of that sort goes. Marion Harland told always a story full of incidents and of brave and handsome men and women. It was, in short, of the romantic school, as that school was understood in the Old Dominion, but always pure and high in motive. The present 'Chronicle' is of fifty years ago, and made to include a much earlier time by stories within the story. Readers whose standard is set by the great novels will not care at all for it, but the many who like a story because it is a story, might do much worse than to read this. It is a striking coincidence that while the book was published just as accounts were coming of the blue and green suns observed last autumn in the Indian Archipelago, it contains a vivid description of the same appearance in Virginia long ago, of which there remain many traditions:

"The tranquil landscape lay now like an accursed region. The sun shone in an unclouded sky. There was no haze about it. The awful change was in the burning disk itself, or in the light emitted by it: some declared that both were blue; others that they were green. . . . At the corner of the house were collected the negroes. Mothers had babies in their arms; two or three sick persons had arisen from bed and dressed hastily in the first garments that came to hand."

The contrast between the real and the imagined, even in the hands of a fairly good writer, is strikingly shown in the account first of what a young girl saw as the light shone on the family group at morning prayers, and then of the interview between the scared negroes and their master. The first must be the story of an eye-witness. We are sorry it is too long to quote.

'Arius, the Libyan' is called "a theological novel" by an approving critic who holds a position of authority in matters of theology; but if even he "would not want to be answerable for either the theological or historical accuracy of the book," what can the secular mind do but assert its preference for dates not a century out of the way, and for such grouping and rendering of facts as shall bear some relation to the accepted accounts of history? The Codex Alexandrinus which the story makes the gift of the betrothed of Arius to him, "bearing yet upon its priceless pages the endorsement of Arius," was not written for at least a hundred years after his death. Besides, we hold it a duty to insist that words shall be used in their accepted meanings. That cannot be an *idyl* which contains two deaths at the stake, the whole of the Nicene Council, and the death of Arius after his long imprisonment. Only two or three chapters have anything idyllic about them, and the rest makes no subject for a novel. The author's strong admiration for the sturdy self-reliance of Arius makes his story forcible, but it would have been much more to the purpose to have studied the subject more thoroughly and then have made a biographical sketch. To parcel out long discussions between sundry interlocutors, and to call Athanasius "a beautiful young man," does not make a novel.

Two or three obvious deductions have to be made before reaching an estimate of 'Guenn.' The frontispiece is a mistake for which we hardly think the author responsible: it is just so much in the way of everything that is said of the beauty and the grace of the heroine. It is a brave venture to choose a subject so sad that only great merit in the telling of the story can ever bring the reader back to it. In the matter of characterization, it may be questioned whether so selfish a nature as Hamor's could be so cold. When these things have been said, it is pleasant to give to the rest thorough and hearty praise. This book goes by all the others that the author has written, back to the first half of 'One Summer,' and fulfils the promise that made. There is the same clear and distinct expression of the idea in the composer's mind—the going straight to the mark that is only possible when there is a mark to go to. At the same time, the book shows the effects of longer and wider experience. This one feels not so much in fulness of narrative, but in the strict limitation of character and action. Only the narrow mind writes out all it holds. The most remarkable thing about the book is its forbearance—the withholding of the hand. The story has in it all the possibilities of the tragedy that is at once the most sensational and the most commonplace in fiction. It is no ordinary power that makes such a story original in plot, and faithful to truth in the conditions in which it was imagined.

"Guenn," the fairest and the shyest of the girls among the fisher-folk in a little coast village of Brittany, is coveted and won by an

artist for his model. Wakened to new life by contact with finer natures, the girl throws her whole soul into her hopes for the success of the picture, and into her devotion to the artist. The work done, he departs as lightly as he came, and the poor child is broken-hearted—broken-hearted, not dishonored; and therein appears the originality of the story. We have already suggested the doubt whether so selfish a nature would be so negative a one, but the character will bear study, and the artist will prove to be only a man of ready talent, with not genius enough to have even its faults. But this carries us to profounder reasoning than the author herself ever thought of.

Miss Jewett's stories need no commendation, but we delay a moment to mark them as another example, of which there are so few among the works of women, of that careful study which finds and brings out what we have to call the negative side of life. The world is accustomed to such positiveness and downrightness of fact and motive that it does not often realize the force of what does not happen—the meaning of *not doing*. Of the stories before us, "The New Parishioner" and "The Only Son" are striking illustrations, and, at the same time, are by far the most interesting. Miss Jewett, moreover, has a style, in the true sense, a manner of expression, fitting and beautiful, and her own.

The same cannot be said of the author of the 'Jewel in the Lotos.' Perhaps dress may be *dowdy* and rivers *wriggle* in polite literature, but when in the midst of a moonlight scene which, one is expected to believe, is all that is poetic and inspiring, "the imagination begins to hum," the style is, at least, not elegant. The story suggests echoes, far off, indeed, of writers as unlike as "Ouida" and Mr. James. This, it may be, accounts in part for the tameness of effect produced even by incidents of the true sensational character. A gentleman's climbing into a lady's balcony by late moonlight is either a piece of high-flown romance or something worse than burglary. The author does not know how to make it the one, and does not dare to make it the other, so it all falls flat. Nor is this for want of fine writing, as the reader may judge from the following (the old man is the guardian of the heroine):

"Engrossed in study of those ever-living truths which still stand green amid the snows of age and in the frozen polar ring of death, unblanched by the electric breath of passing souls or strange visionary auroras circling round that icy mystery beneath the dim funereal torch of the North Star of life, his mind was never shocked by being pelted with the faded weeds of earth."

'Adrian Bright' will give the same sort of pleasure to the reader as he gets from some of his acquaintances—people whose goings-on seem to him altogether unwarrantable, who never accomplish much, nor say anything to be remembered, but who are bright, chatty people, who always have a good time themselves, and are always ready to share it with their friends. The hero and heroine could not be of less account and maintain their positions. One takes but a mild interest in their fortunes as compared with the ways and deeds of a family of artist associations and occupations, as nearly Bohemian as the respectability of Welbeck Street will permit. It is rather a curious study, the pass to which Bohemianism has come under the influence of the æsthetic craze, and the author has succeeded very well in rendering it with hearty appreciation and yet keeping all the time her own little smile of amusement. There is rather too much of it, and the jealous young woman had better have been left out; nevertheless, the book is good for an hour or two of entertainment.

ORVILLE DEWEY.

Autobiography and Letters of Orville Dewey, D.D. Edited by his daughter, Mary E. Dewey. Boston: Roberts Brothers. 1883.

ONE cannot but think this an inadequate book. Dr. Dewey lived a very long life in the midst of exciting intellectual and political questions, and in one province of liberal thought he was a leader. A brief autobiography such as this, which tells next to nothing about its author's personality, even when eked out by selections from his correspondence with his ministerial or parochial friends, seems a slight memorial, especially as the letters, for the most part, have merely a friendly interest. Clergymen, it may be, like actors, have only a contemporary history; but within the limits of his own time Dr. Dewey's position and influence might have been more forcibly and intelligibly marked. As the matter stands, it is as if the volume were written in the last generation and meant to be read "in the forties," when the names of the old Unitarian divines were household words in New England.

The sketch of his own life by the aging clergyman opens in an old-fashioned way with reminiscences of a Massachusetts that has gone by, and it goes on rambling in both style and subject. The village of Sheffield, where he was born in 1794; the town-worthies, with their common library of 200 volumes, who read Pope and Johnson instead of the *Herald*, and quoted 'Paradise Lost' instead of stocks; the meeting-house, not too sacred then to be used for a play in which the child himself acted; the militia parade on training-day; the games in the street, quoit-throwing, running, horse-racing, the serenading boys—all the lost out-door sports that make the New England of that time seem like the merry England of old, even if Christmas was unknown to young Orville (named out of 'Evelina') except by the yule log that the Irish laborer, Richard, would bring in; the school-ma'am; the large-limbed, pale, hollow-cheeked minister, with his awful "Come here, child"; the heretic uncle, who, on his death-bed, informed the professionally-calling clergyman, "Sir, I desire neither your conversation nor your prayers"—all this he describes vividly, as if it were of yesterday.

The note, so struck, sounds on, although mournfully less, through his college days, his pastorates at Gloucester, Boston, and New Bedford; and when it dies out, the finest charm of his volume is lost with it. At New Bedford, for example, there was the old alchemist, Dr. Whittredge, of Tiverton, who kept a fire burning for forty years in search of the alluring secret, but never mentioned it except once after sermon time—"Ah, sir, this is the true doctrine! But it wants money—it wants money, sir, to spread it, and *I hope it will have it before long.*" At New Bedford, too, observation of an old deacon seems to have furnished Dr. Dewey with his extraordinary analysis of genius, which is too exquisitely materialistic not to be quoted, as coming from such lips: "The sanguine-bilious, I think, is the temperament for deep intellectual power—like Daniel Webster's. It lends not only strength, but protection, to the workings of the mind within. . . . I believe that I should have accomplished a great deal more if I had had, not the sanguine alone, but the sanguine-bilious temperament. Manasseh Kempton had it. He was the deacon, etc."

Whether it was the lack of the bilious element or not, Dr. Dewey was apparently dissatisfied with the results of his life. Through many difficulties he had made his way to a foremost place as an orator of his sect, only to be forced to leave his station in his prime because of some disease in the brain. Two or three characteristics only come out in his letters; noticeably, he disliked the special formalisms of "the cloth" and some of the duties that go with that profession, and, secondly, he never made up his mind. Early in life he regarded the reform he was helping to set going as the most important since the Reformation, and he spoke of preaching as the principal ministration of religion. As he went on he set more value on the religious mood simply, independently of its intellectual form; and at last, under the influence of Mansel, Spencer, and the comparative study of religions, he evidently came to the brink of that intellectual apathy which it is the fashion to call agnosticism. But there he stopped, holding fast to the emotional convictions bred by the habits of a life-time. In regard to the practical part of a clergyman's business, he was strongly of the belief that, as a class, the profession was much injured by the constant drain on the sympathy and the gradual loss of genuine feeling occasioned by private ministrations in families during times of trouble; indeed, he goes so far, in characterizing the debilitating effects of such experience, as to say "we are a sort of moral eunuchs." Not to put too much stress on the matter, he clearly wished the clergy to become secularized—if one may say so; to stand on a level with other men and among their kind, instead of being embalmed in the odors of sanctity and used on occasions of dread as a kind of fetish to charm off the Evil One. In this he may have gone too far, but he had much to ground his opinion on, as appears by his humorous description of the position of a clergyman at Washington in 1852, as he found it himself: "The gayety passes him by; the politics pass him by. Nobody wants him; nobody holds him by the button but some desperate, dilapidated philanthropist. People say, while turning a corner, 'How do you do, Doctor?' which is very much as if they said, 'How do you do, Abstraction?' I live in a 'lone conspicuity,' preach in a vacuum, and call, with much ado, to find nobody." Somehow, it was plain, the profession had lost its hold in the capital, and there was some glimmering of truth, at least, in his explanation of the matter.

Outside of his own domain, Dr. Dewey made no mark. He was not built to be a tower of strength to any cause. Just before the war, in the fall of 1859, he writes in italics, "*I can't take a side*"; and a man who could make such a confession then was meant for the rear. There is no doubt either of his disapproval of slavery or his loyalty, but he lacked courage to take the consequences of his thoughts; he wished "to wear round" the question; he desired to be "agreeable" to the South, and all that. One need not dwell upon this now, but it will be time enough to forget and forgive when the apologists for such conduct in such men are less numerous and more humble. This inability to take a side in politics is, however, only another phase of the same mind which in old age seems to have been doubtful of all the religious questions. There are few finer examples of the growth of irresolution in the mind than is here indicated; had it not been for the vague abstractions of Hegel and the optimism fostered by the theory of evolution, the intellectual fate of Dr. Dewey might have been melancholy. It must be said, however, that his memory is more honored by his own published works than by this posthumous volume, which is remarkably destitute of any literary or intellectual interest.

Folk-Lore of Shakspere. By the Rev. T. F. Thiselton Dyer, M.A., Oxon. Harper & Brothers. 1884.

MR. DYER has explained in this volume the

references made by Shakspere to the popular beliefs of his time on such subjects as fairies, ghosts, witches, the virtues of jewels or herbs, and the like, and also to the habits and customs of the nation in respect to marriage, burial, holidays, dances, etc. In the chapters on these topics he gives the substance of several separate monographs, such as Patterson's 'Insects Mentioned by Shakspere,' Hastings's 'Ornithology of Shakspere,' Ellacombe's 'Plant-Lore of Shakspere,' Beisly's 'Shakspere's Garden,' Bucknill's 'Medical Knowledge of Shakspere,' to all of which he makes ample acknowledgment, as well as to such well-known general authorities as Douce, Halliwell-Phillipps, Brand, Nares, Dyce, Furnivall, and other antiquarians. Thus, as these references indicate, his work is rather a compilation than the fruit of original research, and is a sort of dictionary to so much of Shakspere's subject, contradistinguished from his language, as has passed out of common knowledge. Such a volume has two uses—to elucidate the text and to illustrate the raw material on which Shakspere's mind worked. In regard to the first of these, as no strikingly new interpretations are suggested and none of the old difficulties are cleared up, it is unnecessary to say anything except to commend the lucid arrangement of the contents for the purpose of reference, and the thoroughness and fairness of the discussion of doubtful points. To this we will add only an expression of surprise at the single remark, "A pack of cards was formerly termed 'a deck of cards.'" The phrase certainly shows no sign of obsolescence in this country.

Of more interest to the general reader is the second use of this volume, as illustrative of the gross matter that Shakspere etherealized into poetry. It is most common now to take the coincidences of his dramas with contemporary life and thought as witnessing the keenness of his observation and the fidelity of his representation, as if the one were an unusual gift and the other a conscious virtue. In a sense, this is true; the knowledge which has almost approved him to the professions severally as one of themselves shows a wide acquaintance with men and books, and the present volume exhibits very plainly his familiarity with old wives' tales. Possibly, as is claimed, his mind might have furnished a universal gazetteer of the information of his age—not only of its learning, but of its folk-lore. There seem to be gaps, however, in his acquaintance with both these; he was neither a Roger Bacon nor a Grimm. In fact, what he knew best was the living knowledge of his time—that which was in people's minds and on their lips. The realism of his dramas, the debt they owe to actual life within his experience of its outward show, was not so much an effort of conscious art as the natural way of writing. So difficult is it for a modern to look on the drama as anything but the most artificial form of composition, that a poet, when he writes one, seems stepping on stilts; and a scholar, when he wishes to hear one, would rather go to his closet to read than to the theatre to listen. If one muse is more antiquated than another nowadays, it is Melpomene. But in old times the drama was as spontaneous to the popular heart as a ballad. It is sometimes remarked that the lyric, the simplest form of verse, is the dramatist's song (admirably shown by Shakspere); and, analogously, the drama in its perfection partakes of the unpremeditated outburst of the lyric in its essential nature.

Not to wander too far from the subject in hand, it seems to us that Shakspere's acquaintance with the folk-lore or other knowledge of his time evinces this intimate relation of the drama to the people rather than any special element in his genius or rules of art adopted by his own choice. He was merely the successor of the old ballad-singer, who stood in the market or the hall and sang ancient lays. He felt, perhaps not less by the secret intuition of genius than by the necessities of the development of drama as a national art, that he must bring on the stage the shearing-feast, the betrothal, the revels, the fairies'-court, the witches' Sabbath, the poor ghost, the coranto and canary and upspring; must wake pathos by the birds and flowers about which fit associations had clustered in old legends; must astonish with the unicorn, and the phœnix on the lone Arabian tree, and the anthropophagi; must, in short, make the springs of poetry gush from their early fountains in the sense of beauty in rustic surroundings, of wonder in rustic superstition, of pleasure in rustic exercises. He used the contemporary life of the city in the same way for wit, and the court for splendor or satire; but it is the "merrie England" of the country lads and lassies that gives his dramas the freshness of their charm.

Therefore, while, by the light of this book, the realism of Shakspere is acknowledged and laid to heart, the fact that he wore his realism "with a difference" ought not to be lost sight of. He was bred in the school of the people—that was all. He rose from them to the height of human imagination thereby. In our days it seems rather that realism is a condescension of the better to the worse, a stooping down of the mind to pick its golden coin out of the mire; not a people's life elevated in a man's, but a man's life debased into a people's. One cannot help noting, too, in the same connection, what there was really beautiful and noble in the England of Shakspere—what fine poetic elements were ready to the hand (although there was so much besides that was coarse, drunken, and lecherous, only endurable to art under the disguise of humor, if at all). The holidays, the games and dances, the feasts, the songs and proverbs, the freedoms and jollities, the pretty tales that made the redbreast and the pansy nearer of kin to mankind, the solemn offices of religion, the old Norse superstition that peopled the earth with sprites and elves and goblins—all this, and more, lived anew in his imagination; but now, when the Maypoles are cut down, and there are pianos in the farmers' houses, and the old-fashioned flowers bloom neglected, and the sad tale that little Mamillius would have told so softly "yond crickets should not hear it," has given way to stories out of Ariosto and Browning, who can be surprised that the English poets study Theocritus and leave realism to the French?

If any one would see how realism as a term of criticism is, like any watchword of any party, merely a bundle of prejudices, he could not do better than examine, by the aid of this volume, how Shakspere, the prince of realists, and able besides to give a local habitation and a name to airy nothings, dealt with the matter that his senses brought to him, so that the witches he shuddered at in his boyhood gained a sort of dignity that confounds them in the mind with the Norns of the North and the Fates of the South, and *Oberon* and *Titania* are as credible as *Bottom*. We have no space to point out the slight increments of fact, the mere sharpening of distinctions, the unnoticed clarifying of detail by which he transformed, or rather perfected, the creations of popular fancy and the festivals of the yeomanry, as in the "Midsummer Night's Dream" and "A Winter's Tale"; but the young author who thinks a note-book his best offering at Delphi may well read and ponder. Let any man who can trust his own judgment take this book, which is a compendium of Shakspere's local and temporal realism, and settle how much, after all, would "Lear" be injured were all this knowledge here contained erased from human records.

La Gravure en Italie avant Marc Antoine (1452–1505). Par le Vicomte Henri Delaborde. Bibliothèque Internationale de l'Art. 1883.

It is not surprising that M. Delaborde, with his rare advantages, his critical powers, and his refined artistic perceptions, should rank as a leading European authority on all points relating to prints and their history. The department of engravings at the National Library, Paris, over which he has presided for many years, contains, as he states in an historical notice, printed in 1875, more than two million two hundred thousand prints, some of which are unique, and many of exceeding rarity and value. During the terrible days of the Commune their fate trembled in the balance, and there is no doubt that the destruction of the building, with all its precious contents—a catastrophe which would have ranked in history with the burning of the Alexandrian Library—was averted by the courage, the patience, and the judgment of the officials, among whom M. Delaborde and his assistants were conspicuous. This entitles them to that sympathy which we feel for men who have shown an heroic disregard of personal risk in the discharge of duty, and gives to any work by M. Delaborde an interest apart from its special value.

In the history of engraving during the half century discussed in his pages, disputed points present themselves, from time to time, which involve questions of German or Italian precedence in invention, relative technical merit, etc.—questions too often decided by national prejudice when the judge himself belongs to either nation. Being a Frenchman, M. Delaborde has at least no inherited bias, and his temperately though firmly asserted opinions help singularly to lift the reader out of the region of controversy, and to shed light, where light is possible, into dark places. So, also, in doubtful matters connected with Italian schools of engraving, his calm judgment, fortified by experience, has persuasive power, especially as his opinions are always supported by reasonable arguments. M. Delaborde's volume opens with a discussion of one of the most hotly-disputed of all artistic questions involving national claims—namely, whether priority in the discovery of chalcography belongs to Germany or to Italy. In his opinion the printing on paper from a metal plate is an accidental and secondary fact, which may have occurred almost simultaneously in Germany and Italy; but as he considers the actual date of a print of little consequence in comparison with its comparative merit, he is unwilling to acknowledge that the famous Pax of Maso Finiguerra (1452), from which a unique impression exists in the National Library at Paris, has lost anything of its historic value by M. Renouvier's discovery of the German Passion suite of 1446, now in the Berlin Museum, the clumsily-executed work of an anonymous image-maker. He agrees with M. George Duplessis in considering the Florentine Pax to be the first real work of art in engraving, and therefore regards Maso Finiguerra as the real inventor of the process. Here we may note that while these gentlemen thus endorse Finiguerra's claims, Bartsch, Renouvier, Lippmann, and other authorities doubt their validity, and Passavant goes so far as to suggest that Finiguerra may have learned to take impressions of engraved work on paper from Roger van der Weyde, who visited Italy about the middle of the fifteenth century. In his argument M. Delaborde prefers æsthetic to strictly chronological grounds. Finiguerra, he says, invented engraving, since he

was the first to divine and reveal its real resources—the first to raise a simple industrial process to the height of a means of expressing the Beautiful. At the same time, he does not refuse their share of honor to the early German engravers—witness the following passage: "So long as nothing is shown but that which is shown, so long as nothing is found (and this is impossible) among the prints anterior to the second half of the fifteenth century equal in merit to the prints engraved a few years later, Finiguerra and his associates in Italy, the master of 1466, and Martin Schongauer, in Germany, will rightfully maintain the reputation which these prints have obtained for them, and the rôle which has been attributed to them." We do not deny, he says elsewhere, that engravings with the burin were made in Germany or the Low Countries before Finiguerra, but that in Italy or elsewhere any engraver before him had done really artistic work. He was the first in Italy who multiplied engraved work by pressure, and thus his Pax impression marks in some sort the official birth of engraving in Italy.

Xylography is accepted by our author as a German invention, and about this there can hardly be two opinions, as no Italian woodcut is known of so early a date as the Buxheim St. Christopher (1423); as the first German blockbooks were printed about twenty-five years before the first Italian work illustrated with woodcuts (1467); and, finally, as the playing cards with stamped and painted figures, whose importation was prohibited by a Venetian edict in 1441, were in all probability stencilled and not printed. It does not, however, follow, that the earliest Italian book-illustrations, those which adorn the pages of the 'Meditations' of Juan Torquemada (Rome, 1467), are of German design, as claimed by Lippmann, although the book was printed by a German printer, Ulrich Han. These illustrations, as M. Delaborde points out, reproduced the paintings executed by order of Cardinal Juan Torquemada on the walls of the cloister of S. Maria Maggiore, at Rome. The peculiar manner of treating draperies, the costumes of the figures, the cypress trees introduced in some of the backgrounds, and the general style, all attest their Italian origin.

We must refer those who are curious as to M. Delaborde's opinions upon the so-called Tarrocchi cards, the Monte Sancto di Dio, and the illustrations to Landini's Dantesque treatise, which pass under the name of Baldini as the engraver and of Botticelli as the designer, to the pages of his book in which they are discussed. There, too, he will find mention of Robetta, of Pollajuolo, and of Mantegna, the most inspired and the most able of all engravers before Marc Antonio. Of all his predecessors, Mantegna (says M. Delaborde) best deserves to be called a master of the first rank, from his elevated feeling and the originality of his style. Unlike Marc Antonio, who had a Raphael at his elbow, he drew everything from himself. His processes were poor; his want of experience in the treatment of light and shade was great; but, under a rough exterior, what a force of sentiment and poetry is perceptible! In the history of art, his name personifies "une âme, et une âme d'élite."

The Destructive Influence of the Tariff. By J. Schoenhof. G. P. Putnam's Sons. 1883.

DURING the summer of 1882 Mr. Schoenhof contributed to the *Evening Post* a number of letters entitled: "A Tariff for Protection—Of What?" These letters have been reprinted, with some additions, and are now published by the Messrs. Putnam for the New York Free Trade Club under the title given above. They make a convenient little volume of about 100 pages, packed with well-arranged figures and condensed arguments. The chief significance of the book is that it is the work of a manufacturer and appeals directly to manufacturers. The familiar cry of "doctrinaire" and "theorist" cannot be raised against such an author, and the Free Trade Club can do no more effective work than to press the circulation of this book among millowners. Sweet are the uses of adversity, and, if the present deplorable state of business shall open the eyes of the "protected" to the ruinous consequences of their stupid greed, we may well rejoice in it. The evidence is overwhelming that nearly every protected industry suffers more from the duties levied on its raw materials than it can possibly gain from the duties on its finished products. At the best it can secure only the home market, for protective duties do not help it when it tries to export its products, while the duties on its materials hinder it. Hence, as Mr. Schoenhof graphically shows, when there is any overproduction, a fierce and suicidal competition arises for the home market. The disturbance, which under natural conditions would be modified by its diffusion through the markets of the world, is pent up and intensified by our barbarous restrictions, until goods are slaughtered like stocks in a Wall Street panic.

The generous and enlightened spirit displayed by Mr. Schoenhof upon the subject of high wages is one of the most attractive features in his book. English manufacturers, although free-traders, are too apt to mourn over the high wages that they are compelled to pay in comparison with the low wages of France and Belgium. They look at the matter not only from the point of view of the capitalist, but also with the bias of the capitalist. Mr. Schoenhof writes as a capitalist, but with none of the hard, narrow feeling of the "master." He recognizes and emphasizes the fact—which is, to be sure, a truism with economists—that high wages mean highly productive labor, and that there is more profit in employing intelligent, skilful, and efficient workmen, and paying them well, than in employing bad workmen and paying them poorly. As he says, the use of machinery has wrought a revolution in economics. Where machinery is little used, labor is degraded; or rather, where machinery is much used, labor is elevated. Hence the figures industriously collected by the protectionists through the Department of State and otherwise, showing the low rates of wages in foreign countries, are ingeniously turned against them by Mr. Schoenhof, who proves that in the nail-making industry, for example, the labor cost in American-made goods is about 35 per cent. less, while the earnings of the laborer are 350 per cent. more, than in the Taunus district in Germany. This portion of his work is admirably executed, and is full of excellent ammunition for free traders. The excessive stimulation of the tariff has resulted in congestion. Manufacturers are now crowding each other so hard that an extremely irritable state of mind is prevalent among them, and there are abundant signs that the league that has so long dictated the legislation of Congress is in danger of disruption. Should the leaders once fall out, there would be a chance for some other members of the community to get their dues. We trust that the arguments of Mr. Schoenhof may effectively contribute to this end.

The Storied Sea. By Susan E. Wallace. Boston: James R. Osgood & Co.

THIS is one of the books which have no other apparent cause of existence than the itch for writing, and have yet no artistic quality which justifies the critic in putting them on the shelf of the Permanent. But for the air of forced gayety which pervades it we might class it as a cricket abroad: its chirp is attractive when you hear the first note, but becomes wearisome and betrays imitation, run through a volume even as short as is this. As romance, it lacks the dramatic quality of invention, and as travel it lacks the objective veracity. It is neither keen as observation nor just as reflection, and what strikes one above all things is that the authoress went out decided to see certain things and came home to write what she wished she had seen. A book of superlatives, even of Victor Hugo's, must weary even a patient reader, and we are willing to acknowledge that a very few chapters of 'The Storied Sea' satisfied our appetite for the marvellous. The best excuse for the unmitigated sparkle of the not costly gems is that they appeared as newspaper letters, and have not been worked together.

Building Superintendence: a Manual for Young Architects, Students, and Others Interested in Building Operations as Carried On at the Present Day. By T. M. Clark, Fellow of the American Institute of Architects. Boston: J. R. Osgood & Co. 1884. 12mo, pp. 336.

DETAILS of construction and patented appliances change so fast that works on building, like those on other practical arts, quickly become obsolete. The growth of the subject and the need of watchfulness in keeping up with it are well illustrated in the introductory note to Prof. T. M. Clark's 'Building Superintendence,' which tells us that "between the stereotyping of the first and last chapters" the progress of experiment made it necessary to double the factors of safety used in computing beams from the ordinary constants. The way of the young superintendent is hard, and no amount of teaching will take for him the place of personal experience; but Prof. Clark's admirable book will give him a model of orderly procedure and of the minute care-taking which the planning and oversight of building work require, and a manual, as complete as can easily be, of the complicated details of building construction. It is a reprint of articles published in the *American Architect*, apparently stereotyped without alteration from the forms of that journal. Its method is that of Viollet-le-Duc's 'Histoire d'une Maison,' but leaving out the thread of narrative on which that is strung, and simply describing the progress of construction seen in the successive visits of a supposed inspector. This method, indeed, soon lapses, and the book becomes merely an essay on building. In spite of a more direct and business-like tone, we think the book loses by the change, for the first form leads the writer to suggest a variety of expedients called out by emergency, and to describe many of the tricks and evasions by which the ordinary workman tries to blind an inexperienced superintendent. This gives the young reader just the invaluable lessons he would ordinarily get only from practice; but the change of method transforms the book into a manual of specifications—a thing which has been made many times before, if not quite so well as Professor Clark does it.

Perhaps the equilibration of the arch, on pp. 278-285, and the discussion of roof strains which follows, might have been omitted with no worse effect than to suppress a few of the 336 pages in the volume. We should dread trusting any tyro with an important construction on the strength of his understanding of these discussions. If they simply impressed on him the idea that strains must be accurately computed by

some one who knows how, it would be well. But to encourage him to think that he could do so by mere imitation would be disastrous. Too much of such work is done by rule-of-thumb; and the Sisyphus labor of trying to present mathematical things in an unmathematical way is, we believe, worse than thrown away.

BOOKS OF THE WEEK.

Ladreyt, Marie-Casimir. L'Instruction Publique en France et les Écoles Américaines. Paris: Hetzel; New York: F. W. Christern.
McLaughlin, M. Louise. Suggestions to China Painters. Cincinnati: Robert Clarke & Co. $1.
Munger, T. T. Lamps and Paths. Sermons. Boston: N. J. Bartlett & Co. $1.
Norris, W. E. Thirlby Hall. A Novel. Harper & Brothers. 25 cents.
Rose, H. Ten Years: An Old World Story. Poetry. G. P. Putnam's Sons; London: James Nisbet & Co. $1.50.
Sumner, W. G. Problems in Political Economy. Henry Holt & Co.
Thackeray, W. M. Christmas Books. John W. Lovell Company. 20 cents.

THE CENTURY CO., New York, N. Y.

Edinburgh and Quarterly Reviews.

Messrs. HOUGHTON, MIFFLIN & Co. take pleasure in announcing that they have the exclusive sale in America of the original editions of these two leading English Quarterlies:

THE QUARTERLY REVIEW,
Published by JOHN MURRAY.

THE EDINBURGH REVIEW,
Published by LONGMANS & Co.

These are published in America by special arrangement with the English publishers. *They are not reprints, but are the original English Editions, printed from the same plates and on the same paper as copies circulated in England by the British publishers.*

The price of each is $4.00 a year; the price of single numbers, $1.00.

For the QUARTERLY REVIEW and the EDINBURGH REVIEW together, $7.00. For either of these Reviews and THE ATLANTIC MONTHLY, $7.00. For both of these Reviews and THE ATLANTIC, $10.

HOUGHTON, MIFFLIN & CO., Boston.
No. 11 East 17th Street, New York.

"THE ATLANTIC, dependent alone on reading matter for its success, is brilliant above all others in this respect, and never has been so fresh, so versatile, so genial, as it is now."—The Literary World.

February Atlantic,

Ready Saturday, contains:

S. WEIR MITCHELL — In War Time. The third and fourth chapters of a striking Serial Story.

F. MARION CRAWFORD—A Roman Singer. One of the most noteworthy Serial Stories ever published in an American magazine.

HENRY JAMES—En Province,

O. B. [illegible]THINGHAM—Voices of Power: the [illegible] Press, and the Stage.

EDWARD G. MASON—A Visit to South Carolina in 1860.

ELIZABETH ROBINS—The Vagabonds and Criminals of India.

H. BERNARD CARPENTER—A Trio for Twelfth Night.

Other Essays, Poems, Reviews, and Contributors' Club.

35 Cents a Number; $4 a Year.

HOUGHTON, MIFFLIN & CO., Boston.
11 East 17th Street, New York.

Lippincott's Magazine

FOR FEBRUARY,
NOW READY, CONTAINS:

OLD GERMANTOWN. With Illustrations from Drawings by Joseph Pennell.
FRENCH CHATEAU LIFE, PAST AND Present. By ANNIE HAMPTON BREWSTER.
A MENTAL MASQUERADE. A Story. By ESTHER WARREN.
AN INDIAN CATTLE-TOWN. By ALFRED M. WILLIAMS.
THE GREAT JIGTOWN FAILURE. A Story. By C. F. JOHNSON.
A PILGRIMAGE TO SESENHEIM. By HORATIO S. WHITE.
ON A GLASS ROOF. Winter Fishing. By ROWLAND E. ROBINSON.
EXPLAINED. A Story. By ALICE BROWN.
HEALTHY HOMES. II Surroundings. By FELIX OSWALD.

Also a charming Serial Story, entitled SEBIA'S TANGLED WEB, by LIZZIE W. CHAMPNEY. Other Short Stories, Poems, and Articles of Interest upon Current Topics.

FOR SALE BY ALL NEWSDEALERS.

25 cents per copy; $3.00 per annum.

Address Publisher of the *Nation*, Box 794, New York.

The Nation.

NEW YORK, THURSDAY, JANUARY 24, 1884.

The Week.

It is said in Washington that any proposal of retaliatory measures by the European governments affected by our art tariff will result in adverse action by Congress rather than in a removal of the art tariff, as our people will not tolerate menaces. Yet the same people are preparing a retaliatory menace against the German pork measures. Suppose the Germans to be as irascible and impatient of menace as we, and their Government to respond to our hog threats by substituting a fixed duty on hog which will be practically prohibitive and put our pork out of the frying-pan into the fire! What can we reply? In our legislative wisdom we accept treaties of amity and commerce, and then we show our amity by making the commerce only possible on one side. We want the Germans, Italians, and French to take our pork, cotton, wheat, etc., with no duties, and we refuse to accept what might be sent us in return, on the ground that we must develop and protect our own production of the same articles, so that we may escape that mutual interdependence which is the basis of commerce. We begin a war of menaces, carry it on by a competition of prohibitory tariffs, and may find ourselves in a few years in the state of China, shut out from the rest of the world, refusing the products of other nations and they refusing ours. This is the logical and may be the practical result of our protective policy, which means, carried out in full, the extinction of commerce.

A movement is under way to have Mr. Hewitt's call upon the British Minister investigated by a Committee of Congress, and the "tail-twisting" statesmen, Messrs. Cox, Robinson, and Finerty, are credited with a determination to probe the matter to the bottom. Their zeal in the affair is attributed to various causes, one of which is an interest in promoting the Flower boom in opposition to the Hewitt boom. It is said of the advocates of the Flower boom that they are determined to crush Hewitt by showing that he has been trifling with the Irish vote. With Hewitt out of the way, Flower is expected to come to the fore as the strongest New York candidate for the Presidency. His claims are somewhat peculiar. They are sent out from Washington in the following order: He is worth from four to five millions of dollars; he served one term in Congress and made himself popular by the novel expedient of dividing Congressmen into squads of a dozen each and dining them sumptuously; he made two or three speeches, which gave him a position as a judicious, constitutional statesman, and had them printed; then he declined a renomination, and devoted himself to running for the Presidency on his "record." One of the speeches was circulated in this part of the country a few months ago, and we remember it distinctly as one of the most thoroughly "constitutional" efforts we have ever had the pleasure of perusing. It was, if we recollect rightly, a neat little pamphlet of about thirty pages. Ten of them consisted of an argument in favor of a bill, and the other twenty of the entire Constitution of the United States, prefaced with some such introduction as this: "In this connection I cite the Constitution of the United States, a document which cannot be read too often by the people of this great and glorious country."

Mr. C. P. Huntington is involved in a litigation which promises to throw some more light upon what are known as his "railroad methods." The suit is one brought by Mrs. Colton, widow of General Colton, to set aside a settlement made by Huntington and his associates with the Colton estate. The settlement was intended to cover transactions in railroad affairs in which Colton had been the agent of the syndicate for a number of years, and, in settling, the syndicate reduced the amount by some millions, on account of wholesale embezzlement practised by the General, as they alleged, in the course of his agency. The charge of embezzlement seems to have been based on the fact that the General received large amounts of money from the syndicate which he never accounted for. But the General's widow, thinking the matter over since, has come to the conclusion that, in "railroading," the receipt of money by a confidential agent who does not account for it is by no means conclusive evidence of fraud, and that there being no vouchers to show what became of it is merely strong proof that the agent did with it what was meant by his principals to be done.

To give "color," as the lawyers say, to this view of the matter, she has been engaged in an analysis of Mr. Huntington's own accounts, and has produced proof that in the years 1876–'78–'79 he spent in the course of business $409,335.67, for which no vouchers exist, and the use of which he cannot explain, except that it went to "agents and attorneys." The connection of this with the Colton litigation becomes apparent when we learn that it was during the period of this expenditure that Colton ("Friend" Colton, as he then was) was one of the agents of Huntington, and that Huntington himself was engaged in active railroad work against Tom Scott and his Texas-Pacific scheme. The nature of the work the letters to Colton make very plain. It is this correspondence from which we have already made copious extracts, and in which he speaks of his rival having "switched" off two Senators in one week, but reminds his agent that they can be "switched back with the proper arrangements when they are wanted." Switching off and switching back Senators would, we suppose, come properly under the head of operating expenses, though the most experienced men sometimes find it hard to discriminate between these and the construction account. Anyhow, it seems a strange suit to come before a court of justice—embezzlement on one side, met by the explanation that the money was not stolen, but used to corrupt Congressmen.

The House passed on Monday, under the lead of Mr. Holman, and by an almost unanimous vote (256 to 18), a resolution with regard to the land policy of the country the point of which lies wholly in the "application" of it. The first statement in the resolution consists of the legal platitude that "all the public lands heretofore granted to States and corporations to aid in the construction of railroads, so far as the same are subject to forfeiture by reason of the non-fulfilment of the conditions on which the grants were made, ought to be declared forfeited to the United States and restored to the public domain." This is followed by a statement that the land laws should be so framed and administered "as to ultimately secure freeholds therein to the greatest number of citizens," and that "to this end all laws facilitating speculation in the public lands, or authorizing or permitting the entry or purchase thereof in large bodies, ought to be repealed, and all of the public lands adapted to agriculture subject to bounty grants, and those in aid of education ought to be reserved for the benefit of actual and bona-fide settlers, and disposed of under the provisions of the Homestead law only." Finally, the Committee on Public Lands is directed to report at any time bills carrying these views into effect.

The Committee has under this resolution determined, it is said, to recommend the forfeiture of the land grant of the Texas-Pacific Railroad, including about 15,000,000 acres, on the ground that the recently published Huntington-Colton correspondence shows that the Texas-Pacific consolidated with a "hostile" road, in violation of the terms imposed by the grant. There is one objection to legislation of this kind which its promoters seem to overlook—Congress cannot resume lands once granted for forfeiture without passing upon a legal question affecting the rights of thousands of innocent persons who have settled upon the lands in the faith that their titles would not be upset. In doing so, moreover, it acts as judge in its own case. The Huntington-Colton correspondence seems to warrant an investigation, with a view to future legislation; but to use it in its present condition for such a purpose is hasty. The good and wise author of the memorable propositions which have set the Committee in motion will no doubt be among the first to protest against proceedings which look so much like confiscation.

The House Committee on Accounts, which has been investigating Keifer's performances with the stenographers at the close of the last session, has discovered that his nephew drew $3,850 from the Government for which he performed no service whatever. The

drawing of the pay was the least objectionable part of the transaction. Keifer forced one of the stenographers to resign after the work had all been done, and then put his nephew in the position so that he might draw the vacation salary which the stenographer had earned. When the latter protested, Keifer told him that he had nothing to complain of, since he could go to New York and get work on some of the newspapers, while his nephew, not being competent to earn anything, wanted the money in order to enjoy the summer. The stenographer, who was in poor health, had to give up his vacation and go to work on a newspaper. Keifer's conduct in the matter was about as contemptible as it could be, and the House will simply perform an act of justice if it compels him to refund to the cheated stenographer the money which he had earned.

Governor Robinson, of Massachusetts, wants "concurrent action" on the subject of divorce taken by the various States. No respectable State or person can possibly object to this, but there is, as we have frequently ventured to suggest, an excellent way of securing concurrent action, and, what is more, making it permanently concurrent, known as the passage of an amendment to the United States Constitution. Short of this we know of no way unless by a great national movement for the adoption of an identical constitutional amendment in all the States at once. Concurrent action by the Legislatures of States which have been steadily diverging in their marriage laws for a hundred years, we can hardly otherwise expect. Those who talk of it in such a matter seem to overlook the fact that even supposing that all the States were to enact an identical law on the subject, and that the Legislatures were never to repeal or alter it, still the fact that a marriage in New York was a New York and not a United States marriage, and a divorce in Connecticut a Connecticut and not a United States divorce, would remain. All the old difficulties, arising, not from difference of laws, but from difference of jurisdiction, and consequent differences in the judicial interpretation and application of laws, would remain. Besides all this, the idea of unanimous concurrent action in the case of States whose whole policy concerning marriage and divorce is radically different, may be dismissed as impracticable. In New York the only cause for absolute divorce is adultery. In States near by there are half-a-dozen. No concurrence is to be expected from such States. What is needed is a vote the result of which will be binding upon them even if they do not concur—*i. e.*, a constitutional amendment applicable to all the States.

A singular delusion on the subject of copyright occasionally comes to our notice in the columns of esteemed contemporaries—that the law of England discriminates against American authors. Thus the St. Paul and Minneapolis *Pioneer Press* publishes a long article in favor of the general principle of international copyright, but containing the following odd question: "Since when have not British copyright statutes contained a provision refusing protection to works copyrighted outside the realm of Great Britain?" If the *Press* will consult any standard work on copyright, it will find that the English copyright law has contained no such provision for many a long year. By the present law of England any country which gives reciprocal rights can secure international copyright with Great Britain, a series of international copyright acts having been passed for this purpose during the last forty years, which it will find enumerated in Mr. Drone's well-known treatise on copyright, at page 214.

But this is not by any means the whole of the case. The American author can now get an English copyright by first publishing in England, for the domestic law gives copyright to any author without regard to the place where he was born, on the very sensible ground that every author who is induced to publish there does something for the promotion of literature. During the discussion of the whole subject in 1878 by the Copyright Commission, a proposition of retaliation was brought forward, the treatment of which by the Commission is interesting reading just now in connection not only with books, but with the American-hog and French-claret retaliation scheme. They said: "It has been suggested to us that this country would be justified in taking steps of a retaliatory character, with a view of enforcing incidentally that protection from the United States which we accord to them. This might be done by withdrawing from the Americans the privilege of copyright on first publication in this country. We have, however, come to the conclusion that, on the highest public grounds of policy and expediency, it is advisable that our law should be based on correct principles, irrespectively of the opinions or the policy of other nations. We admit the propriety of protecting copyright; and it appears to us that the principle of copyright, if admitted, is one of universal application. We therefore recommend that this country should pursue the policy of recognizing the author's rights, irrespective of nationality."

The acquittal of Nutt was what might have been expected after the acquittal of Dukes. One is about as bad a failure of justice as the other. If there be any difference, it is in favor of the Dukes acquittal. There was some shadow of reason for believing that the killing of Captain Nutt by Dukes was not wholly premeditated; but there is no doubt at all that the killing of Dukes by young Nutt was a premeditated murder. Moreover, the acquittal of Nutt is much more dangerous as a precedent than the acquittal of Dukes, because it is doubtless based on the opinion that he did right—that is, that there are reasons besides the defence of life and property which will legally justify manslaying. In truth, it is difficult to avoid the conclusion that there is of late all over the country, not only among juries, but in the press, and among plain people, a distinct decline in the sense of the sacredness of human life, and a distinct increase of readiness to take it, or condone the taking of it, unlawfully, as a remedy for various ills and wrongs. Lynching in punishment of real or suspected crime has, of late, apparently become more common in some of the not very Western States. The street murder has become more common at the South, and the public of the Eastern States looks certainly with greater indulgence than it did twenty years ago on the use of the pistol.

Some of the discussions on criminal jurisprudence which appear in the Western papers are of the most extraordinary character. The Chicago *Inter-Ocean*, commenting on Nutt's trial, maintains that he ought not to have been tried for murder, but for "the usurpation of judicial functions," or for "performing in an irregular manner an act of justice." It also wants to revive an old English process of 300 years ago, in Elizabeth's day, which it says it has discovered, called "the right of trial by appeal." Under this remarkable right, "Nutt could have obtained a judgment of an English court delivering over Dukes into his custody to be by him executed, shot, or hanged, as Nutt thought proper." It also severely criticises "Parliament" for repealing this "quasi right of the relative" as "too provocative of vindictive feelings." It finds only one excuse for Parliament—namely, that, in repealing a remedy which had so long existed, it "doubtless never occurred to it that it could not repeal those instincts of human nature to which the remedy owed its origin and its justice." Such articles as these, however, are far more likely to fix the attention of "Parliament" on the liquor question and the proper treatment of the insane than on the ancient Elizabethan "right of appeal."

A promising public career has been brought to an untimely end in New Jersey, by the sentence of ex-Speaker Egan to the Penitentiary for attempting to bribe a member of the Legislature. When Mr. Egan was elected Speaker of the New Jersey Assembly a few years ago, his portrait was published, and with it an eloquent biographical sketch, in which he was depicted as "one of the galaxy of young men of this country who have cleared their way to prominence by the force of their natural talents, aided by honesty of purpose and devotion to principles." The force of his natural talents encountered its first serious obstacle last winter. Mr. Egan was at Trenton as a lobbyist, and in the course of legislation it became necessary for him to secure the defeat of an obnoxious bill by bribing the chairman of a committee to desist from pressing it. He called upon the chairman at his house, and in a perfectly straightforward manner told him that if he would allow the bill to be "smothered" he could name his own price, and the interest which Mr. Egan represented would pay it. The chairman rejected the proposal, and told Egan that he should expose his conduct before the Assembly. Egan replied that he should not mind that since only they two were present at the interview, and his word and oath would go as far as the chairman's. But here is where the deception came in. The wife of the chairman was in the back parlor and overheard the whole conversation. In the investigation which followed, she corroborated her husband's testimony, and Egan was found guilty. The Grand Jury took up the matter and indicted him. He pleaded guilty,

and has been sentenced to one month's imprisonment and $500 fine. As the sentence carries with it disqualification for holding public office hereafter, the State has lost the services of an energetic statesman.

The speculation in grain seems to have culminated, and prices have been on the decline, as the investors in wheat and corn have seen their mistake and have been trying to sell out. But the accumulation of money in the banks is greater than ever. The last weekly statement of the New York banks showed an increase of $7,327,000 in the deposits, and an increase of $4,964,400 in the specie and legal tenders. At the same time the surplus reserve held by the New York banks over their required 25 per cent. was $17,284,225, being the largest since July, 1880. Rates of interest are as a consequence lower than ever before at this season of the year. The further disturbance of confidence caused by the recent collapse of the North River Construction Company, the great decline in West Shore bonds, the application for a receiver for the New York, Ontario & Western, and the rumors of probable applications for other receiverships, in the last ten days, has led to a general decline in the prices of both railway stocks and mortgage bonds, and it is only within the last day or two that there has been any improvement in the tone of the markets for securities.

The story that Jay Gould is "embarrassed" has drawn his attention to the criminal law of libel as it affects those who circulate "disquieting rumors." In the present condition of the stock market and of business, he would probably have the sympathy of the community entirely with him should he be able to bring any enemies of this description to justice. His embarrassment would mean disaster in dozens of corporations, and general public calamity; and a false rumor circulated to get people to believe such a story is peculiarly wicked and criminal. The last time rumors of this sort were set afloat, he exhibited "securities" to prove that they were not true. But a prosecution would probably be far more effective.

The "barbed-wire fence war" which has broken out in Texas seems to be in part, if not wholly, a result of the sudden conversion of the State, by a great influx of population, from a thinly-settled community, with land of little or no value and used for grazing purposes very much in common, into a populous modern community, with land constantly increasing in value, and with exclusive private ownership becoming more and more attractive. The fence-cutters, or "blue devils," as they are called, represent the primitive Texas of the ante-bellum period, when horses and cattle were the only property of much consequence in the State, and before the idea of fencing in lands held on a great scale in the open parts of the country sprang up. The sudden development of property in land (which always comes later in civilization than that in cattle) would probably not have caused so much trouble had it not been for the great "fencing facilities" afforded by the barbed-wire fence. No one has ever seen this sort of fencing but has felt that it suggests capital and monopoly much more than the plain old rail, or even the board fence, universally used by all citizens fifty years ago; and it is evident that the blue devils or fence-cutters are endeavoring to give the fence war the air of a struggle between poverty and banded wealth. They represent the fences as invariably being put up by aliens, Northerners, monopolists, bloated capitalists, and as being torn down by themselves in the interest of the honest Texas yeoman. At one point the blue devils seem to be nearly in the right. The fencing in of the State has resulted apparently in some instances in blocking up roads; and had the devils confined themselves exclusively to reopening these even by violence, they would probably have been in the right. But a road even in Texas need not be more than a few hundred feet wide. Yet when the devils open a road they destroy several miles of fence. To those not actually engaged in the war it will be suggestive to learn that the authority of Henry George has been appealed to to settle the dispute, on the ground that if land is by nature the common property of all men alike, a fence is "agin natur'." Henry George, however, has never, we believe, advised a general destruction of fences in any of his works.

The change of Ministry in Spain is an event of considerable importance, as it probably points to a change both in the home and foreign policy of the Government. It is the result of the division of the Spanish Liberals, on whom the King has lately been relying, into a series of shades or groups that cannot be got to agree. The late Ministry of Posada Herrera was composed of what is called the Dynastic Left, or in plain English Monarchical Radicals. But it had to accomplish the almost impossible task of keeping on good terms with the Crown, and securing for it the support of the Radical or Republican Radicals. The King's speech at the opening of the session was made to favor not universal suffrage exactly, but a plan of slightly limited suffrage produced by the Sagasta Cabinet in 1882, which would have created a total of 3,014,000 voters, while real universal suffrage would have created a total of 3,650,000. The difference between the two figures was so slight that the Minister thought it was not worth preserving, and he accordingly declared for the latter, thus alienating the Liberal Centre, under Sagasta, who will not hear of a great extension of the suffrage even in the moderate form proposed in the King's speech. The Ministry hardly fared any better with the Extreme Left, as was shown by the manifesto of Ruiz Zorilla, of that group, proclaiming the incompatibility of the principles of the revolution with the monarchical form of government under the house of Bourbon. All this proved that the Minister no longer controlled the men of the Left who served under him when he was in opposition.

These troubles have been still further aggravated by the visit of the Crown Prince of Germany, and the supposed desire of the Ministry to draw closer to Germany in a sense hostile to France, which, as a Republic of the Latin race, is still dear to the Spanish Radicals. Then, too, the attempt to make a treaty of commerce with England, by alienating the Catalonian protectionists, still further increased the difficulty of the situation. In fact, Posada Herrera seems to have had the usual fortune of people who try to bring utterly irreconcilable political ideas to work in harmony. He has fallen after a session of much acrimonious debating, and much alarm, not simply about the fate of the Ministry, but about that of the monarchy itself. Nor has the situation been improved by the construction put by the German semi-official press on the Crown Prince's visit. Spanish Liberals of all shades, as well as Royalists, were but slenderly pleased to read in the *Alsace-Lorraine Gazette* that the visit of the Prince Imperial "was intended to fortify the monarchical idea in Spain against the republican demonstrations in Paris directed against a royal personage." The Spanish monarchy cannot afford to be bolstered up in this way. The return of the Conservatives to power under Canovas has been for some time predicted as the only possible way out of the difficulty created by the Liberal dissensions. It is likely to have two important consequences. It will probably bring about a renewal of negotiations for the admission of Spain into the German-Austrian-Italian alliance, and her consequent separation from France. If the Spanish people can be reconciled to this, it will be through an appeal to their pride. They have long chafed under the secondary position of the Spanish monarchy, and its exclusion from a seat among the great Powers. Admission to this alliance would do a good deal to soothe this wound to their susceptibility, as a sign of the returning weight of Spain in European councils. But it probably also puts an end to the pending attempts to make a commercial treaty with England. The Conservatives are Protectionists, and their most powerful support comes from the iron manufacturers of Catalonia.

The *Perseveranza*, of Milan, has an article on the recent supplementary elections under the new law extending the suffrage. Under the old system an average vote of one-third of the citizens qualified to vote was cast. As to the new, the *Perseveranza* says: "The number of the electors that took part in the elections was small enough in the past, and exceedingly small now that we have the extension of the suffrage. This shows how entirely artificial was the agitation which led to this extension." In four sections of the city of Bologna the election failed entirely, the voters not taking the trouble necessary to effect the primary organization; and Bologna is one of the most solid centres of Italian liberalism. It is clear that one of two alternatives obtains in Italy—either the form of government or its general attitude toward the population inspires no confidence in the voting classes, or they are indifferent as to how the country is governed. In the former case a revolution will be the inevitable consequence of the first great national depression or disaster.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, January 16, to TUESDAY, January 22, 1884, inclusive.]

DOMESTIC.

IN the Senate on Wednesday Mr. Hoar's bill, relative to the electoral count, was passed without debate, in order to get it before the House as soon as possible. It is the bill which passed the Senate last year. Mr. Beck, of Kentucky, proposed an amendment to the Anthony retaliatory resolution on the same day, which may open the entire tariff discussion. He proposed that the Foreign Relations Committee should inquire whether or not France, Brazil, Mexico, or other countries have discriminated against exports to the United States. The resolution is directed at the export duties on coffee, sugar, and other products sent to the United States.

The Senate on Tuesday adopted the Anthony retaliatory resolution, amended so as to require the Committee on Foreign Relations to prepare such legislation as shall tend to protect American exportations of meat to France and Germany.

The opponents of the Mexican treaty made a vigorous fight in Washington to prevent its ratification by the Senate, which had to be effected before January 20th, or the treaty failed. The opposition claimed that the treaty was not a bona-fide commercial one, but a "job" which would be worth $50,000,000 to its promoters in the next few years. The Senate on Friday, in executive session, refused to ratify it by a vote of 39 to 20, a two-thirds vote in its favor being required. A motion to reconsider it was then made, but the Senate adjourned until Monday before acting upon it. The advocates of the treaty became again encouraged when they learned that an agreement had been signed with the Mexican representative in Washington by which the time for the ratification of the treaty had been extended six months, or until July 20th. The greatest difficulty in the way of securing the ratification of the treaty is the provision which admits tobacco free. This has secured for it the solid opposition of Connecticut, Pennsylvania, Virginia, and West Virginia. The assumption has been that the treaty would not only permit the free importation of tobacco, but would also relieve it from internal taxation. The friends of the treaty are so anxious to have it ratified that it is believed they may be willing to sacrifice tobacco.

A resolution was made on Monday in the Senate that any further debate on the treaty be had with open doors. It was declared out of order to offer such a resolution in open session, and when considered in secret session it went over under the rules.

In the House of Representatives a storm was raised on Wednesday by a resolution introduced by a Republican calling for an investigation of the method of Mr. Payne's election as U. S. Senator from Ohio. This was promptly voted down. Resolutions were passed on Thursday calling upon the Postmaster-General and Attorney-General for reports and documents relating to the Star-route prosecutions. An investigation is aimed at. The bill appropriating $1,000,000 for the improvement of the Mississippi River passed the House on Thursday by a vote of 215 to 64. On Friday afternoon the House went into Committee of the Whole on the Fitz-John Porter Relief Bill. The discussion was continued until Tuesday evening, without a vote being reached.

The House on Monday voted to repeal the iron-clad oath, Mr. Boutelle (Rep., Me.) alone voting nay. It also, by a vote of 261 to 18, passed a resolution declaring that the forfeitable grants of land for railroad purposes ought to be forfeited and the lands restored to the public domain; that all laws under which public lands may be acquired by speculators ought to be repealed, and the remaining public lands be held subject to homestead entries only, and that the Committee on Public Lands be instructed to bring in bills to accomplish the objects mentioned.

A resolution intended to purify the floor of the House from lobbyists was introduced on Monday. It provides that it shall be the duty of the Speaker to ascertain the nature of the business of ex-members on the floor, and that in case they are found to be engaged in lobbying he shall exclude them.

Mr. Shaw, of Illinois, a Democratic Representative, has introduced a bill in Congress to repeal the Civil-Service law, similar to the Clay bill mentioned last week. When asked for his reasons for introducing such a bill he replied: "I want to get our fellows in, and get this law out of the way. It is contrary to the spirit of our institutions. I do not think the President or anybody has any right to interfere in any such way with the patronage, and do not want to be dictated to by any commissioners in any such manner."

Senator Edmunds, at a meeting of the Senate Committee on Post-offices and Post-roads on Thursday, in a conversational way gave his views on several points involved in the consideration of the Postal-Telegraph Bill. He entertained no doubt in regard to the constitutional right of the Government to build telegraph lines. He was strongly opposed to the purchase of existing lines. His views on the remaining features of the subject were substantially those embodied in his bill. The telegraph interests will be heard by the Committee through representatives.

At a meeting of the House Committee on Appropriations on Monday, it was decided to report a bill for the appropriation of a sum necessary to fit out a Greely relief expedition. The measure covers the recommendations of Secretaries Lincoln and Chandler, providing for three vessels. The President is authorized to fit out the expedition as soon as possible. The bill passed the House on Tuesday.

The President on Monday nominated A. S. Worthington to be United States Attorney for the District of Columbia, vice George B. Corkhill. Mr. Corkhill was prominent in the Guiteau trial as Government counsel.

Senator-elect Payne, of Ohio, gave a dinner at Columbus on Thursday evening to his supporters in the Legislature. He made a long speech defining his views. He favors a reformed tariff, but not free trade. As to the civil service he said: "The process of reform is, first, by electing a Democratic President—and that is assured the present year, unless unwisdom and madness from the gods are permitted to block the way. Secondly, by a pitiless and radical overhauling and purging of the present service."

After balloting for several days the Democrats of the Maryland Legislature on Friday elected Judge E. R. Wilson to the United States Senate to succeed Mr. Groome.

Francis W. Rockwell (Rep.) was elected from the Twelfth Massachusetts Congressional District on Thursday to succeed Mr. Robinson, who resigned to accept the Governorship of that State.

The Republicans in Congress held a caucus on Wednesday evening to prepare for the coming Presidential campaign. Senator Edmunds said that in his opinion the outlook of the Republican party for success next fall had not in fifteen years been so promising at this early stage of the campaign as it is now. A resolution presented by Senator Hoar was adopted, extending "sympathy and coöperation" to all persons in the South who are "struggling to exercise the vital and fundamental right of free suffrage." A Congressional committee was partly agreed upon.

The primary elections of the Republicans in this city on Friday evening, under the new plan of organization, resulted in a practical victory for the Machine, fifteen of the twenty-four districts remaining completely in their hands.

After a long deadlock, Alderman Kirk (Tammany Democrat) was elected President of the Board of Aldermen of this city, on Monday, by a combination between the Republican and Tammany members.

The Senate and Assembly Committees began their investigations of the Public Works Department in this city on Saturday. Commissioner Thompson appeared before them and testified in his own behalf.

Several similar bills, likely to create considerable discussion, are before the Public Health Committee of the Assembly. They provide for the establishment of a Medical Faculty as an attachment to the Board of Regents of the University. The proposed Medical Faculty is to consist of nine members. One bill directs that the Faculty shall be appointed by the Board of Regents, but one of the other bills gives the appointment to the Governor, without regard to confirmation by the Senate. Six of the members are to be taken from the "school" having the largest number of practitioners in the State, two from among the next largest class, and one from the next largest. That is to say, it is fair to assume the "allopathists" are to have six of the nine members of the Faculty, the homœopathists two members, and all the others one. Under one bill, the candidate for authority to practise medicine will have to apply to the Board of Regents. Thence he will be turned over to the Medical Faculty, where he will be subjected to examination by a subordinate board of three examiners appointed by the Faculty. For the purpose of conducting the examinations, semi-annual meetings of the Faculty are required to be held at New York or Albany.

At Albany, on Wednesday, Speaker Sheard announced the committee of five to investigate the Public Works Department in this city. Mr. Roosevelt is Chairman, and the remaining members are good men. In the Assembly, Mr. Moore introduced a bill for producing revenue for the State Government. It provides that the funds shall be raised by direct tax on corporate franchises or the business of railroads, insurance, trust, guarantee, express, telegraph, telephone, steamboat, car, and transportation companies, and banking institutions in the State. The Governor shall appoint, with the consent of the Senate, a Commissioner of Taxes for three years. The bill creates a State Department of Taxes with the necessary clerks.

Mr. Howe's bill for the appointment by the Governor of a commission of five to examine into and report upon the present contract system of prison labor was passed by the Assembly on Thursday by a vote of 74 to 41. The opposition was Democratic.

As a result of the recent conference with Pope Leo, each of the American bishops in Rome has received printed instructions in regard to the future course of the Church in this country. These instructions will be conveyed to the Plenary Council to be convened in Baltimore in November next, where they will be debated and perhaps amended, and then returned to Rome for the Pope's approval as canon law for the United States. They relate to higher education for the priesthood, the appointment of episcopal consultors to be known as Canons, the method of nominating episcopal candidates, and the improvement in the method of pastoral visitation. It is intimated, though not affirmed, that Archbishop Gibbons, of Baltimore, will be the next American Cardinal.

Mr. Robert Harris, Vice-President of the New York, Lake Erie, and Western Railroad, and formerly of the Chicago, Burlington, and Quincy Railroad, was unanimously elected by the Directors President of the Northern Pacific Railroad on Thursday, to succeed Mr. Villard. He accepted the position.

Ex-Speaker John Egan, of the New Jersey

Assembly, who recently pleaded guilty to an indictment charging him with having attempted to bribe Assemblyman Armitage, was sentenced on Thursday at Newark to imprisonment in the County Jail for thirty days, and to pay a fine of $500 and the costs of prosecution.

The defence in the Nutt murder trial, which was opened on Wednesday, set forth the plea of mental imbecility aggravated by the excitement attending his father's murder. His family physician, mother, and other witnesses were called to substantiate the plea. The case was closed on Monday and given to the jury, who brought in a verdict of acquittal the next day.

Charles Delmonico's will leaves his property to his sister, two nephews, and a niece.

The steamer *City of Columbus*, which sailed from Boston on Thursday for Savannah, went ashore on Devil's Bridge, off Gay Head, at 3:45 A. M. on Friday, and at once began breaking up. She carried fifty-nine first-class and twenty-two steerage passengers, and a crew of forty-five. Of these, fifty-five first-class and fourteen steerage passengers, and twenty-eight of the officers and crew, were lost. Gay Head is a promontory forming the western extremity of the island of Martha's Vineyard, twenty-two miles from Edgartown.

William H. Guion, late of the steamship firm of this city, made a personal assignment on Saturday. His liabilities are about $200,000. The firm is not affected.

FOREIGN.

General "Chinese" Gordon started on Friday night for Egypt on a special mission, after a long conference with the Duke of Cambridge and Lord Wolseley. The immediate purpose of the mission is to report upon the military situation in the Sudan, and to provide in the best manner possible for the safety of the European population at Khartum and the various Egyptian garrisons; also to conduct the evacuation. The details of his mission are given by the London *Times* as follows: "He will meet Sir Evelyn Baring, the British Consul-General, at Suez, and come to an agreement in regard to the coöperation of the English authorities in Egypt, as far as may be necessary. Mussa, chief of the Hadendowa tribe, whose sons General Gordon saved from death, to which they had been condemned by the Egyptian officials for having committed raids, will be summoned to Suakim, and General Gordon will go under his escort to Khartum, where he will assemble the heads of the tribes and announce that he has come on behalf of England to restore their liberty and remove the adventurers who have been the curse of the country. He will also inform the chiefs that the slave trade must cease. As soon as he has finished his task in the Sudan, he will go to the Congo country and deal with the slave trade at its headquarters. General Gordon expects to be five months in the Sudan." The mission of General Gordon meets with great approval in England, but there are some serious protests against the Liberal policy and the prospective loss of the Sudan.

It was reported on Saturday that negotiations had been opened between Egypt and Abyssinia. The latter demanded the cession by Egypt of the Bogos territory and the port of Massowah, which adjoin the northeastern boundary of Abyssinia, under a threat that the King of Abyssinia would declare war with Egypt if this demand was refused. Egypt is willing to cede the Bogos territory and the port of Zula, which is south of Massowah, on condition that Abyssinia shall operate against El Mahdi. This arrangement is regarded as probable.

Baker Pasha's negotiations with the tribal chiefs in the Sudan have been successful. The sheikhs who have visited the Egyptian camp represent 38,000 men who are willing to fight. A despatch from Khartum to the London *Times* on Tuesday said that no order for the evacuation of that place had yet been given.

A private telegram to the Austrian Consul at Khartum, on Thursday, reported that all the higher Egyptian officials at El Obeid had been massacred.

Herr Streker has arrived at Prague, bearing an autograph letter to the Cabinets of Berlin, Paris, and London from the King of Abyssinia. Sir Evelyn Baring, the British Commissioner in Egypt, requested Herr Streker to unfold his views with regard to an equitable basis of peace between Abyssinia and Egypt. It is expected that England will intrust Herr Streker with a mission to King John of Abyssinia.

An interview was published on Thursday in London with a leading member of the Chinese Embassy. He said that China had not yet declared war against France, although her memorandum to Prime Minister Ferry, in which China declared that an assault upon Sontay, Hunghoa, or Bacninh would be *casus belli*, would be carried out to the letter. The attaché most positively declared that the Chinese Government would never entertain a proposal to evacuate Bacninh as a basis of negotiations for the settlement of the Tonquin question.

A leading member of the French Embassy in London asserted that this interview gave substantially a correct account of the situation of affairs, except that he believed that the Chinese troops would be withdrawn from Bacninh. France did not intend to declare war against China, as she had not received any trustworthy information that the garrison at Sontay was composed of regular Chinese troops. He did not know what France would do if Chinese troops should oppose the French at Bacninh, but France was determined to take Bacninh at all costs.

From Parisian sources it was reported on Monday that M. Waddington, the French Ambassador to England, in a recent interview with Earl Granville, the British Minister of Foreign Affairs, declared that France would not recommence negotiations with China until all her objects in Tonquin had been achieved. M. Waddington, it is said, informed the French Government that Earl Granville approved the views of France in the matter.

It was reported in Paris on Tuesday that Admiral Courbet has been ordered not to attack Bacninh until he has received further orders from the home Government.

A decree of President Grevy was published in Paris on Saturday, providing for the reorganization of the French settlements on the Gold Coast of Africa, by placing them under the jurisdiction of the French Commander-in Chief at Gaboon.

Prince Victor Napoleon, in reply to an inquiry from M. Cassagnac as to how far the Bonapartists might count upon him, says that at present he has no political rôle to fill, and that he intends to hold himself in reserve until duty calls him to serve his country.

The Nihilist Prince Krapotkine has been transferred, on account of ill-health, from the prison at Clairvaux, where he has been incarcerated the past year, to the Infirmary in Paris.

The trade of Paris is more active than at any time during the past year, and the attempts of the workingmen to create an agitation are, it is said, made merely for political effect.

A championship billiard contest in Paris was concluded on Friday night, the score being Vignaux 3,000, Schaefer 2,868. It was played in five evenings.

The Spanish Ministry was defeated in the Chamber of Deputies on Thursday, Señor Sagasta's counter address in reply to the King's speech being adopted by a vote of 221 to 126. The Cabinet at once resigned. King Alfonso failed to effect an arrangement with the Liberals, and called upon Señor Canovas del Castillo, a Conservative, to form a Cabinet. This created a sensation. The Cabinet was gazetted on Friday, and there was general rejoicing that the crisis was over.

The Berlin *North German Gazette* (Bismarck's organ) has made a bitter attack on Señor Emilio Castelar, the Spanish Republican leader, who, it says, only prefers a republic because he fancies that that form of government would afford him opportunities to enrich himself.

The Centre party in the Lower House of the Prussian Diet intend to move the abrogation of the law stopping the salaries of Catholic clergymen, and a revision of the May laws. The Vatican and Prussia have settled the question in relation to the training of the clergy in seminaries, and the negotiations for the restoration of bishops to their former dioceses are proceeding.

A committee has been formed in Berlin, under the presidency of the President of the Reichstag, to superintend the funeral of the late Herr Lasker. It has been decided that the funeral ceremonies shall take place on Monday, January 28. They will be on a grand scale, and societies from all parts of Prussia will participate.

Prince Bismarck is now in better health than for many years.

Baron von Friedenthal, Austrian Minister of Commerce, has approved a scheme for a regular monthly line of steamers between Trieste and New York. The steamers will begin running on the 1st of February.

M. de Giers, the Russian Minister of Foreign Affairs, arrived in Vienna on Sunday morning. He was driven immediately to the Imperial Palace, where he was received by the Emperor of Austria, who gave a dinner in his honor. He left Vienna on Tuesday.

M. Boland, the Belgian journalist who was expelled from France some time ago for alleging that he had bribed certain members of the Chamber of Deputies, was sentenced to three years' imprisonment and a fine of $400 at Liége, Belgium, on Thursday, for obtaining money on false pretences to establish a bank.

The Court of Queen's Bench, London, on Tuesday rendered a judgment in favor of the Bishop of Manchester. The latter had refused to induct a Ritualist clergyman into the living at Miles Platting, and the suit was brought to compel the Bishop to do so.

A riot broke out at Enniskillen, County Fermanagh, Ireland, on Saturday. A body of police charged the mob, and was assailed by the Nationalists with a volley of stones. The Orangemen also stoned the police and afterward stoned the Catholic schools.

A summons has been issued against the Park Club of London for permitting the game of baccarat to be played in its rooms, with high stakes. The club maintain that the prosecution is illegal. The affair has caused a decided sensation in the principal London clubs, which will be affected by the decision of the case.

Monsignor Cesare, a dignitary of the Romish Church, was murdered in Rome on Thursday night, and his room plundered. His man servant was seen to issue from the room with bloody hands, and has been arrested.

The second session of the fifth Parliament of the Dominion of Canada was opened in Ottawa on Thursday. Sir John A. Macdonald met the House with a following of 140 supporters, and the Opposition benches contained 79. Few important measures will be considered during the session, among them a bill for the more equitable distribution of insolvent estates, and a bill extending the franchise to young men and unmarried women and widows who have a qualification of $400 a year.

The last stronghold of the revolution in Hayti is broken. Miragoane surrendered to the Government on January 10.

THE PREVENTION OF ELECTORAL MUDDLES.

THE Senate has again passed the bill to regulate the counting of the electoral vote, and it has been done at this time in order that it may be brought up and debated in the House early in the session, and thus have a chance of passing. The bill introduces two changes of importance into the existing law regulating the subject. In the first place it changes the *time* for the voting of the Presidential electors from the first Wednesday in December (U.S.R.S., sec.135) to the second Monday in January following the election. The object of this is to give as much time as possible after an exciting campaign (like the Tilden-Hayes contest of 1876-77 for instance), for passions to cool, for the exact facts of the vote in every State to be ascertained, and (as we shall presently see) for the State itself to provide a solution for any question that may have arisen. It may be objected to this that in 1877, the rage and fury of the contest was at its height in January, so that the time allowed by the bill would not have been enough. But, in the first place, what we have got to provide against is not a precise repetition of the Tilden-Hayes contest. The fierceness of that came from the fact that it pitted South against North, Rebel, or ex Rebel, against Union man, and, worse than all, white against black—rearoused the passions of the war, then just dying out, and now fortunately quite dead, so far as practical politics are concerned. Such a contest will not trouble us again during our lifetime; nor need its recurrence be provided against. What is far more likely in the future is a contest turning upon the vote of a doubtful Northern State, like New York, for instance, and a "muddle" arising simply out of some charge of fraud, to sift which would require a little time and patience, and possibly a summary decision of the title of the Presidential electors of the State by local machinery. Six or eight weeks seems long enough for this. Moreover, a limit to any very much greater extension is imposed by the fact that the new President must come in on March 4, and any questions arising out of the election ought to be settled as early as possible before that date; for while there must be time to get at and decide the facts, the longer the struggle is kept up the greater the temptation to factious, tricky, and unprincipled men to keep it undecided beyond the 4th, for the sake of getting from a disputed succession what they cannot hope a fair decision of the questions involved will bring them.

The next change in the law is a provision to enable each State to provide machinery for the settlement of any dispute concerning its Electors. Each State may, pursuant to its law existing on the day fixed for the appointment of the Electors, determine any controversy concerning their appointment, or that of any of them. This determination must be made at least six days prior to the meeting of the Electors, and is to be conclusive evidence of the lawful title of the Electors, and shall govern in the counting of the electoral votes. With this provision certainly no fault ought to be found by Democrats, for it is in accordance with the most conservative States-rights view of the Electoral College. The question may be raised whether it is necessary for Congress to pass such an enabling act, on the ground that the States have the power already; but in that case the law can do no harm to them, while the pledge given in it that the State determination shall be *conclusive*, is a valuable guarantee that, when the matter is once determined in this way, the question will not be reopened at Washington. How far the States will take advantage of this provision remains to be seen after Congress has passed the act.

On the second Wednesday in February the two houses are to meet to count the vote, with the President of the Senate in the chair. The language of the Constitution (XIIth Amendment) is merely "the votes shall then be counted." On the counting, any objections are to be made in writing, and when they have all been received the two houses are to separate and act upon them each in its own chamber. No State which sends a single return can be thrown out except by an affirmative vote of both houses. If more than one return is sent in, the determination by the State tribunal is to govern. In case, however, of a question as to which of two or more State tribunals has the right of determination, a concurrent vote by both houses is required to settle the question. The same concurrent vote is required in case there has been no determination by the State.

Comparing the act with the Electoral Commission Act of 1877, we see at once that what is proposed is, to enable each State to provide its own machinery for deciding summarily the disputes which, under that act, were sent to a commission called into existence for the purpose. Then, as now, no electoral vote was to be rejected from a State sending in only one (Elec. Com. Act, sec. 1). Then, as now, double returns were to be decided by a tribunal. In 1877, however, nothing but a United States tribunal was possible. Discussion among the best lawyers of the Senate since has convinced them, as we presume it has convinced most other people, that if the States choose Electors, it is the States which ought to be left to decide what Electors they have chosen, and that the function of "counting" votes ought not to be pushed to the point of making Congress a Returning Board. It may be said that the proposed act still leaves open the possibility of a dispute between the two houses on returns where the State has determined nothing; but in such a case it would be clearly the fault of the State, and no act can guarantee us absolutely against all chance of trouble.

CONGRESSIONAL PLEASANTRY.

THE correspondents at Washington seem to have been amusing themselves by extracting explanations from Mr. West about Mr. Hewitt's reported apology for his O'Donnell resolution. Mr. West has submitted to the interviewing process apparently with too good a grace, for they are now ridiculing him for being so easy of access and having so much to say. The Washington correspondent of the *Herald* has taken the trouble to fish out Mr. West's despatches of two years ago to his own Government, in which he expresses more or less concern over the dreadful language of Mr. Robinson of New York about the British Government, and over a resolution of inquiry as to the number of American citizens held in custody in England and Ireland, introduced in the House by Mr. Orth. There is certainly something funny in Mr. West's grave treatment of these matters; but it is on the whole creditable to Mr. West, and rather complimentary to our Government, that he should not have seen it. The late Lord Lytton once told Mr. Matthew Arnold that he had attained the highest measure of success for a literary man in "being taken seriously by the judicious." It ought to be for legislators and politicians a sign of excellence also to be taken seriously by sensible men—that is, to have it supposed that they mean what they say, and do not talk for the sake of making a noise or misleading people who listen to them.

But anybody who takes our House of Representatives seriously on the strength of what he knows of European legislatures, is likely very often to make amusing mistakes, for two reasons which do not present themselves at first blush. One is that there is no European representative body, except the German Reichstag, which has so little power over the Executive branch of the Government, and, therefore, feels so little responsibility for what it says. The House of Commons, or the French Assembly, or the Italian Parliament, can drive a Ministry out of office by a hostile resolution, and, therefore, the Ministry carefully watches its temper, and does not venture wholly to disregard its measured utterances. For the same reason the House itself, knowing what serious consequences its utterances may have, takes care that they are measured, and that they are not wasted on trifles or used for simple bunkum. Under this head may be included the fact that in a community of states like Europe, in which each nation has immense hosts all ready for war, and often watching for an excuse for war, political men soon acquire the habit of weighing their words, and of taking care that nothing shall drop from them at which foreigners may take offence when no offence is meant. The masters of thirty legions, in short, have to be touchy and punctilious, just as the men who carry revolvers are here, for the legions will not serve the thick-skinned or the meek. Our Representatives occupy no such position. The Executive is not responsible to Congress, is not made and cannot be unmade by it, and can have no serious duties or responsibilities put upon it by any Congressman's speech, or by any vote or resolution of the Lower House. Moreover, the United States have no dangerous or sensitive neighbors, all armed and equipped for war. No foreign Power, however touchy, can take offence at anything said here inside a fortnight—for offence by cable, we believe, does not count, and there is very little anger nowadays in the world which language two weeks old can kindle.

The second reason is one which Europeans find it more difficult to understand, and that is, the large part that talk plays in American politics. There is an old English proverb that "fine words butter no parsnips." In American public life, they do butter parsnips, and very liberally. The large

number of deliberative bodies which meet all over the country every year, in the shape of conventions and caucuses, have created a custom of satisfying both public and private claims by means of phrases, which is unknown in the Old World. The nominating conventions draw up platforms which are simply either a string of propositions that no decent man would deny, or of promises which nobody expects the party to keep, and yet the public looks for them and enjoys reading them, and no party would venture to discard them. The "complimentary vote," too, for the man who is not to be elected, and the "unanimous resolution," which is really carried by a small majority, are all parts of what may be called an elaborate system of political etiquette, in which empty phrases are used, as they are in social etiquette in France and Spain, simply to make people feel comfortable, soothe ruffled susceptibilities or disappointed hopes, and make the machinery of politics work smoothly. Americans understand it all perfectly, and are not a whit surprised when they see the habit of saying both dreadful and nice things which are not seriously meant, carried into the halls of Congress, but are nearly as much surprised when foreigners take them in earnest as a Spaniard would be if you proceeded to take possession of his house under the polite formula in which he places it wholly at your disposal.

That Mr. West should think it worth while to write home about Robinson's resolutions, or about Mr. Hewitt's demand for a stay of execution in O'Donnell's case, is therefore not greatly to be wondered at. He has really been hardly long enough in the country to get what is called "the hang of the thing." Americans know that when Robinson or any one else is hurling defiance at kings and emperors, he is either assuring some portion of his constituency that he is alive and kicking, or is simply expressing general dissatisfaction with the condition of the bulk of the human race.

THE STABILITY OF THE PRESENT MEXICAN GOVERNMENT.

The reciprocity treaty with Mexico, which is now before the Senate in secret session, is, as far as can be judged from what leaks out about the debates upon it, in a considerable degree dependent for its confirmation on the ability of its promoters to show that the prospects of the existing régime in Mexico are good; or, in other words, that the Government with which we are treating is likely to last, and the country likely to prosper under it.

Mexico is entering upon her eighth year of unbroken peace. This is an experience which she has not so much as approached since 1810. The wars of the Independence were no sooner ended than the fierce internecine strife of domestic factions was precipitated, which, in its turn, was calmed for a time before the French intervention, only to break out again in fresh fury when once the hated foreigner was disposed of. But since the brilliant *coup* in 1876 of that most romantic figure in Mexican history, General Diaz, the sound of the pronunciamiento has been no more heard in the land; no "plan" or "cry" of any importance has been put forth. What is the cause of this new era of quiet? Before giving what we conceive to be the true answer, we will notice one or two of the explanations which are current in the newspaper press, and which have appeared in recent articles and books on Mexico.

It is frequently said that the Mexicans have become tired of revolutions, that they have learned the lesson of the disasters of their country, and have now made up their minds to devote their energies to the development of their natural resources. This is little more than a restatement of the fact whose explanation is sought. One would think that thirty or fifty years of anarchy would have sufficed to "tire" the Mexicans of political chaos, yet the conflicts of 1876 seemed to be waged with as much enthusiasm as those of 1826. Why the sudden flagging of ardor since? We are told that the new railroads, stretching out over the entire country, have wonderfully strengthened the Government by enabling it quickly to mass troops at any desired point, and so to quell any uprising before it becomes formidable. But there does not appear any good reason why disaffected generals could not utilize the new means of transportation, for the purpose of speedily rallying their adherents, in such a manner that the Government would have little advantage over that of the days when soldiers moved only on foot. And suppose the Government troops should join forces with the rebels, as often used to be the case; the railroads would only accelerate their attack on the capital. Suppose General Treviño, of the Department of the North, were to "pronounce," what effect could the northern divisions of the Central and National Railways have, except in his favor? We must go deeper, and learn why there is so little disaffection; why all the prominent military leaders are content to support the Government, and are not continually, as was their wont, raising the standard of revolt. It is urged that this unprecedented period of peace is due to the great personal influence of Diaz, who has made himself master of his country, and causes peace because he wills it, by his irresistible power, either winning the admiration or crushing the antagonism of any who might be his rivals. This is nearer the real solution, though it is incomplete without an explanation of the means which Diaz has used to create and maintain his power. If he has been more successful than Santa Anna or Juarez, it can only be due to a better command of the situation, not to superior personal prestige. It would seem, then, that we ought to look to the external circumstances of the Government more than to its mere *personnel* to find the cause of its stability. To come at once to the point, it is our opinion that it is almost wholly a matter of revenue. The vital question of Mexican politics has always been the financial question. The lack of stability, so conspicuous in the administrations of other days, was due to a lack of the funds necessary to carry on the Government. The unprecedented peacefulness of the past eight years is due to the unprecedented revenues of the past eight years.

One of the most acute though little known writers on Mexico is a French Abbé, Emmanuel Domenech, who was chaplain of the French army in Mexico and held the position of Director of the Press in Maximilian's cabinet. He published 'Le Mexique tel qu'il est' in 1867, and a 'Histoire du Mexique' in 1868, both of which works, though highly valuable, are out of print. He makes it very clear that the want of money had been the great determining reason of the fall of Government after Government, up to the time of his writing. When independence was finally achieved there was a perfect rush of the upper classes of the country for a share of those revenues which were no longer to flow into the treasury of Spain. There was speedily developed a rage for office-holding (*bureaumanie*). Scores of applicants elbowed each other for every vacancy. The disappointed candidates went away ripe for rebellion. So with the army, officers and men. When poorly paid, or not paid at all, they swiftly passed from grumbling into open revolution. All that any general had to do was to promise his troops better wages, and they would follow him anywhere, on any errand. "The Mexican soldier, forcibly torn from his house, his family, his pursuits, had no more reason for fighting for one party than the other; he would desert as soon as he was not paid. Well paid, well fed, and well clothed, Mexicans will fight faithfully for those who pay them, whoever they may be." "It is evident from the history of the rise and fall of every Mexican Government, that the cause of the rise, as of the fall, was solely the lack of money. As soon as the executive power could no longer give security to the great proprietors, nor furnish lucrative situations to the ambitious, or money to the generals to pay the troops, revolution would burst out, and the Government would fall. 'The good of the country,' 'liberty,' 'the rights of the people,' were the pretext, but private interest was always the real cause of the revolution." These opinions of the Abbé he supports by an array of facts which make his position unassailable. He shows how Juarez had but a meagre following until he made himself master of the Vera Cruz Custom-house, and confiscated the property of the Church, when partisans thronged to his support. He makes it incontestable that the fall even of Maximilian, after the departure of the French troops, was largely caused by the impossibility of providing for the financial needs of the empire.

Now, if we can show that the converse also bears out the theory—that the modern period of a firmly established Government is likewise the period of increased and sufficient income, that troops and office-seekers are contented because they are well provided for—it will be good proof of the view we have advanced. To do this needs only a glance at the official statistics. At the celebrated conference of Maximilian and his ministers at Orizaba in 1867, when he made the decision to remain and try to establish the empire, the flattering hope of a revenue of $11,000,000 was held out before him. The income at present is $32,000,000. The remarkable thing about this advance is that it has gone on in great leaps, principally since 1876, when Diaz came to power. Here is where large

credit is due him for statesmanship. He clearly saw that it was not so much a question of persons or of the form of government as of an assured and adequate income, without the necessity of resorting to forced loans. Accordingly he set himself resolutely to the task of reviving a strangled commerce, of making unused resources available. He sought the alliance of American capital. In the face of an intense opposition, he pushed through the charters and subsidies of the new railways. He encouraged and facilitated all kinds of investment and enterprise. Agriculture, mining, manufacture, awoke to new life. The public revenues enlarged. There was enough to pay the troops. Numberless new places were created for clamorous applicants: inspectors, contractors, agents, swarmed along the lines of the railroads. The demand for 50,000 laborers, at what were thought fabulous wages, greatly eased popular discontent, and gave employment to disbanded soldiers and guerrillas whose occupation was gone. Every new project of canal or harbor gave a comfortable place to a half-dozen engineers, who assiduously designed, advised, inspected, and drew their salaries. The new plan has, thus far, been completely successful. Money, employment, content, all have abounded. In 1881 there was a surplus revenue of $800,000. What would Maximilian or Juarez have said to that?

Yet the heavens are far from being unclouded. It is evident that the Government is under a great strain. Expenses are more than keeping pace with income at present. The subsidies of the railroads are a terrible drain. The outlay on army and navy consumes one-third of the entire revenue. Curtailment seems impossible. The question is whether increasing income will enable the administration to meet the pressure. That is the hope of Mexican financiers. But there are symptoms of coming failure. The Government has been forcing into circulation a vast sum of depreciated and unpopular coin. Hence the late "nickel riots." The telegraph reports the negotiation of a loan of $5,000,000. The Opposition papers are making ominous prophecies. It is all a matter of book-keeping. With the balance on the right side, all will be well. On the wrong side—well, General Diaz says it must not be on the wrong side.

THE GLADSTONE MINISTRY AND THE SUDAN.

THE London press and London society have begun to prophesy all sorts of dreadful things as likely to result to the Gladstone Ministry if anything serious should now happen in the Sudan, in consequence of their failure to make preparations to defend it. Should Khartum fall, they say, or another Egyptian garrison be massacred, the English people will rise in their might and hurl Gladstone from power. The provincial newspapers take no such view, however, and, as the memorable election of 1880 shows, they are far more likely to be right than the metropolitan critics. The Jingo fever never took hold of the bulk of the Liberal voters, and is never likely to do so. They have repudiated absolutely the Beaconsfield doctrine that England is bound to put itself in the way of responsibilities abroad, on what Lord Salisbury called the "Elizabethan plan." The Liberal doctrine is, that she is bound not to shirk responsibilities which are plainly forced upon her, but she is not to reach out for them. The occupation of Egypt was accepted by the party in England because, given the need of maintaining the Indian Empire, it seemed to be a necessity. For the same reason that the occupation was delayed as long as possible, it was made as little of an occupation as possible. The Government of the Khedive was not interfered with any more than was needed to restore and maintain order. Everything was done on the assumption that if he got a fair chance he could set up and carry on a stable government, and that it was desirable that Egypt should be administered as far as possible by native officials.

The experiment has been fairly tried, and has, as many good Liberals foresaw, broken down. Both the Khedive and his officers have proved unequal to the task imposed on them. The Constitution drawn up after the expulsion of Arabi has come to nothing, as Lord Dufferin anticipated, because the Egyptian people are not fit to work any constitution. They have not reached the deliberating or discussing stage in government at all, and know nothing of any government which does not consist in commands sanctioned by corporal punishment. In the meantime the finances have continued to be unequal to the strain put upon them by the enormous debt. The country shows itself still less able to meet the public burdens than under the late Khedive. There is a heavy deficit every year, and no money whatever for the protection of distant dependencies like the Sudan. The Tory critics of the Ministry insist that they should have foreseen all this from the outset—that is, have assumed after Tel-el-Kebir that the Khedive would be unable to govern the country, and have taken the Government, finances and all, wholly into English hands, or, in other words, have annexed Egypt. But this is the very kind of assumption that the Liberals dislike. They hold that to justify the occupation of Egypt the need of it should be demonstrated by events, not guessed at by Cabinet ministers or military commanders. Of course it would be well to have foresight enough to be able to solve such problems at the very start, without experimentation. But the Beaconsfield performances in Afghanistan and South Africa did not recommend this off-hand process. Lord Salisbury and Lord Lytton and Sir Bartle Frere tried it, and failed miserably, and their successors naturally fight shy of it.

The breakdown of the Egyptian administration in the Sudan is the natural consequence or accompaniment of its breakdown nearer home. Like the breakdown of the Tory attempt to put Yakub Khan on the Afghan throne, it has been attended with some lamentable consequences, such as the massacre of Hicks Pasha's force. It is now said by the Opposition, in fact, that Gladstone is responsible for Hicks Pasha's fate, because he advised the Khedive to give up the Sudan. But then he did not advise Hicks Pasha to try to reach El Obeid across the desert. On the contrary, the British military authorities at Cairo tried to dissuade him from doing so. It is his disregard of their advice which has made the False Prophet such a great man. He had already been beaten back from Khartum, and was much demoralized, and would, if let alone at El Obeid, probably have seen his forces dwindle. The success which the Hicks defeat almost forced upon him has now made him formidable to anybody who wants to keep the Sudan. It has accordingly become the fashion to goad Gladstone by exalting the Prophet's horn, just as during the Beaconsfield administration it used to be the fashion to goad Gladstone by exalting the Russian horn. The more terrible Russia appeared, the worse man Gladstone was made to appear in not being alarmed by her. In like manner the more terrible El Mahdi can be made to appear, the more reckless and careless Gladstone can be shown to be because he underrated the Mahdi.

"Chinese" Gordon, who is without doubt incomparably the best man for the crisis, has now been sent to the front, not to save the whole Sudan for Egypt, but to save all of it that Egypt in her present condition can possibly afford to keep, or can govern. This must be the programme unless England determines to reconquer the Sudan herself with British or Indian troops; but there is no sign whatever that English Liberal opinion would sanction any such enterprise after the experiences of 1879–80.

COOKS.

THERE is said to be a good deal of trouble in the domestic-service market, owing to the dearth of cooks of the class that most people in moderate circumstances want. We have heard recently of an intelligence-office which finds such difficulty in supplying the demand for cooks that it has offered a bonus for any one who will bring it in one; and we believe the case is not a solitary instance. Of course, there are in New York a great many cooks. Those who keep a *chef*, on the salary of a United States judge or district attorney, have comparatively little difficulty, but, although we continually hear of the rise in the scale of living, for most of us it has not risen to that point at which we can keep a *chef*. The moment, however, that we go below the *chef* level, the process of getting a plain cook in New York is surrounded with extreme difficulties. This is not because our standard is extraordinarily high. By a good plain cook we mean a cook who knows how to cook the ordinary dishes eaten by the mass of those who live in "side" streets, in plain twenty or twenty-five-foot high-stoop or English-basement houses, or apartments—not the millionaire nor the tenement-house population, but the prosperous, well-to-do New Yorker. Almost all this class has been brought up in the same way on plain Anglo-Saxon cooking—involving mainly a capacity to produce a clear soup, to roast, broil, boil, or stew the ordinary kinds of butchers' meats, to make, not sauces, but gravy, to produce those simple messes known as puddings, and to prepare vegetables for the table so that they can be eaten. Now we do not exaggerate when we say that it is almost impossible to get this kind of

cook in New York for love or money. The cook that you do get when you go in search of a plain cook, does not appear to be able to do a single one of these things, and often seems ignorant of the very nature of the articles which she undertakes to get ready for the table. What is her idea of soup? A thick substance which suggests a stew of the day before, out of which the meat has been taken, and has then been treated with lukewarm water and grease in equal quantities. What does she do with beef? Our belief is that after being detected, as she not unfrequently is, in an attempt to pass off fried steak upon the household, she resorts to the convenience which the oven affords and serves beef baked. As to vegetables—to say nothing of potatoes, in the course of boiling which she always manages to introduce the water into the vegetable, and so produces the almost universal "soggy" result we know so well—spinach, a vegetable she is particularly fond of cooking, perhaps on account of its rich, green color, she generally sends on in the condition in which it would have disgusted Nebuchadnezzar. When it comes to such a dish as an omelet, we do not like to think, much less to write, of what she does.

The only explanation of such a state of things seems to be that the persons who introduce themselves into our kitchens under pretence of being cooks, are nothing of the kind. They are not cooks and never have been, but they have heard that in America there is a great demand for cooks, and that high wages are paid for them, and they therefore call themselves cooks. They are impostors, and in their hearts must have a great contempt for us in not seeing through the imposture long ago. Look at their advertisements. We have one or two before us, of a kind that appear in the newspapers every day, and that reveal at once the general view of the business taken by them. The first contains, after the address, these words—how often have we read them!—"Young woman as cook, or to do general housework." A few lines further down we find another advertiser offering in the same way, "English woman as cook or to do general housework in a small family." The idea which underlies these advertisements evidently is that the same person goes about from house to house, taking her turn at the range in one and doing the general housework in another, as the family likes best. She will do either one or the other equally well. When we remember how vast is the improbability of any such system of rotation in service being possible; how few cases we have ever known in which a woman who had really learnt to be a cook desired to alternate between that function and the other; and how few chambermaids we have met who were also competent cooks, we see that the idea involved is that any strong, healthy woman, who can make up beds, dust furniture, wash windows, and sweep floors, can also cook—or, in other words, that cooking is something for which no training is needed, and nothing is required but the food and a fire. If we look a little further down the column we find advertisers who go a step beyond, and jocularly add to their notices such expressions as "Two years' references. *No cards*," or "Call Saturday. *No cards*"—phrases which strongly suggest the roars of laughter which must shake the sides of the stalwart girls when, after composing these contributions to the Want columns, they read them aloud to a merry little circle of other "cooks."

This state of things has at last brought us face to face with the question, Is there no substitute for cooks? It has always been taken for granted in English and American literature that, in the words of a poet who has devoted a good deal of time and reflection to the subject,

"Civilized man cannot live without cooks."

But what Owen Meredith meant was civilized cooks, or cooks who knew how to cook—not the race of savages who have in our time assumed the honored name, and masquerade as cooks because they are convinced by what they have learned about us that we do not know the difference. The rise and growth of a system of catering which shall enable the householder to get a dinner without having to employ a cook, may be already detected as among the things which give promise of a brighter future for New York and all other large American cities. This city really presents a field such as no other great modern city affords for an enterprising caterer. Not much capital is required. Two or three central kitchens, a few carts and fast horses—and the United States is the home of fast horses—with these any good restaurateur could supply meals to families by the hundreds at a much cheaper rate than any family gets them at now. The great development of apartment life here furnishes a strong reason for immediate success. Families living in apartments are just those who find most trouble in getting cooks. Cooks, it is well known, prefer houses, partly because, owing to the greater accessibility of a kitchen in an apartment, they are sooner found out than in establishments where they are in a quarter of their own; and most people who live in apartments do so in a measure for the sake of economy, while what cooks like is waste.

Of course, it will be said that there is the great difficulty of serving a dinner sent round in a cart—dinners *à la cart* they should, we suppose, be called—really hot; but leaving aside the question how often, as it is, people get their ordinary domestic dinner hot, this problem has, we believe, been solved by the use of steam, by one pioneer concern, which is now engaged in a praiseworthy attempt to reduce the number of cooks in New York. How far this or any other such scheme will succeed, must depend of course on the character of the meals and the punctuality of the service; but it will be indeed surprising if in this home of invention, in this land in which so much time and thought is spent on the invention of labor-saving machinery, we should much longer be obliged absolutely to depend upon such a crude, and primitive, and wasteful appliance as our domestic kitchen, with its savage and untaught administrator. We like not infrequently to think of New York as it might be rather than as it is—as filled with countless happy homes and flats, where the approach of the dinner hour no longer calls up dreadful anticipations of mistake and disaster, but of pleasure and content; where, punctual on the stroke of the hour, the fast team of the provider rattles up to the door—the breed of horses developed by the Fire Department might, we should think, be used for this purpose—bringing with it that great desideratum of our life, a dinner involving in the background neither kitchen nor cook.

THE LAST DAYS OF LOUIS XVII.

PARIS, December 21.

THERE is such a love of the marvellous in the human mind, that there are many people who still believe that the unfortunate son of Louis XVI. and of Marie Antoinette did not die in the Temple. There have been several false Louis Seventeenths. I have known one personally—a handsome old man, with the Bourbon nose, who did not look like an impostor; he was good, kindly, and mad. He used occasionally to come and take his dinner at a very modest table d'hôte in the Rue Jacob, where I went as a student. At present there is no Louis XVII., but there are some pretended heirs of the Dauphin. Five of them bear the name of Naundorff, and live in Germany; some have taken service in the German army, and I have been informed that they have friends who try to make proselytes in their favor, especially in the ranks of the lower clergy in France.

No serious person in France believes now in the claims of any "false Demetrius." Still, some interest must always attach to the documents which concern the young Prince who was the victim of the Convention. M. de Beauchesne has written a touching book on the Dauphin, which has had several editions. M. de Chantelauze, the son of the Minister of Charles X., who is a very laborious historian, and who has given us very interesting works on Mary Stuart, on Cardinal de Retz, on Cardinal Mazarin and his nieces, has been fortunate enough to discover new and very conclusive documents on the young Prince. Hitherto the historians of Louis XVII. have only known of two inquests made by order of Louis XVIII., after the Restoration. One had for its object the discovery of the remains of the young Prince in the Cemetery of Saint Margaret; the other, the authentication of the heart of Louis XVII., which the surgeon Pelletan had kept for himself when he made the autopsy. There was another and a much more important inquest made, which was kept secret, the King having confided the care of it to his favorite, the Count Decazes, who afterward became the Duke Decazes. The King charged the Count Decazes, who was at the time Minister of Police, to find out all the people who had shown marks of kindness to his unfortunate nephew, and to acknowledge their perilous devotion. M. Decazes was so fortunate as to find several guards and employees of the Temple, and, among others, the civil commissioner who had witnessed the death, the autopsy, and the funeral of the Prince.

After the Revolution of 1830, all the papers and documents collected in this inquest were placed in the Archives, where they were forgotten till M. de Chantelauze brought them again to light. Among the employees of the Temple was the Prince's servant, Caron, who still lived in 1817. Caron declared, on the inquest, that he brought his meals three times a day to the young prisoner, and had taken him a *bouillon* half an hour before his death. One of the last keepers of Louis XVII., Gomin by name, was found in 1817 in Paris, and soon afterward the police found the very last, Lasne, who had been a

commandant of the National Guard in the section of the "Rights of Men." Lasne was a house-painter; the agents of Decazes represent him as a very honest and good man. Two municipal officers, who had rendered small services to the Prince, were also found, and Louis XVIII. made one of them a Knight of the Legion of Honor. The inquest furnished very interesting details about the doctors who had seen the Prince. The most important discovery was that of the widow of the famous Simon, who was found in the Hospital of the Incurables, in the Rue de Sèvres. There is a feeling of universal reprobation attached to the names of the shoemaker, Simon, and his wife, who were the keepers of the young Prince. The agents of Decazes seemed to believe, however, that the wife of Simon, far from having tortured the child confided to her charge, took care of him as a mother. "And what," says M. de Chantelauze, "at first sight seems no less extraordinary, is the fact that the Sisters of the Incurables were of the same opinion as the agents of the police. During the twenty years which the widow Simon spent in this hospital, where she died on the 10th of June, 1819, she was placed under the direction of Sister Sainte-Lucie, who learned from her many particulars, true or false, concerning the Temple." Sister Lucie was still living in 1830, and one of her friends, Sister Nicolas, who even now survives, at Clichy, has given notes to M. de Chantelauze, in which it is said that "the widow Simon was naturally good and mild. She professed to have only ill-treated the little Prince during the visits of the municipality. These visits over, she and her husband treated the child with mildness."

It would not be surprising if Simon and his wife were less ferocious than the Commissioners of the Paris Commune, who from time to time came to see their victim. But if we may believe that they did not make the young Prince suffer constantly in a material sense, it is too well proved that in a moral sense they tried to debase him, that they did all they could to efface in him every trace, every memory of his royal origin. Simon was a *sans-culotte*, and his ambition was to make a *sans-culotte* of his prisoner. He had great claims on the gratitude of the Commune and of the Convention. After the death of Louis XVI., all the Courts of Europe had recognized young Louis XVII. as the King of France; Marie Antoinette treated him at once, though they were both in prison, as a king. Numerous conspiracies were formed in order to free the prisoners of the Temple. The Convention was alarmed. The death of Marie Antoinette was resolved on, but she was first separated from her son. M. de Chantelauze says that the most dangerous conspiracy made for the rescue of Louis XVII. was that of Michonis, which was discovered by Simon. Michonis was one of the guards placed by the municipality of Paris at the Temple; he and four others, moved by the spectacle of the misfortunes of the royal family, planned their escape. Simon, who was also a municipal guardian, discovered and denounced the plot. Michonis and another died on the scaffold. In order to recompense Simon, the Convention gave him the whole charge of the education of the Prince. At the same time, he was to act as a spy near the Queen and Mme. Elizabeth. He was charged to collect all possible information, even from the mouth of Louis XVII., for the trial of the Princesses. By the most atrocious coercive measures, Simon forced the young Prince to become one of the accusers of his mother and of his aunt, and to become an unconscious instrument of their fate.

A fact on which M. de Chantelauze much insists is this: Simon was determined to ruin the Queen. To send her to the scaffold was a mission of which he seemed to have been proud. He tormented and brutalized the child as long as he could hope to get a word from him which could be used against Marie Antoinette. After her execution the brute seems to have become milder; Simon made himself a companion of the innocent child, and played with him in his prison. While the Queen was still alive, Simon cut the beautiful locks of Louis, took off the mourning dresses, and gave him the costume of the *sans-culottes*, with the red Phrygian cap. He forced him to wash his room and to clean it. He taught him obscene songs, he refused to give him his food if he did not sing the "Marseillaise." The poor child had a truly noble heart. One day, after Simon had beaten him, he asked: "Capet, if the Vendéens delivered you, what would you do?" "I would pardon you." Chaumette, the procureur of the Commune, sent playthings to the child, and, among others, he put in a small guillotine. It is doubtful if the followers of the King of Dahomey can have more horrible inventions. Simon, for his ignoble work, received from the Commune a salary of 6,000 livres; his wife had 4,000 livres. The two sums together would represent now about 40,000 francs. They spent all this money in fine repasts and in drink. They tried constantly to make the child get drunk with them. Simon had reduced him to a state of abject terror, and thus turned him into an accuser of his mother. Hébert, the Communist, invented the accusation; he taught Simon a lesson; Simon taught it to the child, who did not even understand it. It is impossible even for stern history to reproduce textually the imaginary accusations made against Marie Antoinette; history only remembers her sublime protest: "J'en appelle à toutes les mères!"

The Convention was satisfied when the daughter of Maria Theresa ascended the scaffold. The work of Simon was done; he resigned his office of governor of the son of Capet. The Convention judged that it was not necessary to replace him, as it was decided that the guardianship of the young Louis should be confided to the men of the Commune. This measure was disastrous, in one sense. Thus far the young Prince had been regarded as a state prisoner; the men of the Commune simply looked upon him as an ordinary prisoner. He was subjected to the regimen of thieves and assassins. He was deprived of a single servant. At the age of eight he was thrown into a noisome cell, all alone, and his cell was not cleaned sometimes for days. He lived thus six months more, but he was fortunately seized with a skin disease, and finally died. Death was to him a deliverance. Hardly anything was known about his last end, till M. Decazes found the Civil Commissioner Damont, who had been called to the Temple the day of the death of Louis XVII. He spent three days in the Temple, and wrote a detailed report, the original of which is now in the national archives. Damont recognized the child, though he was much altered. The last words of the Prince were these: "Put me in a place where I shall not suffer so much." It had at first been decided to keep his death secret. Four deputies, however, went to the Temple the next day to verify the identity. Damont saw the autopsy. He kept for himself some hair of the young Prince, which he placed in a morocco box. The report will be found *in extenso* in the appendix to the interesting work of M. de Chantelauze. It is followed by a "Procès-verbal of the autopsy of the son of Louis Capet, made in the tower of the Temple on the 21st Prairial, year III.," signed by two doctors, Dumangin and Pelletan. The doctors note two tumors, one on a knee, the other on an arm; they make, also, a number of medical observations, and conclude thus: "All the disorders of which we have just given the details are evidently the effect of a scrofulous vice which had existed for a long time, and to which ought to be attributed the death of the child."

M. de Chantelauze has collected many portraits of Louis XVII. He gives us in his work only the charming portrait of the child as a Dauphin, with the cross of the Holy Spirit and the *cordon bleu*. The eyes are beautiful, and the features are extremely noble and elegant.

Correspondence.

PACIFIC-COAST VIEW OF THE CHINESE.

TO THE EDITOR OF THE NATION:

SIR: May a constant reader of the *Nation*, an admirer of its wit, wisdom, and critical acumen, taking the following sentences clipped from recent editorials, as a reason for inquiry, ask why you so persistently misrepresent American, and especially Pacific-coast, public opinion as to the Chinese question?

"We have actually undertaken to exclude from the United States the inhabitants of a great empire for no better reason than that they worked for too small wages, and that their standard of living was low" (*Nation*, Dec. 20, 1883).

"The mere irritation, in fact, caused to certain classes of our people by the spectacle of Chinese frugality, industry, and cleanliness is of itself a reason for their detestation of Chinamen" (*Nation*, Nov. 15).

Now, on the Pacific coast, those of us—to whichever one of these "certain classes" we may belong—who desire to see this magnificent empire something other than an abiding-place for a population of paupers, coolies, and millionaires, who, in fact, wish that it may develop into a great state, in all that the words imply, believe that the *Nation*, in discussing this Chinese question, so vital to us, is in some respects wrong. For instance, we had supposed, until you came to enlighten us, that not all "the inhabitants of a great empire," but only a certain class of its inhabitants, were excluded from the United States by the anti-Chinese legislation; that the rate of Chinese wages, the standard of Chinese living, while cutting some slight figure in the discussion of the question, were by no means the determining reasons for the passage of the Anti-Chinese Bill. On full consideration of the whole matter it had seemed to some of us heretofore that not one single solid argument could be advanced in favor of Chinese immigration, and that in any true sense the Chinaman is neither industrious nor frugal, as not the most hide-bound pro-Chinese fanatic would for a moment contend that he is (save, in some cases, as to his individual person) cleanly. Industry, in any proper sense, implies much more than working twelve or fourteen hours each day like an animal, then, after stupefying one's self with opium, going to sleep in a veritable sty or stall. Frugality means more than the division of air, food, drink, and women, so that those expenditures which enable men to refine themselves, to make human life decent, may be kept at the lowest figure, at the sacrifice of everything that to an American or European makes life worth having.

But the bestialities of the Chinese might be passed over did there seem to be any possibility of correcting them by allowing their perpetrators to stay here, to cast in their lot with us, to become, all unfit as they are, citizens of the State, as other immigrants become its citizens. But as you know, Mr. Editor, even the bones of John have to return to China—the very safety of his immortal soul demands the pig-tail, and a final

resting-place within the borders of the Flowery Kingdom. Damnation is for him averted *per contract*, and his forwarders to our shores agree to return him, dead or alive. He *cannot* stay here! And this is the conclusive argument against the Chinaman. Not that he works for too small wages, not that his rate of living is too low, but that he comes here as a parasite—to feed upon our substance, not to increase it. In and about the city of San Francisco there are many thousand Italians, who, with the Chinese, monopolize certain work, especially market-gardening and fishing on the Bay. They live for at least as little as the Chinese, they work for as small wages, they have made it impossible for Americans to compete with them in their chosen labor; yet no man ever heard any Californian propose a restriction of Italian immigration. The Italian comes here to stay; his family, if he has any, comes with him; poorly qualified as he is to become a citizen of a republic, he is welcome. We have faith to believe that his children will be an improvement over their father.

So it is, Mr. Editor, that those of us who read the *Nation* are aggrieved, and we think justly so, at its tone toward us. We are—that rarest thing—a community unanimous on a question of public interest. And when we see the *Nation* sneering at us, confounding what we conceive to be unanswerable arguments in our favor with the nonsense of demagogues, or the utterances of ill-advised friends, we have a right, we think, to ask you, is this ignorance or malice?

Piloting an old Eastern friend of mine the other day through the garbage-heaps of the Chinese quarter, I said to him: "Do you notice anything peculiar in the appearance of the hundred or so Chinese children whom we have met?" "Nothing peculiar—excepting the difference of costume and race, of course—but they all seem to be boys. Not one in ten is a girl. Why is that?" The question was to me at first a poser, but on taking counsel with a Chinese acquaintance of mine I learned (after considerable cross-questioning) that a prejudice exists among our soft-voiced Oriental friends against girl babies, and that as soon as these are born they are quietly made away with—except, of course, such as are wanted for purposes of prostitution or for sale as servants. "All lightee in China!" observed my Mongolian friend. And these are the "industrious, frugal" immigrants whom you wish to force upon us! Do you wonder we object to them somewhat?

Very respectfully yours,

SAMUEL BRADLEY WIGGIN.

SAN FRANCISCO, January 1, 1884.

[We are willing to amend the first of the above passages so as to make it read "for no better reason than that they worked for too small wages, that their standard of living was exceedingly low, and that they refused to remain permanently in the country either alive or dead." We do not see our way to amending the last one. By "certain classes," we mean the lazy, improvident, and dirty Caucasians, and we must maintain that to them the spectacle of Chinese frugality, industry, and cleanliness is extremely irritating. There may be other reasons for detesting the Chinese, but with some people this is "of itself a reason."—ED. NATION.]

THE ISSUE OF PAPER MONEY BY THE BANK OF ENGLAND.

TO THE EDITOR OF THE NATION:

SIR: Is the *Nation* quite true in saying (issue of Jan. 3, p. 3) that "the issue of paper money is left to the banks by all solvent governments?" Did not Peel's Bank-Charter Act of 1844, in England, separate, as far as then practicable, the issue of paper money from banking business proper, as a preliminary step (in the view of Sir Robert Peel, Lord Overstone, Torrens, etc.) to the final abolition of all banks of issue in the kingdom save one, which should have no connection with the business of discount and deposit? The issue department of the Bank of England was by that act entirely separated from the banking department. Sir Thompson Hankey, Governor of the Bank of England in 1851–2, says on this point (v. p. 2 of his work on Banking, 3d Edit., London, 1876): "Since 1844 the Directors have had no control over that part of the currency which consists of bank notes; that is, they have had nothing whatever to do with the amount at any time in circulation in the country." No other bank of issue is permitted in London, and the amount which other—country banks, as they are called—may issue, is restricted by the same act. No new bank of issue can be created; and the law is so framed as to favor the relinquishment of much of the country-bank circulation, with a view to future fresh arrangements for the total extinction of country bank-note circulation.

J. McLaren, in his 'History of the Currency' (2d Edit., London, 1879, p. 183), says:

"By this act no new banks were to issue notes, and any bank already existing which ceased to issue them was not to be allowed again to resume that privilege. All private banks, too, were limited, under heavy penalties, to the average amount of their issues for the twelve weeks preceding the 17th day of April, 1844, and the Bank of England was allowed to compound with issuing banks for the transfer to her of that privilege; the object of all these provisions being evidently the gradual extinction of the private issuers. By this act it was also provided that the Bank of England might issue additional notes upon securities, to the extent of two-thirds of the lapsed issues of the country bankers, on being authorized to do so by an order in council."

Pardon my calling your attention to this point. It seemed of too much consequence to pass unnoticed.

Yours with sincere respect,

E J. LEONARD.

MERIDEN, CONN., January 9, 1884.

[We do not see clearly what our correspondent's point is. We never said that all banks in England issued notes, or that any bank had the power of fixing the amount of paper circulation afloat. What we said was that all solvent governments leave the issue of paper money to the banks, which is true of England as of other countries. The Directors of the Bank of England do not fix the amount of paper afloat any given time. No bank does or can do that. But whatever paper gets afloat in England is issued by them, under certain legal restrictions providing for redeemability. It is a mistake to suppose that the Issue Department is not part of the Bank of England. It is, as Bagehot says, "half" of the Bank, and issues such paper as the Bank is permitted by law to put afloat, and the paper thus put afloat is all the paper money there is in England. None is issued by the Government, as the Exchequer Bills are not money.—ED. NATION.]

CABINET OFFICERS IN CONGRESS.

TO THE EDITOR OF THE NATION:

SIR: Apropos of the discussion of the executive-government question through your columns, it is well to remember that circumstances have already necessitated a far closer connection between our legislative and our executive than at first sight would appear to be the case. There are probably many persons whose objection to the presence of Cabinet officers upon the floor of Congress lies in a vague fear of too close an association between these two coördinate branches of the Government, who, if aware to what extent such association now exists, would prefer to make it public and to subject it to some sort of regulation, rather than give continued opportunity to secret and unofficial relations.

The English Cabinet is an evolution, and what is regarded as the essential instrument of parliamentary government is a body unknown to the laws. In this country a written constitution has restricted the growth and modified the form of what, under a different experience, would doubtless have taken on the characteristic features of its English prototype. Ever since the administration of Washington, as, to a certain extent, even during his administration, it has been customary for heads of departments to be consulted by members of Congress and by committees as to methods and ends of legislation, and often to act initiatively in bringing to the attention of Congress objects in their opinion requiring its action. The Constitution authorizes the President to make recommendations to the law-making power, and thus clothes the Executive with a *quasi*-legislative authority. The long reports from every branch of the administrative system, packed with facts and bristling with suggestions and theories, which are discharged upon Congress at the beginning of every session, are in their way indications of the necessary relation between the law-making and the law-enforcing powers. It is, moreover, a common thing for bills to be prepared in the departments and then passed by Congress, thus in an indirect way allowing the Executive to enact laws. The newspapers have lately given us the chief provisions of an important bill, prepared at the State Department, for conferring extra-territorial jurisdiction upon a number of our consular representatives; and similar instances as to other departments have been made public.

Not many persons, probably, would object to these things, for certainly the service of special knowledge and of great experience is thereby secured in aid of wise legislation. But why, if conference and coöperation between the executive and the legislative branches be both inevitable and capable of being beneficial, should not steps be taken in recognition of these facts, and in the direction of their publicity and their healthful operation? It is vain to attempt to delude ourselves with words. What do we mean by the "policy" of an administration, if that administration's only duty is the mere routine of doing prescribed things in a prescribed way? The fact is that an executive "policy" is possible even with us, and we expect it to be so. The presence of Cabinet officers in the House and Senate would necessitate a consistent policy upon the part of the Administration, for it would be always subject to examination, to inquiry, and to the necessity of self-defence and self-justification. It would raise the *personnel* of the Cabinet in respect of ability and reputation. It would save both time and money. It would vastly tend to purity and openness in public matters. Whether it would also in time render necessary the incorporation of the other principle, of ministerial responsibility, into our system, and whether such a result is to be desired, are questions pregnant with importance, and from whose discussion no harm can come.—

Respectfully, C. A. TOWNE.

LANSING, MICH., January 14, 1884.

To the Editor of The Nation:

Sir: I think I have detected in the *Nation* a dislike to controversies between your contributors. Luckily there is no need that "G. B." and myself should offend your reluctance. The inference I read out of or into M. de Laveleye's paper in the *Contemporary* was not his main purpose, but I think a fair corollary. Whatever his purpose in citing them, the facts he stated showed a marked instability and weakness in the conduct of government in several countries named, where the Cabinet sits with the Legislature, and where the executive and legislative are representative and closely identified. It seems to me that "G. B." projects an a-priori scheme of government, and then disclaims any responsibility of using forecast as to how it will work. But he is bound to use forecast and wise prevision when he touches the machinery of a clock or a government.

I do not share at all his desire to relieve either the national executive or legislature of that paralysis of functional efficiency he deplores. I cannot recall any scheme of overt statesmanship since the war, planned by either President or member of the Cabinet, the failure of the adoption of which has been a serious harm to the country. "G. B." complains that since the war, Congress has never been able to do anything at all. That reminds us that M. de Laveleye, in the article before referred to, says: "Every year, Mr. Gladstone, whose inexhaustible activity has been spent in obtaining so few results, laments, with an eloquent sadness, the sterility of the session." So the trouble is not ours alone.

In fine and finally, as much risk of harm as of good goes along with any increase in the efficiency of government. The inability to do, which "G. B." complains of in our General Government, exists in all representative governments, so that to give the Cabinet and Executive a more direct legislative power and seats in Congress does not promise much help; and until election of Federal officials by the people, or a fixed and stable civil service, takes this tremendous power and burden of patronage away from the President and heads of departments, I for one do not want to see the relation between these and Congress made closer, or the legislative power of the Executive increased. S. M. C.

Keokuk, Iowa.

DR. CLEVENGER AND THE UNIVERSITY OF CHICAGO.

To the Editor of The Nation:

Sir: In your notice of Dr. S. V. Clevenger's interesting paper in the *American Naturalist* for January, you say that "the foot-note which the author appends to it is valuable also as a contribution to the history of the higher education in this country." Perhaps this is true. But it seems to me that it is valuable also as showing how the most pronounced materialism may go hand-in-hand with a truly Oriental imagination; or as a commentary on the boasted superiority of the study of science over the study of the classics, by its tendency to develop that saving enthusiasm for plain facts which reports "the things that are as being, and the things that are not as not being"; or, again, as showing that the passion for the martyr's crown is not confined to the poor deluded products of Sunday-school training.

To begin with, there is no "Chicago University Club." A few years ago a number of persons living in the neighborhood of the University of Chicago arranged to meet once a week for friendly discussion of literary, political, scientific, and social topics of the day. This developed into an organized club, at first under the name of the "Nation Club," subsequently changed to the "University Club"—in recognition, I suppose, of the courtesy of the University authorities in permitting the club to hold its meetings in one of the rooms of the University building. And this is all the connection there is between the University Club and the University of Chicago.

The "Baptist clergyman" who is President of the University, a gentleman well known and highly esteemed both East and West, and one of the most liberal of men, has never been a member of this club, has, so far as I know, never been present at any of its meetings, was certainly not present when Dr. Clevenger's paper was read, and will probably have his attention called to the "Disadvantages of the Upright Position" for the first time by this notice in the *Nation*. It is not clear, therefore, what the "Baptist clergyman" has to do with this matter, or how the reading of the paper in question could have "cost Dr. Clevenger an appointment to the chair of Comparative Anatomy and Physiology in the University of Chicago," especially as there was no such chair waiting to be filled—although no one who knows Dr. Clevenger could doubt his eminent qualification to fill such a chair with marked success. And yet all this, upon reflection, leads me to think that you were right after all (as you almost always are) in saying that the author's foot-note is a valuable contribution to the history of the higher education in this country.—Yours truly,

Edward Olson.

University of Chicago, January 19, 1884.

STATE AND LOCAL TAXATION.

To the Editor of The Nation:

Sir: The method of raising State taxes indirectly instead of directly would, as your correspondent, Mr. Clark, suggests, promote ease of collection; but from what would this advantage arise? From the fact that under indirect taxation the masses of the people do not know when and how much they pay. Can a Government which is professedly "for the people and by the people" honorably take advantage of the ignorance of the people?

The working of the indirect system has undoubtedly done much to promote the extravagant expenditure and almost unlimited corruption which stain the reputation of our national Government. There is nothing to indicate that the system would be attended by any less evil if applied to the individual States. The question of the disposal of surplus revenue would soon be answered if every man knew just when and how his share of the unnecessary amount was collected. W. H. Johnson.

Granville, O., December 28.

THE MANNERS OF WORK-PEOPLE.

To the Editor of The Nation:

Sir: I have just read with interest your editorial on "Domestic Service" in the *Nation* of the 3d inst., but I cannot agree with your conclusion that "there is no formidable reason why the man or woman who works with the hands should not be externally as polite, have as pleasant a voice, speak as good English, make as good a bow, and be as considerate and careful about other people's convenience and comforts and feelings as those who work with their brains, or live on their investments."

It seems to me not difficult to explain the inferior mien and manners of work-people, and to show that they will necessarily continue inferior unless the race arrives at Mr. Mill's stationary age when a degree of leisure will be the attainable ambition of even manual laborers. Any well-bred and educated man who has had personal experience of physical toil, knows that when fatigue has given at least a temporary stiffness to his limbs, and a husky inflexibility to his voice, his manners are not at their best. As the plantation proverb has it: "De proudness un a man don't count w'en him got de misery in him legs." But if well-bred and educated people can experience the ill effect on manners of muscular fatigue, how great and inevitable must be that effect on those who have never had the leisure to cultivate either their manners or their minds, but who, their day's work ended, are too fatigued to practise those little acts of helpfulness which are the useful side of courtesy, as the graces of speech and behavior constitute its charm.

No explanation of the inferior manners of hard-worked people would be complete which should omit the physical effects of muscular toil. These effects are plainly exhibited by men who, like the New England farmers, are in a high degree self-respecting and in no small degree intelligent. Men and women whose bodily powers are always taxed to the utmost, and whose limbs often ache with weariness, are not likely to invent, or even to imitate, those "happy ways of doing things" which Emerson called good manners. Inconvenienced and uncomfortable themselves, they are not likely to study the convenience and comfort of others. Those minor acts of courtesy which to people of leisure are a kindly pastime, demand of them a degree of exertion and forbearance to which their toil-worn frames are unequal.

Sue Harry Clagett.

Portland, Oregon, January 12, 1884.

Notes.

John Wiley & Sons will publish immediately a "people's edition" of Ruskin's works, beginning with the 'Modern Painters,' which, for example—five volumes, bound in two, with all the wood engravings—will be sold at two dollars. They also announce a 'Ruskin Birthday Book,' and 'The Air We Breathe, and Ventilation,' for the use of tenants, physicians, architects, etc., by Henry A. Mott, jr., Ph.D.

The *Book-Buyer*, published by the house of Scribner for the ten years ending 1877, will be revived on February 1, even to the regular London letter from Mr. Charles Welford. It will contain a concise summary of American and foreign books.

Froude's paper in the *Contemporary* on Luther, based on Köstlin's Life, has been reprinted by Charles Scribner's Sons in a cheap authorized edition, in large print, with paper covers.

Mr. Abner C. Goodell, jr.'s curious archæological research among the 'Seals of the Judicial Courts of the Colony and Province of Massachusetts Bay—1680–1780,' reprinted, with the drawings of the seals, from the Proceedings of the Massachusetts Historical Society; and the same author's still more valuable account of the 'Trial and Execution for Petit Treason of Mark and Phillis, Slaves of Captain John Codman'—these slaves having murdered their master in Charlestown in 1755, and the man been hung and the woman burnt at the stake in consequence—reprinted from the same Proceedings, are obtainable of Soule & Bugbee, Boston. The second paper also notices other cases of burning in Massachusetts, and is in many ways a helpful illustration of the history of American jurisprudence and growth in civilization.

The new, revised, and enlarged edition of Dr. Philip Schaff's 'History of the Christian Church' (Charles Scribner's Sons) has now reached its third volume, which deals with Nicene and Post-Nicene Christianity, from Constantine the Great to Gregory the Great. The fourth volume, on Mediæval Christianity to the time of the Reformation, will appear ere long.

One of the fruits of the new policy by which Leo XIII. throws open the Vatican Library is the appearance at Vienna of a volume containing two hundred documents found in that library relating to the deliverance of Vienna by Sobieski in 1683. The work contains one hundred and thirty-five autograph letters of Innocent XI., Leopold I., Sobieski, and others. Two similar volumes, relating to Clement VII. and Honorius III., are to follow.

Prof. Goodwin's report on his directorship of the American School of Classical Studies at Athens, just printed in the Bulletin of the Archæological Institute of America, makes an interesting document of twenty-four pages 8vo. It gives a pleasant picture of the friendly reception accorded to the new-comers by the citizens of Athens, of the courtesies extended to them by the French and German Schools, of the assistance rendered by the American Minister and other countrymen resident or viatic, and of the temporary habitation of the School (near the Gate of Hadrian), with its broad and inspiring views. The students have been sufficiently numerous and diligent, and some of their theses may yet be printed if the School be enabled to publish a bulletin. The field of study and research is of course inexhaustible. The drawbacks are the want of a fixed home, of a larger income; above all, of a permanent resident director in place of the annual substitution of a professor from one of the contributory colleges in turn. Professor Goodwin thinks that $120,000 would serve as an adequate endowment of the School, and seems sanguine of obtaining this amount, which provides for the employment of a first-rate man as director. Incidentally some sensible remarks are made on the desirability of applying the modern Greek pronunciation to the ancient in teaching—the great impediment to which is the confusion of the seven ancient vowel sounds in one sound (*ee*).

Apropos of the study of classical Greek, we have before us the current catalogue of the Roxbury (Mass.) Latin School for the 239th year of this venerable institution. Its summary view shows that, in spite of its notoriously high standing of instruction, the percentage of hours of recitation given to Greek (.15) falls below that of English (.20) and Latin (.25), and but little exceeds that of Mathematics (.13).

Two papers among those printed at length in the Proceedings of the American Oriental Society, at New Haven in October last, will interest scholars, viz., that by Prof Isaac H. Hall, on "A Temple of Zeus Labranios in Cyprus," and that by the Rev. John P. Peters, on "The Egyptian and Old Babylonian Theories of the Origin of the Phœnician Alphabet Compared," in criticism of the Rev. Isaac Taylor's position in his work on the 'Alphabet.'

The Sixth Congress of Orientalists, which met last September, at Leyden, passed a resolution calling upon the British Museum to send out its manuscripts to be used in other cities and foreign countries, as do many of the great Continental libraries. It is to be hoped that the demand will not be granted. No library has a right to run such risks. A manuscript destroyed is lost not only to the library, but to the world. If it has not been printed or copied, it can never be replaced. If it has been copied, either it has no value above the copy, in which case the copy would do as well, or it still has a unique value of its own, which should not be exposed to risk. The fate of the manuscripts lent to Mommsen is a proof of this. But as the British Museum does not allow its printed books, the greater part of which are not irreplaceable, to leave the building, it is by no means likely that it will risk its more precious manuscripts.

Quakers will be glad of the defence of their nominative use of *thee*, as a survival instead of a solecism, in an article on "The English Dative-Nominative of the Personal Pronoun," by F. B. Gummere, in the current issue of the *American Journal of Philology*. Mr. J. Rendel Harris concludes his important papers on stichometry as applied to the Four Gospels particularly, with conclusions favorable to the last twelve verses of Mark having been included in the standard copies for the MSS. examined, and unfavorable to the authenticity of the passage concerning the woman taken in adultery, in John.

The third number of the third volume of 'Appalachia' (Boston: W. B Clarke & Carruth) is a full one, and has the usual value for reference and preservation. It is perhaps desirable not to set a premium on literary charm in these accounts of mountain-climbing, for fear of encouraging "fine writing." Still, the reader would occasionally be cheered to find a poetic gift of description added to enthusiasm in the special work of the Club. The promise, for example, of the paper on the "Mountains and Scenery of Jamaica" is hardly fulfilled. Among the useful labors of the Club during the past year has been improving the access to the Twin Mountain range in New Hampshire and to Mt. Ktaadn in Maine. A panoramic outline of the Presidential range from Jefferson Highlands is folded in with this number. Professor W. G. Farlow contributes pretty full notes on the cryptogamic flora of the White Mountains. The other writers are of both sexes, representing fairly the membership of the club in this respect.

Le roi est mort. Vive le roi! "V'lan," successor of "Pschutt," has left the throne to "Tschock." This new King of Argot is evidently a distant relative of Shocking. He will reign six months and give way to another, or perhaps be succeeded by anarchy.

Rouam, the Paris publisher, has in preparation what promises to be an important addition to Raphael literature, by Eugène Müntz, entitled 'Les Historiens et les Critiques de Raphael, 1483-1883, Essai Bibliographique,' intended to serve as a supplement to Passavant's standard biography. The writers upon Raphael between 1483 and 1883 will be passed upon critically.

In Berlin, from the publishing house of Weidmann, will shortly appear the first volume of a life of Lessing, by Professor Erich Schmidt, entitled 'Lessing, Geschichte seines Lebens und seiner Schriften.' Professor Schmidt's previous contributions to German literary history of the eighteenth century, including a life of 'Heinrich Leopold Wagner,' augur well for an adequate and scholarly biography.

A collection of posthumous essays by Reinhold Pauli, the biographer of Simon de Montfort, and a writer of merit upon English historical subjects, containing studies upon Durham, Henry V. of Lancaster, Beginnings of Henry Eighth's Reign, Thomas Cromwell, House of Hanover upon the English Throne, Sir Robert Peel, Chevalier Bunsen, is announced by Hirzel of Leipzig, under the title 'Aufsätze zur englischen Geschichte.'

The last *Lieferung* of F. Sander's 'Lexikon der Pädagogik' contains some interesting tables showing the distribution and great over-production of text-books in gymnasia, progymnasia, and higher burgher schools. Formerly the Government selected a number of text-books in each department as a so-called "canon," and local boards or teachers had only the right of selecting from these. A few years ago, however, this right, which is still maintained in Austria and Bavaria in part, was renounced in Prussia in order to "keep alive an active interest in improving the means of instruction on the part of teachers, and destroy monopolies which had arisen in certain departments." As a result, text-books have multiplied enormously, but more from the initiative of authors than of publishers. Of 1,544 text-books, 668 are used in only one establishment, and for the most part where the author teaches. In 1880 there were 99 different text-books of mathematics in use in Prussia alone, of which 55 were used in but one institution; of 65 text-books of natural history, 36; of 85 text-books in French, 44; of 160 religious text-books, 80; of 201 books of song 110 were used in only one school. This state of things is permitted by collegial courtesy, and illustrates German subjectivism. Of the above 1,544 books, 233 were introduced in only two, 113 in but three schools. Of 226 books used in from 11 to 100 schools, 98 are used in from 11 to 20 schools, and only 11 in from 81 to 100 schools. Among the books most widely used is the French grammar of Plötz, the reading book of Hopf and Paulsiek, Daniel's geography, the Latin grammar of Ellendt-Seyffert, and the elementary mathematics of Kambly. The history of text-books and their distribution in our own country is beginning to attract wide attention, and when it is written out will be interesting reading, though in a very different way from the above.

'The Year's Art' (Sampson Low & Co.), now in its fifth year, comes as usual with full information as to English exhibitions, etc., for the year, legal decisions and enactments, with a brief addendum concerning the American institutions devoted to art. The Belt-Lawes case is reported, and the art sales of 1883, and a large number of small process illustrations diversify the dulness of statistics.

Professor Peters, of Hamilton College, who is abroad investigating the star catalogue of Ptolemy with a view to an accurate edition, has been fortunate in finding, both at Venice and at Florence, several MSS. (Greek, Arabic, and Latin) of the 'Almagest,' hitherto not utilized by modern scholars. He is now engaged in a prolonged research in the Vatican Library.

The British Association for the Advancement of Science has embarked upon a vigorous treatment of the subject of the tides. At the late meeting at Southport, the report of a committee, consisting of Professors G. H. Darwin and J. C. Adams, for the harmonic analysis of tidal observations, was presented, from which it appears, in the first place, that in India only has any extensive series of tidal observations, with systematic publication of the results, been conducted. The committee thus practically finding itself engaged in the reduction of Indian tidal observations, a conference was arranged with Major Baird, in charge at Poona of the Tidal Department of the Survey of India, and a general idea of the course of procedure was arrived at, and harmonious coöperation for the future secured. Mr. Neison, lately appointed the Government Astronomer at Natal, will likewise reduce the South African tidal observations according to the same uniform plan. Professor Darwin, who is responsible for the committee's report, although Professor Adams is in agreement with the correctness of the methods pursued, explains in this paper the entire process of the harmonic analysis instituted by Sir William Thomson, systematizing the exposition of the theory, and completing

the methods of reduction. In short, Professor Darwin's report forms a complete manual of the harmonic analysis as applied to the tides; and it has been drawn up in such form as to commend itself for adoption by all scientific bodies concerned with the proper discussion of tidal results.

A recent investigation by Professor Balfour Stewart, of the Owens College, Manchester, relates to the periodicity of the solar spots, and shows pretty conclusively that there are inequalities of short period in the prevalence and magnitude of the spots, in addition to the well-known long-period inequality, ranging over eleven or twelve years, discovered by Schwabe and elaborated by Wolf. A mass of thirty-six years of observations of sun spots was divided into three series of twelve years each; and, applying his own method of detecting unknown inequalities, Professor Stewart found two apparent sun-spot periods, each about twenty-six days in length, which came out very prominently by his treatment, appearing for each of the twelve years in the same phase and to very nearly the same extent. That there should be these lesser periods, of relatively brief duration, seems in very reasonable accord with the theory of sun-spot periodicity now held by the more competent solar physicists—viz., that it is due to causes inherent in the sun itself, and not extraneous to it, as was formerly believed. The details of Professor Stewart's research are not yet published, and the precise epochs of his new maxima and minima are not known. As for the greater maximum of sun-spot frequency, pertaining to the Schwabe period, it has quite certainly been passed, most likely at some time during 1883. A recent writer in *Science*, collating the observations of Professor Todd, of Amherst, from the middle of 1877 onward, thinks the indications unmistakable that the solar spots have already begun to wane; so that we may expect the minimum to be attained early in the year 1889.

A committee has been formed in London to erect a memorial to the poet Gray. It is proposed to raise £300, £200 to place a marble bust in the hall of Pembroke College where he died, in the niche opposite Chantrey's bust of Pitt, and £100 more to place a bronze replica in the Fitz William Museum. Mr. Hamo Thornycroft is the sculptor selected. Among the members of the English Committee having the matter in charge are: Lord Tennyson d'Eyncourt, Mr. Alma-Tadema, Lord Houghton, Mr. Austin Dobson, Mr. G H. Boughton, Prof. Sidney Colvin, and Mr. E. W. Gosse, the poet's latest biographer. American contributions may be forwarded to Mr. H. C. Bunner, 23 Warren Street; Mr. R. W. Gilder, 33 East Seventeenth Street; Mr. Brander Matthews, 121 East Eighteenth Street; or Mr. Charles Scribner, 745 Broadway.

—It is with a feeling of sadness that we examine the first map bulletins of the Transcontinental Survey, of which Prof. Raphael Pumpelly has been the chief. This Survey shares the present low fortune of the railroad companies on which it depended, and will be suspended indefinitely. It was a characteristically large-minded conception of the late President of the Northern Pacific Railroad, who organized it first in the legitimate interest of the associated companies, and then of the future occupants of the great domain now opened up for easy settlement. In what direction should branch roads be built with a reasonable expectation of drawing immigrants thither or of obtaining freights, or by what routes most profitably between settlements already begun? What lands ought the companies to retain or to acquire or to keep from the hands of speculators? Where was the best timber? What was the capacity of the various soils? How could irrigation be promoted and the water supply be preserved? What valuable coal and mineral deposits were yet unsuspected? Such were some of the questions proposed to the Survey. They have been answered already to a degree justifying the service. These bulletins are the first elaborate cartographical records of the work done, and relate to the season of 1882. The Topographical Department, under the charge of Mr. A. D. Wilson, with the assistance of Messrs. R. U. Goode and Louis Nell, puts out a series of four maps in six sheets, representing the region about the Yakima River, Washington Territory, or northerly and westerly from the junction of the Snake and Columbia Rivers at Ainsworth; the Colville region in the same Territory, between the Columbia and Pend d'Oreille Rivers, north of the Spokane River; in Montana, the basin of the Judith, one of the southern affluents of the Missouri; and finally the Crazy Mountains and vicinity, or the district north of the Yellowstone between Stillwater and Bozeman. These maps, which show the contours of elevation, are upon a scale of two miles to the inch, and reductions of them serve as the basis of those about to be mentioned, namely, first, of the Agricultural Department, in charge of Prof. E. W. Hilgard, of the University of California. The maps in this instance are two—an eastern and a western sheet for the Yakima region—and are colored to indicate the diversity and quality of the soils, which have been analyzed in the most careful manner by Prof. Hilgard. A text accompanies this bulletin, by a necessary and fortunate exception. The third bulletin proceeds from the Forest Department, and consists of the western Yakima sheet colored for timber, under the direction of Prof. C. S. Sargent. The execution of all these maps, it is enough to say, is by the house of Julius Bien. It will be a great pity if the work of the season of 1883 is not made available in corresponding form.

—*Lippincott's* for February opens with an illustrated article on Germantown which contains several good sketches, and the text of a curious old anti-slavery document issued in 1688 by the Germantown Quakers. It begins as follows:

"These are the reasons that we are against the traffic of men's body, as followeth: Is there any which would be done or handled at this manner?—viz., to be sold or made a slave of for all the time of his life? How fearful and faint-hearted are many at sea when they see a strange vessel, being afraid it should be a Turk and they should be taken and sold for slaves in Turkey! Now, what is this better done than Turks do?"

Alfred M. Williams writes about an "Indian Cattle Town" (Muscogee), and describes cow-boy life with a good deal of knowledge. The cow-boy is a figure in our national life whose acquaintance we in the East have made through newspaper despatches within a very few years. Most of us can remember with pleasure the time when we did not know what a "cow-boy" was, nor that we ourselves should, if known to the cow-boy world to exist, be classified as "tender-feet." We know now pretty well what the cow-boy view of the tender-foot world is, but the cow-boy seems to have no realizing sense of what the tender-foot world at large thinks of him and his life. The puzzle about the cow-boy is why he should be such an awful wretch. There is nothing in his life or calling to madden him into continual crime. "Rounding up" cattle may call for more strength and endurance and power of lung than the old-fashioned practice of "calling the cattle home"—a task, as we know from the words of the familiar song, which was once committed to the charge of innocent young girls—and is, therefore, naturally committed, in the cattle country, to boys and men (for we take it that a cow-boy is not necessarily a minor). But why is it necessary for the cow-boy as such to commit so many crimes, and to take the same wanton delight in crime which in the tender-foot world is associated not with pastoral pursuits, but with those of the worst outlaws in the foul slums of great cities? We say necessary, for the cow-boy appears to be entirely exempt from punishment, and when he "cleans out" a town, the inhabitants appear to regard his visit rather as an honor than otherwise. In "Our Monthly Gossip" will be found a clever attempt at a translation of the French monologue called "The Fly," well known probably to all who have much acquaintance with the modern French stage, or with Franco-American private theatricals. We have heard "The Fly" admirably given in a New York parlor, but it was in French. It might be worth while to try Mrs. E. W. Latimer's translation, though in English much of the flavor of the original evaporates. Such a monologue is an excellent test of acting, for it needs neither scenery nor costume, and admits of no horse-play to eke out the humor. For these reasons—but we say no more.

—The *Century* promises a new achievement in wood-engraving—cutting the block directly from original pictures of the old masters—and has sent Mr. Cole, unquestionably *facile princeps* in this kind of work, to Europe for a course of it. This will bring first-class reproductions of the best pictures of the old masters into the easy possession of everybody who cares to possess them, and we can readily believe that they will even surpass photographs of the same pictures, as color values are in photographs never rendered. In the February number, a full-page "original engraving" by Elbridge Kingsley does not, to our mind, make a case for that form of cut, either as design or as wood-cutting. The article on Dante, by Miss Rossetti, is one of those condensed results of long study and familiar knowledge which we might expect from a member of that Dantesque family, and the illustrating portraits of Dante are excellent. An article on Courbet seems written to show how little the author knew of Courbet's real position as a painter. He writes around the theme, and says next to nothing of the technical qualities of his subject, and that little wrong. "His strongest point, technically, was color; his weakest points were drawing and composition." Now, Courbet was not a colorist except as color is involved in general values: his strong point was in his mastery and rapid expression of the values of his subject. His color was often heavy and not always true as color, but rarely did he fail to strike at once the relative key of what he touched. The criticism of an artist of so intense individuality as Courbet could only be done by some one in sympathy with him, which the author of this article certainly is not.

—The *Portfolio* for January contains three interesting full-page illustrations—an engraving from Sir Joshua's "Mrs. Pelham Feeding Chickens"; the front of Rheims Cathedral (an etching by Toussaint), and a water-gate in Venice, by Joseph Pennell. Mr. Pennell has a happy perception of the picturesque in subject and the pictorial in treatment, but there is one lesson he has not learned, and one of the most important to really good etching, as to any other form of line representation, viz.: that every line ought to have some relation to the form which it helps to represent, and that such scrawling as fills the water of his etching with reflections that suggest only hair-snakes meandering over the sur-

face—without regard to perspective or foreshortening—implies simply bad drawing, or, in default, what is worse, indifference to the meaning of his lines. He may take a lesson from the Cathedral etching in the same number, where the foreground, in which there is far more excuse for scrawling, being ground, is put in in simple horizontal lines, while the sky shows cloud forms exquisitely developed by lines following the contours with severity. This fashion of skirmishing around with the needle-point, with no relation to the facts to be expressed, is an affectation and a vice, no matter who may adopt it, and almost infallibly the indication of a bad draughtsman. Mr Pennell's water-drawing in this etching is bad as form, bad as reflection, and bad as tone. A curious study into copyright and its piracy, apropos of Hogarth, in the *Portfolio*, is illustrated by reproductions of some of the piracies of his "Rake's Progress"; and an article on the "Birds" of Aristophanes, by process prints of groups from the play as recently given at Cambridge. The article, by the editor, on "Soul and Matter in the Fine Arts," should be carefully read by every would-be art critic without practical knowledge of art, as a convincing argument that he proposes carrying water in a basket. The whole number is one of unusual interest.

—The *Magazine of Art* for February is as commonplace as usual in illustrations—a poor full-page cut from a statuette by Dalou as frontispiece, and a number of reproductions of pictures, in the collection of Mr. Ionides, presenting no great evidence of the taste of that collector, or the quality of the engravers for the magazine. The first number of the *Art Union* does not promise to render material return for the price of subscription. It is cheaply printed, and the illustrations serve simply as indications of the pictures in the exhibition of the society. For this purpose they are good enough; but the etching is hardly worth the cost of printing. The literary matter of the *Art Union* will hardly bear criticism from the literary point of view, yet the artists must and ought to have their say on matters of art. It is a common error to suppose that artists are unqualified for criticism, whereas, on the contrary, no one who has not a greater or less cognizance of the methods of art, gained from actual experience, is qualified to write of the subject. An artist may be a one-sided critic, and a small-minded artist will certainly be a narrow and prejudiced critic, feeling that art has but one side- his own; but, taken in the aggregate, the opinion of the body of artists is the only final and irrevocable judgment on one of their profession, while a man who cannot paint up to a certain point is incompetent to judge or pronounce on painting. This feature of the *Art Union* will be an acquisition—all the more if the superintendence be that of a good littérateur.

—A correspondent writes us:

"Mr. John B. McMaster, in his 'History of the People of the United States,' says (page 530): 'He [Alexander Hamilton] had been present in the Federal Convention from the morning when Randolph brought forward the Virginia plan to the morning when the Constitution, finished and engrossed, lay upon the table for signature.' On the other hand, Mr. Henry Cabot Lodge says, in his Biography, in the American Statesmen series, that Hamilton 'was absent a large part of the time from the Convention.' As Mr. McMaster seems to assert the continuous presence of Mr. Hamilton in the Convention, and uses that asserted presence as a witness to convict him of duplicity and dishonesty, he should be careful not to overstate or misstate his fact."

—President Eliot's annual report to the Board of Overseers of Harvard University ends with a pointed reminder to this body that they are old and likely to be fogyish, and intimates that the younger alumni whose votes elected them might profitably choose successors nearer their own age. The next most salient passage in the report is that which announces the discussion by the Faculty "of the gravest question of University policy which has arisen or is likely to arise in this generation, namely: the extent to which option among the different subjects should be allowed in the examination for admission to college." Here we must doubtless read between the lines "a college fetish"; for no other study than Greek would merit so awful an allusion to its possible relinquishment. What follows, as to the evolution of the Harvard Faculty in fifteen years, is worth the attention of other colleges. The twenty-three members in 1869 have become fifty-seven in 1883, the latter number containing eleven representatives of branches unrecognized in the former, and consisting of instructors in mathematics, physics, chemistry, and natural history, to the extent of one-third. Even music and physical training are now represented—the latter, at least, most appropriately. President Eliot has some statistics as to the sections from which the students are derived. They indicate a steady diminution in the New England contingent, and a sharp falling off in that from Massachusetts, where the growth of a Butler constituency has evidently not been favorable to the higher education. Special students (not candidates for degrees) are markedly on the increase in the College; in the other departments doubtfully so, unless rallying from a decline. "No undergraduate is expected to attend during the last three years of his College course more than one-tenth of the elective instruction which the College provides." The quality of the Divinity students is improving, "and now leaves little to be desired." They represent several denominations, and are listening to weekly lectures from an Andover professor "on the doctrines of sin and redemption"; and, of late, "students of evangelical opinions have carried off a large share of the best scholarships." Both the Law School and the Medical School have gained new buildings of exceptionally fine construction. The Dental School, on the other hand, whose sole property is a few chairs and implements and a graduates' fund of less than a thousand dollars, is still the neglected department *par excellence*, though none is more deserving, and none attracts so many students from abroad. We can only make passing mention of a standing committee of the Faculty which is to serve as a medium of conference with the students—an innovation which cannot be too highly commended.

—The extent of lottery gambling in Italy is shown by an item in an Italian paper, stating that the recent death of Professor De Sanctis caused so large a purchase of lottery tickets bearing numbers corresponding to that event, in the tables of incidents and things, that the Government made two million lire ($400,000) out of the blunder of the augurs. According to the system of lotteries in use in Italy, the player writes down in his ticket five numbers, which are copied on the counterfoil and in the book of the bank from which the ticket is taken; and if the first three numbers drawn from the wheel of fortune are contained in these five, the player wins a *tern*, while if the whole five agree with those chosen by the player he wins a *quinquaine*, which gives a prize many times greater than the sum played, a *tern* giving one correspondingly low. When, therefore, any public disaster or extraordinary event occurs, the printed tables of lottery numbers being generally consulted, the same numbers are certain to be chosen by many players, with the usual result of a large gain to the Government, but in exceedingly rare instances a great loss, as the fortuitous coincidence of the numbers indicated by the tables with those drawn from the wheel would result in a run of luck to the players which might be an embarrassment to the Treasury; though, as there is no certainty that any prize will be drawn, the chances are enormously in its favor.

—The recently-published Report of the Commission appointed by the Italian Parliament to inquire into the condition of agriculture, gives a variety of information on several topics in which foreigners as well as Italians are interested. Seekers after health will be glad to receive its full particulars as to the dryness of the atmosphere in different localities. In the valley of the Po, as a whole, the average number of days on which rain falls in the course of the year is 88—not much more than half the average number north of the Alps. But the climatic differences within this region are very important. While at Milan the rain falls only on 72 days in the year, at Pallanza, not far away, the number of rainy days is 129; at Naples it is 123. At the village of Susa snow remains during seven months of the year, while in the near vicinity of Arta the thermometer, one year with another, seldom sinks to the freezing point in January. Tropical fruits now flourish, however, only in the most protected localities, though 300 or 400 years ago they were abundant in many places from which they have now perished altogether. This change of climate is attributed by the Commission to the cutting away of the forests, which brings on an earlier spring and thus subjects the precocious fruit to the blighting influence of cold winds in April and May. The Report also gives some interesting facts in regard to the cost of transportation, and the slowness with which agricultural improvements are made. The price of freight from Antwerp to Ancona is only thirty francs per ton, while from Genoa to Ancona it is not less than sixty—a discrimination against short distances only to be matched in America. A similar discrimination shows itself in the fact that the price of transportation from Genoa to Sardinia is greater than the price from Genoa to New York. A review of the agricultural condition of the people ends with the somewhat startling declaration that "the only agricultural improvement brought about within the last hundred years has been through the introduction of the threshing machine." The deplorable condition of agriculture is attributed chiefly to the shortness of the periods for which lands are rented. The complaint is the same that is so often made in England and Ireland. The farmer has no interest in making permanent improvements, inasmuch as such improvements either take away his chance of renewing his rental or oblige him to rent at a higher rate. By a custom so prevalent as to amount to law, farms are never taken for periods of more than nine years, and the length of the rental is usually much shorter. The Commission recommends a lengthening of the term to fifteen or twenty years, in order that the farmers may have greater inducements to avail themselves of improved machinery. It is interesting to note the manner in which the field hands are paid. Each adult male receives from 100 to 120 lire ($20 to $24) in money; 10 hectolitres (27 bushels) of grain, in about equal parts of wheat, rye, and maize; the free use of a dwelling and garden, and certain other small perquisites. It is estimated by the Commission that the Italian peasant receives all in all, as wages, the equivalent of about 600 francs ($120) a year.

—Rastislav Fadeyeff, the Russian General whose death was announced some ten days

ago, was one of that small group of officers in the service of the late Czar whose popularity rested not merely on military services, but in an equal measure on boldly-pronounced views on matters of Imperial policy. His two rivals in the favor of the nation were Generals Tcherniayeff and Skobeleff—the former a man of the same age and school as Fadeyeff (who was born in 1824), and the latter fully twenty years their junior. All three were leaders in the field of Panslavic thought and action, but Fadeyeff, though actively serving many years in the Caucasus, at Sevastopol, and elsewhere, attracted attention chiefly by his writings, while Tcherniayeff and Skobeleff won laurels in Turkestan and in fighting against the Turks, and made themselves, besides, conspicuous by reckless personal agitation. Fadeyeff was far superior to the two others as a man of serious thought and high culture, but was as decided a Panslavist and as intense a hater of Turkey, Austria Hungary, and everything likely to oppose or check the advance of Slavdom, as either of them. His writings, most of which have been translated into German, are remarkable for maturity of thought, clearness, and vigor. His essays on the military power and military policy of the Russian Empire, which he published after Prussia's triumph over Austria in 1866, made a powerful impression. Their political tendency was as unequivocally directed against the victors as against the vanquished in that short grapple of the German Powers, but the leading idea was, *Austria delenda est!* The road to Constantinople led through Vienna. The sooner that road was taken by Russia, the surer was the triumph of her cause, which was that of freedom in all Eastern Europe. There was danger in delay. Fadeyeff, most unpleasantly surprised by the unexpected achievements of Prussia, urged reforms in the army with the same zeal which marked the simultaneous advocacy of military regeneration in France by General Trochu. The French General had soon to learn that his advice came too late for France. Military Russia, too, was stunned by the terrible blows which in 1870 prostrated their only possible ally in a struggle of the Slavic world with the Germanic. An assault on Austria-Hungary had become impossible, and the road to Constantinople now led across the lower Danube. Tcherniayeff began the Russian war-dance in Servia in 1876, proclaimed Milan King, and made a failure; Skobeleff, in 1877-8, shone as a hero at Lovtcha, Plevna, and Shipka, and advanced to the very gates of Constantinople; but Fadeyeff's share in the contests of those years was quite insignificant. The result satisfied none of these Generals, and the subsequent agitations and plottings of the Nihilists rendered Russia equally wretched within and powerless abroad. Fadeyeff, who was connected by descent with the highest nobility of the Empire, and possessed the confidence of Alexander II., addressed to the latter a remarkable series of letters, frankly unmasking all the rottenness of Russian bureaucracy, and urging decentralization, the extension of the freedom of the press and of the administrative sphere of the provincial assemblies, and similar reforms—without any essential restriction of autocracy, however. On the assassination of Alexander II. these letters were published anonymously in Leipsic, both in Russian and in a German translation ('Briefe über die gegenwärtige Lage Russlands; 11 [23] April, 1879–6 [18] April, 1880'), and were subsequently allowed to appear in Russia. No field of activity, however, was assigned to Fadeyeff by Alexander III.

—English composers cannot complain that they are neglected in this country. Within the last two or three years quite as many novelties by them have been produced at our orchestral concerts as by German, French, and Russian composers. Of all these novelties, so far as we are aware, Cowen's "Scandinavian" symphony is the only one which has created a general desire for a repetition. The first movement of this symphony is a composition which neither Brahms, Liszt, nor Rubinstein would disclaim if he had written it. At the other extreme must be placed a MS. Serenade for orchestra by Mr. C. Villiers Stanford, which was produced at the Philharmonic concert on Saturday. The most noticeable thing about this serenade is an absence of everything resembling an idea, except an occasional diluted reminiscence of Mendelssohn. There is in it absolutely no originality in melody, harmony, rhythm, or instrumentation. It consists of six parts, the last of which is called a "Lullaby"—a proper title for the whole work. It is difficult to see why it should have been performed except as a matter of international courtesy, or in order to show how much the admirable Philharmonic orchestra can accomplish with the scantiest material. The Serenade was followed by Beethoven's second "Leonora" overture, one of those preliminary sketches of the third "Leonora," which is the greatest overture written before Wagner, and of which Schumann once remarked that there is more "future" in it than in Beethoven's symphonies. The second lacks in some respects the finish and concentration of the third, but to a connoisseur it has some of those special charms of a sketch which depend on the white heat of inspiration, and which a finished picture sometimes lacks. As a composition it unites the greatest delicacy to be found in Beethoven with the utmost vigor and grandeur. Those abrupt chords, followed by repeated terrible pauses, must have been in Wagner's mind when he said that in Beethoven everything is melody, even the pauses. In the Bach concerto for string orchestra which followed this overture many of the hearers probably failed to discover any melody at all. It requires a sustained intellectual effort to follow the complicated evolutions and combinations of such a score; but to those who are able to make such an effort the reward comes in the shape of intense pleasure.

—After the Beethoven and Bach selections, it might have appeared impossible to attain a further climax of combined beauty and grandeur; but it was attained in Rubinstein's great Dramatic Symphony, which we feel tempted to place at the head of all works of its class. In this work, which is less popular but more valuable than the "Ocean" Symphony, Rubinstein rises to the highest level of modern musical thought. In certain details of instrumentation, harmony, and dramatic vigor the influence of Wagner is visible; but otherwise the work is such as only the inspired Russian could have written. It is extraordinarily rich in suggestive ideas, and the elaboration of them often follows the modern principle of progression through various keys with ever-increasing intensity and vigor. The first movement is very long, but there is not one superfluous note. The scherzo is perhaps the finest symphonic movement in existence, a composition that haunts the memory for weeks. The adagio is full of the noblest melody, while the last movement, with its intoxicating rhythmic swing, reminds one of Rubinstein's ballet music. This is not intended as adverse criticism, because the symphonic form itself is nothing but the "apotheosis of dance music." The Philharmonic orchestra has played this symphony under the direction of the composer, but Rubinstein himself could not have given it with more technical finish, delicacy, passion, and abandon than Mr. Thomas. The performance, in fact, was so grand and absolutely perfect that one forgot that there was an orchestra or a conductor, and became completely absorbed in the progress of the music.

THE VILLAGE COMMUNITY.

The English Village Community, examined in its relations to the manorial and tribal systems, and to the common or open-field system of husbandry. An essay in economic history, by Frederic Seebohm. London: Longmans, Green & Co. 1883. 8vo, pp. 464.

The Early History of Land-holding among the Germans. By Denman W. Ross, Ph.D. Boston: Soule & Bugbee. 1883. 8vo, pp. 274.

THE two books whose titles are given above mark an important step in the investigation of early institutions and the early history of property. In one sense they are controversial and aggressive, inasmuch as they differ positively from the Village-Community theory as it has become familiar to us from the writings of Sir Henry Maine, Professor Nasse, Mr. Morier, and others. In another point of view, however, they may be regarded rather as taking up the discussion at the point to which it has been carried by these writers, and continuing it in a different direction and to different conclusions. The labor that has been employed in developing the theory of Village Communities has not been thrown away, even if we should be forced to admit that the theory itself is not true. The facts from which it was deduced still remain; the writers before us have only proposed a different explanation of them. And in any case, whether we accept their explanation or not, we owe to them a positive and valuable contribution to the discussion.

The theory of Village Communities is that the present régime of individual ownership of land was preceded by a system of collective ownership, in which the territory of a village was the common property of the freemen of the village—no individual having any land of his own, but each occupying a portion assigned him for temporary use; the cultivation of the whole being under common rules and regulations. Ownership in severalty, according to this theory, came into existence by gradual steps, occupying probably a long period of time. It is not claimed that the village community, as thus defined, was the only form of social organization at the period in question (*e. g.*, among the Germanic nations at the time of the migrations), but that it was the prevalent one; and the conversion of the free village, or township, into the manor, or lordship, has been understood to be one of the most important steps in the development of the Feudal System. The theory as worked out by Von Maurer, its leading German advocate, pays comparatively little attention to the origin of the institution, but is devoted mainly to its organization and history. Its origin, in the settlement of a family group upon a definite area of land, is noticed, but passed over rapidly, receiving, as might be expected, rather more attention from the leading English exponent of the theory, Sir Henry Maine. It is obvious, however, that when the theory is put upon the defensive, the question of its origin—whether a matter of historical evidence or of conjecture—becomes of the first importance.

We suppose it is generally admitted that the earliest organization of society was by family groups, and generally admitted that the earliest occupation of land was by these same family groups. Theoretically, therefore, the beginning of property in land would be on the part of the family group—the household, the gens,

MALDEN PUBLIC LIBRARY

the tribe. Any discussion of the history of landed property must, therefore, be in harmony with the facts of the tribal structure of society and the occupation of land by family groups. It is a strong point in Mr. Seebohm's treatment of the subject, that he does full justice to this side of it; it is one of the most interesting and valuable features of his work. Mr. Ross, on the other hand, approaches the subject from the point of view of individual settlement and ownership. He does not reject the tribal structure of early society, although in note 69, page 175, he suggests some doubts as to its universality; but he builds up his argument wholly without reference to it. Starting with the assertion (page 1) that the German freemen "settled neither in villages nor in towns, but in isolated farmsteads," he brings up an amount of evidence, from laws, charters, etc.—which, in the face of the Village Community theory, is truly startling—in favor of absolute individual ownership of land among the Germanic nations at and after the period of the migrations. The only answer that can be made to this array of evidence is that laws and charters do not present a complete picture of the life of a people. The Village-Community theory must stand, if it stands at all, upon other testimony, which shall prove the existence of collective property by the side of individual ownership. The documents *of this period* afford it very little support.

We have said that what the two writers before us have done is to give a different interpretation to the facts collected by Von Maurer and others. *Village communities* they admit to have existed, but the *Village-Community theory* they deny. Mr. Seebohm sets out with a description of the English Village Community, which occupies nearly two hundred pages, and is the most exhaustive and lucid account of this system that has ever been made. Beginning with his own manor of Hitchin in the nineteenth century, he traces the institution step by step back to the period of the Saxon conquest, with such fulness of detail, and with the assistance of such instructive plans and illustrations, that the reader finds it easy to get a clear and accurate notion of it. Now, the institution thus minutely analyzed is the institution described in general terms by Sir Henry Maine. Mr. Seebohm is, therefore, treating of the same institution as his opponents, and he describes it much more completely than they have ever done. Where, then, does he differ from them? In respect to its origin. The generally-accepted theory assumes that a free village community was converted into a serf community in the process of feudalization. Mr. Seebohm and Mr. Ross argue that no such conversion ever took place; that it was always a community of serfs. It was, they say, a community of serfs in the Middle Ages, and no one can point out, *by any direct and cogent evidence*, the time and the process of its becoming serf, having before been free. Nay, Mr. Seebohm goes further, and shows by overpowering evidence that the English village community was a servile community at every one of the stages by which he traces it back from the latter part of the Middle Ages to the sixth and seventh centuries. We cannot see any flaw in his evidence, and are obliged to concede, as we did in the case of Mr. Ross's evidence, that if the theory of the free community is to stand at all, for England, it must be by evidence, which has not yet been forthcoming, for its having existed by the side of the serf community. Evidence which has not yet been forthcoming, we say, but which there are reasons for thinking not improbable.

This view, that the village community always was a community of serfs, flies directly, as will be seen, in the face of the accepted theory of the primitive democracy of the Germanic nations. The writers before us do not hesitate to accept this conclusion, and to argue that the original German constitution was not democratic, but aristocratic. They explain the passage in the sixteenth chapter of Tacitus's 'Germania,' which describes the habitations of the Germans, by assuming that the free tribesmen lived in isolated homesteads, and their serfs and dependents in villages near their lord's house—precisely like the negro quarter on a Southern plantation. This interpretation is certainly plausible, and, taken by itself, would perhaps be the most satisfactory way of explaining the passage in question. On the whole, however, the descriptions of the German institutions in Cæsar and Tacitus, as well as in later documents, scanty as they are, appear to us clearly to establish a prevailing democratic society. Again, no room is left for the "common freemen," who, it is certain, were not reduced to complete serfdom earlier than the ninth century. But, on the other hand, the theory of village communities leaves no room for the natural aristocracy of tribal society—the *nobiles* and *proceres* of Tacitus. It assumes that when the village community was developed out of the family community, each group consisted of completely democratic elements, and that the aristocracy, the lords of manors, grew up *after this time*. But what we should rather infer from the language of Tacitus is that an aristocracy had grown up by the side of the democracy, while still in the tribal stage: a body of rich nobles, with no political privileges, but with the natural influence of wealth and station. From these the magistrates would naturally be taken; about these were grouped the retainers or personal followers; these had the largest share of land and the most serfs. But by their side the great mass of common freemen still continued organized in family groups, occupying common tracts of land, composing the rank and file of the army, and, in the national and district assemblies, exercising the national sovereignty. The books before us exaggerate the aristocratic element in the Germanic constitution, but the opposite theory undervalues it.

We have said that Mr. Seebohm does full justice to the tribal features of early society. We are inclined to think that his most important contribution to historical science in this book is in working out the two lines of development in tribal arrangements—the Welsh and the German (see p. 345). The chapters upon the Welsh, Irish, and Scotch tribal organization and economical system are not inferior in interest and originality to those which treat of the English system; they are less complete, because there are not materials for so elaborate a discussion. We have not space to discuss, even if we felt ready to do so, the theory proposed as to the origin of the English open-field system, which is attributed to Roman rather than German influence, finding its completest analogy in those parts of southern Germany which, like Britain, formed a part of the Roman Empire. The theory is too startling to be accepted off hand, and the arguments are, at the same time, too strong to be rejected summarily. We will only suggest that we do not see clearly why, if it was of Roman origin, other parts of the Roman Empire besides the Rhætian province should not have furnished an analogy. Moreover, we understand the Roman *villa* to have lacked that most essential feature of the manor—the division into demesne and tenement lands, with the reciprocal relation of the two. The mediæval serf paid for his land with labor upon his lord's demesne; the *colonus* of the Roman Empire, represented by the modern *métayer*, received lands which he worked on his own account, rendering to his lord a certain proportion of their products. The two types of serfdom were wholly different, and the estates on which they respectively existed were correspondingly different. The question arises, then, how came a form of serfdom and of manorial estate to prevail in Rhætia and Britain so fundamentally different from what was found in the rest of the Empire? Another fact which appears not to have been taken into account by the authors of this theory, is the existence of free village communities in the Middle Ages. We suppose that in England, in which the process of feudalization was complete and without exception, there were none of these; but in some parts of Germany, if Von Maurer is correct, they were numerous. So far, therefore, as the argument rests upon the absence of proof that free communities became servile by feudalization, it is perhaps balanced by the difficulty of showing, under their theory, how these free communities came into existence.

In conclusion we will say that both our authors make concessions which possibly point to the true method of reconciling the difficulties of the problem. Mr. Ross, after beginning society with isolated homesteads, shows (p. 27) how clan villages might grow out of these; while Mr. Seebohm says (p. 367): "It is certainly possible that during a short period, especially if they held no serfs or slaves, tribal households may have expanded into free village communities." "A short period": the Village-Community theory says it was a long period—centuries, perhaps. The two theories are not, then, so far apart as seems at first sight.

Poems in Prose. By Ivan Tourguéneff. Boston: Cupples, Upham & Co.

THESE poems by Turgeneff, like almost all that he has written, come to us only at second-hand. They have been translated from a German version, and some internal evidence suggests that the portion of them which has appeared in *Macmillan's Magazine* is from the same source. The translation is most imperfect and inadequate, but it is fair to suppose that the German text has been followed, so that what we have to say is not meant for criticism of the English, but to show a little what Turgeneff did not write.

There is, of course, in this book nothing as to the history of the poems, as that has appeared only since the author's death. When his friend, the editor of the *Messenger of Europe*, was visiting him at Bougival, some eighteen months ago, Turgeneff showed him a quantity of manuscript, on bits of paper of all shapes and colors. "These are my sketches," he said, "my studies from nature, from which, like a painter, I make my large picture. If I do not use them they shall go to you for safe keeping after my death." His friend represented that that was only to make the public desire his death. Turgeneff replied that most of them were "too personal, too intimate" for publication for many years yet; but, upon some further urging, he consented to look them over, and shortly after sent to the editor a selection of fifty which he had finished and written out with his own hand. He himself chose as title, 'Senilia.' "An Old Man's Fancies," in *Macmillan's*, is a pure fabrication. In a brief note to the reader, Turgeneff begged him not to take these "poems in prose" all in a heap, but one by one. Hence the present title. They are allegories, parables, epigrams, each and all. If a likeness between them is sought, the most will fall into two groups, one of which describes the immense relentless power of Nature, and man's helpless nothingness before it; the other, the ever-present sense of death in life, and man's recoil from it, his struggle with it. They sug-

gest Heine, but there are heights and depths which the German never knew, and, be they never so sad, there is always sweetness in them.

No English yet has done justice to the perfect art of Turgeneff's style. Every word is the simplest, and there is never one too many, so that all the accuracy of a scholar and all the imagination of a poet are needed to reproduce it. A criticism which must be in the main verbal is like objecting to small atoms in a mosaic, but form and color both depend upon the atoms. In the translation before us the form is distorted, the color spoiled, by constant exaggeration, by attempts at "fine writing." "Our great singer" becomes "our sublimest." "Comes the wished-for moment—light scatters darkness," is made "Apollo rises—conqueror of night." Of the titles alone, "The Two Rich Men" becomes "Who is the Richer?" and "The End of the World" "The Destruction of the World." "Egoist" is confounded with "egotist." One bit of description of the peasants in church reads in the original, word for word: "They begin to bow, to kneel, to rise again, like ripe wheat when a light wind blows a slow wave over it." It is rendered here: "They moved up and down in a wave-like motion, rising and falling like ripe ears of wheat when tossing in the summer wind." The poem entitled "The Nymphs" has suffered very much, while "The Old Woman," with all the shiver there still is in it, is tame when compared with the startled horror of the original. The single rendering, "but no longer blind," which ought to be "but she sees!" is proof enough. In the last illness, in a moment of respite, Turgeneff told his friend that the hallucinations, the phantoms which came to vex his brain were like this "old woman."

We find another example in the dramatic sketches. Two destitute old souls befriend an orphan. "'We will take Katie,' said the old woman; 'the last of our coppers shall go to her, even though there be no salt to salt the broth.' 'Yes, we, her, and no salt,' answered the peasant, her husband." This is made: "'It will cost us our last penny; we shan't be able even to afford salt to salt our soup with.' 'Well, then, we will eat it unsalted,' said," etc.

There are mistakes that are more than careless. The conclusion of "The Blockhead," the point of the whole, is wanting. "Masha," which is of all the most pathetic, and which Turgeneff himself chose, with "The Village," to read first to his friend, is made ridiculous by the mistake of eight *years* for eight *months*. The *Macmillan* version has a mistake quite as extraordinary. The young Jaffier is offered wisdom, riches, or the power to please old women. To the wonder of the reader, he chooses the last; but then he asks, "Where lives the honored mother of our divinely-blessed Caliph?" The *Magazine* prints "Chalise" for Caliph, which makes worse than nonsense.

Turgeneff never pointed a moral. He was never a partisan. He drew the life and let it stand. But see how the translation misrepresents him. The Sphinx lives again to him in the faces of the Russian peasants. He calls them the heart (the kernel) of Russia. (That is left out.) To read the riddle of this Sphinx, "it is not enough to put on a cap." The translator has made him say "to put on the cap of a Slavophil.' From "What Shall I Think of?" the second half is gone, leaving an unintelligible fragment. Yet of them all, not one, in these early days after the death of the author, is so impressive. We give a translation of it, from the Russian, which claims no merit but its literalness. Reading it, one can but remember how the reality did come to the questioner. There was great suffering, then hours of unconsciousness to the end. His friend, the editor, wrote after his death, "He never in life was so beautiful—one might even say so grand; the traces of suffering, still visible the first day, on the next entirely disappeared, and the face had a look of deep thoughtfulness, . . . that face always sweet, always ready with a kindly smile. Only the dead-white color of the cheeks, the marble stillness of the features, spoke of death."

"What shall I think of when it comes to me to die—if, indeed, I am then in a condition to think?

"Shall I think of this—that I have made a poor use of my life, that I have slept it away, dreamed it away, that I knew not how to enjoy its gifts?

"How? This already death? So soon? Impossible! When I have not succeeded in doing anything—I have only gathered things to do!

"Shall I remember the past, shall I linger in the thought of the few bright moments of my existence, of dear forms and faces?

"Will memory bring up my foolish deeds—and will there come upon my soul the burning agony of a too-late repentance?

"Shall I think of that which awaits me beyond the grave—if there awaits me there anything?

"No—it seems to me I shall try not to think, but fix upon some trifle in order to take my own attention away from the gloomy darkness, blackening before me.

"In my presence a dying man kept complaining that they would not give him nuts to eat, and even then, in the depth of his glazing eyes, there stirred and quivered something like the fluttering wing of a mortally wounded bird."

Appletons' Guide to Mexico; including a chapter on Guatemala, and a complete English-Spanish Vocabulary. By Alfred R. Conkling, LL.B., Ph.B. D. Appleton & Co. 1884.

Few books proposing to meet a "long-felt want" come so near doing it as this one. It merits high praise. Mr. Conkling has kept closely to his purpose, and has given us very nearly a model 'Guide'—certainly has produced incomparably the best work on his subject. A large part of what he writes bears the unmistakable mark of personal experience. Not even Thackeray's fancied collector of third-class information for the omniscient Murray, the devoted being who always went to the "Lion Noir" or the "Cochon Noir," could have been more heroically self-sacrificing than Mr. Conkling has shown himself in finding out the truth about the discomforts of the poor hotels and poorer fare of that land which still, as in the days of Mr. Birdofredom Sawin, "is swarmin' with the most alarmin' kind of varmin." The book is so good, so probably destined to be the authority for some time to come, that it is well worth while to point out the minor errors which we have noted.

The Spanish of the volume is remarkably accurate for a book that uses so much of it. The commonest fault is the omission of the accent. It is wanting in "vomito" (pp. 3, 152) (Hosea Biglow's true ear made it rhyme with "le' *go* my toe"), "sacristia" (p. 73), "publico" (p. 165), "pulquerias" (p. 194), "vayase" (p. 360), "cerveceria" (p. 361), "huesped" (p. 367), and "lapiz" (p. 371). Misprinted words are "cuartillo" (p. 61), "sillaria" (also lacking an accent) (p. 72), "traige" (pp. 352, 358), "de(s)pacio" (p. 356), and "ahorras" (p. 359). We fear that the confiding tourist who should follow the directions of the 'Guide' in asking for hard-boiled eggs, in any Mexican restaurant, by calling for "huevos pasados en [better, por] agua" (p. 52), would be sadly disappointed. The expression cited is the universal one for the softest of soft-boiled eggs. In like manner one ought not to think that he would get anything like our "soup" by demanding "sopa" (p. 52). The waiter would bring dry boiled rice, variously seasoned. Following Mr. Conkling, the traveller might not get a taste of the luscious apricots which flood the markets in May and June if he only asked for "albaricoques" (p. 358). That is good Castilian for the fruit, but the Mexican market-woman knows it only as "chabacano." In fact, the principal defect of the "English-Spanish Vocabulary" is that it does not clearly enough discriminate the Mexican from the Castilian. The slight differences in pronunciation pointed out (p. 345) are not so important as the differences in usage. These, for the most part, are overlooked. We do not know what could have been meant by saying "the 'd' is not sounded in the middle of a word" (p. 345). It does not have its English sound when between two vowels, but it is always sounded. The sound of some of the other letters is incompletely or incorrectly stated on p. 346. The failure to give the gender of the nouns in the Vocabulary seems to us an unnecessary encouragement to the use of monosyllabic, ungrammatical Spanish, such as is so painfully common in the mouths of American travellers in Mexico; but perhaps those who would confine their linguistic studies to a 'Guide' are not likely to aim at anything higher. Similarly, the omission of the inverted question-marks (p. 351) violates the laws of written Spanish, but that would not greatly inconvenience the mere tourist.

Mr. Conkling ascribes to Popocatepetl the honor of being "the culminating point of North America" (p. 26), though he is aware of the rival claim of St. Elias (p. 299, note). The latest measurements, however, give the palm to the Alaskan mountain. This reminds us of the ridiculous character of some of the pictures of mountains which the 'Guide' offers for our admiration. They look like a child's first attempt to draw a mountain, what with their impossible slopes and smoking peaks—these last in the face of the assertion that "no eruption has occurred in any of them during the present century" (p. 84). Indeed, the illustrations of the book are inferior. Some of them appear to have been printed from old plates, and are no longer truthful. Thus, the Plaza of Mexico City has not had the appearance given it on p. 183 since 1877. The author cautiously states (p. 50) that "there is not a single fireplace in any building in Mexico." We know of several. We are curious to know how the "real" (12½ cents) can be the "basis of the decimal system of coinage" which, it is said (p. 61), "Mexico has followed the example of Spain in adopting." The truth is, the decimal system *has* been adopted, and the Government now coins only in accordance with it, while all the denominations mentioned by Mr. Conkling, except the "peso," are simply the remnants of the old system brought in by Spain. The old coins still circulate, and are in great favor with the people, but they are no more a part of the decimal system than they are of the solar system. The otherwise full and admirable information as to the banking facilities of the country is inexact in the statement (p. 62) that only the bills of the Monte de Piedad circulate at par outside of the city of Mexico. It should have been added that the Banco Nacional has a "sucursal" in all of the leading cities, where, of course, the bills of that institution are as good as silver. If Mr. Conkling were in the habit of receiving letters from Mexico, he would not have said that the postage on foreign letters was five cents (p. 65). The Postal-Union schedule calls for that rate, of course, but it is on a gold basis; and it suddenly occurred to the Mexican Government, in 1882, that five cents in gold equalled six cents in their depreciated currency, and accordingly they have sold six-cent stamps since the date mentioned.

The account of Weights and Measures (p. 103 *et seq.*) is not altogether happy. It is truthfully stated that the metric system is now the only legal system, but it is far too much to say that

it is in the rural districts alone that the old system prevails. It is one of the proofs of the inefficiency of the Mexican Government that it has not been able to make the metric system universal even in the Federal capital. It is thus a defect of some gravity that Mr. Conkling gives of native measures only the linear, omitting entirely the cubic, and says nothing of native weights. The singular mistake appears to have been made of confounding the days when the national flag is displayed with the great *dias de fiesta*. Sometimes the two coincide; but the religious festivals are far from having fallen into neglect, as the 'Guide' infers (p. 124). Save the 5th of May and the 16th of September, the church feast days are altogether the most widely and enthusiastically observed. This suggests a word in reference to the entirely inadequate account which is given of Protestant Missions. They are said (p. 134) to have been founded in five cities. As a matter of fact they are established in fifteen cities besides those mentioned by Mr. Conkling, to say nothing of many country outstations. It seems to be implied on p. 182 that the only way of getting water, in the city, is to buy of the "aguadores," who distribute from centrally located fountains. This is often done, but many of the houses have pipes leading up to the roofs to feed private tanks, from which the house is supplied much as with us. Of course, the water has not head enough to reach the level of the roof, and has to be pumped up. This necessitates the "bombador," who, with the "aguador," does what he can to make up for those inconveniences and annoyances which are supplied to us by the plumber.

But these are small spots on the general excellence of this new 'Guide.' For accuracy of information, for comprehensive acquaintance with the present routes of travel and with the places of chief interest, for absence of padding and mere sentiment, we know of no English work which approaches it. It deserves unhesitating commendation. It is worthy of its name. It will be a safe guide to those who trust it. Many of Mr. Conkling's observations on the Indian population are both shrewd and just. He seems to us to be wrong, however, in saying that, as a class, the Indians are long-lived. If they were it would be astonishing, when we remember that most of them have a diseased blood to start with, and get only the wretchedest fare with the severest toil. Yet, it is true, in their prime they do exhibit wonderful feats of strength and endurance. We are told (p. 225) of an Indian keeping up with a horse for thirty-one miles, covering the distance in seven hours. The writer of this review will not soon forget the hardest day's ride of his life, sixty miles over frightful roads, through bottomless *barrancas*, requiring twelve hours in the saddle. Yet our oriflamme was the red *serape* of our Indian guide, a splendid giant, who jauntily trotted ahead of us all the way and came in the freshest of the party, man or horse. One could believe in the Montezuma fish-story after that.

Gems of Chinese Literature. By Herbert A. Giles. London: Bernard Quaritch; Shanghai: Kelly & Walsh. 1883.

THIS volume is designed to afford an insight into the general literature of China, which, according to the author, is still "virgin soil, and remains to be efficiently explored." No doubt this is the case; for, although we have 'The Middle Kingdom' and Wylie's 'Notes,' not to mention the "desultory notes" of Thomas Taylor Meadows, yet in none of these do we find translations of native literature, arranged as they are in the volume before us. Mr. Giles gives a sort of piquancy to his undertaking by reminding his English readers that while "their painted forefathers were running naked and houseless in the woods, and living on berries and raw meat," the inhabitants of the great empire of China held learning in high esteem. This of course is curious, but it tends to show that such learning may be unproductive of practical results; for, after all, the Chinese people, in their wedded fondness for antiquity, are the least progressive in the world. And this is the secret of the sometimes ridiculous light in which they are placed by our book writers and travellers. That they are capable of keen practical work as individuals is plain enough by what we see among ourselves; but as an empire they have been, until very recently, at a standstill for ages.

Mr. Giles takes us up to the fountain-head by showing us something of the learning of the "Socrates of China," K'ung Fu-Tzŭ (Confucius). He was an editor rather than an author. His sayings, like those of the wise men of Greece, are sometimes striking, but we wonder they have done so little good; for, as to practical results, we search in vain. What has the doctrine of "reciprocity," for instance, done for the people? Mr. Giles lays stress on this, as though it amounted in value to the golden rule of Christ; but has it ever borne fruit? Mr. Mayers is not far wrong, we think, in calling it all "simple materialism."

Confucius is brought before us in a new light, however, in some of the extracts given by Mr. Giles. There is something comical in the piece called the "Song of the Coffin" (p. 43). Confucius went to help an old friend varnish a coffin; the coffin was for his friend's mother, deceased. "Ai-yah!" exclaimed the friend, as he brought the coffin in, "'tis long since I have had any music." Thereupon he began to sing:

> "Striped like the wildcat's head,
> Smooth as a maiden's hand,
> Ai-yah! Ai-yah!"

—the first line referring to the grain of the wood, the second to the character of the varnish. Here we have a specimen of materialism, pure and simple. Confucius pretended not to hear, but he did not disapprove: "Besides the duties we owe to parents," he said, "there are those we owe to friends." Mr. Giles speaks of the "inspiration" of Confucius, which "has placed him in the front rank of the world's prophets" (p. 46). A prophet, in the sense of teacher, he may have been; but a prophet or teacher for "the world" he never has been nor can be, for he entirely lacks the enthusiasm of humanity. He is, emphatically, "a Chinaman of the Chinese."

There are pleasant passages for reading and amusement scattered through this book, as we turn its pages. "The chaste wife's reply," on p. 111, is humorous and well turned. She refuses, as in duty bound, the two pearls sent her by an admirer, but regrets, withal, that she did not meet him in earlier years:

> "With thy two pearls I send thee back two tears:
> Tears—that we did not meet in earlier years!"

—a naïve confession, and essentially Chinese. Admirable is the devotion of Han Wĕn Kung, "the prince of literature," in preferring exile to the neglect of what he thought his duty. In fact, this is the chief point of attraction in the character of Chinese official life—the outspoken boldness of the censorate. This man, for instance, denounced Buddhism, which he regarded as an offensive idolatry, "the worship of a decayed bone"; and in consequence he was exiled to the barbarous South. He was ultimately recalled and loaded with honors, and was, after his death, canonized; and his example has done much to perpetuate the virtue of honesty in official life, for which, with all its faults, China is still conspicuous.

The strange expedient of Chang Yüeh, who, when "afflicted with gout, and unable to put foot to ground," forwarded two goats to the Imperial park, that people might see how they could fight, and so imbibe a like warlike spirit, gives us further insight into the character of this strange people. We are told, in connection with this incident, that the Prince of Ch'u, when going to war, stopped on his way to bow to a frog—a traditionally brave creature—"in order that his soldiers might infer how much more he would be likely to honor them for bravery on the field." We sincerely hope they were not disappointed, but it was a strange device; at any rate, it shows us that the Prince of Ch'u gave his soldiers credit for considerable power of inference. This same Chang Yüeh who was afflicted with gout, seems to have applauded the worship of Buddha as much as his successor, Han Wĕn Kung, denounced it; for we find that it was he who wrote the mysteriously worded preface to the travels of the Buddhist pilgrim, Hiuen Tsiang, in which his admiration for Buddhism is only less conspicuous than his fulsome laudation of the Emperor.

It is impossible to go further into the contents of this little volume. It will do much to accomplish the purpose which its author had in view, viz.: to exhibit, at first hand, the character of the Chinese people. Up to the present time, at least, they have been a riddle and a by-word in the Western world. Perhaps they are not destined always to remain so.

Geology of Wisconsin. Vols. I and IV. T. C. Chamberlin, Chief Geologist. Madison.

WHEN Mr. Chamberlin set himself the task of producing a volume which should serve as a text-book in the schools of his State, be intelligible and attractive to the non-scientific reader, and still possess interest for his scientific compeers, he undertook a work which a less skilful writer would have done well to avoid. The result, in point of literary execution, leaves little to be desired. There is a gratifying absence both of the stereotyped marks of a text-book, and of those florid passages which disfigure too much popular scientific literature. It is not unlikely that some parts may prove rather heavy for the young student, and, unless he is fortunate in having a more efficient teacher of geology than most of our schools afford, he may not always be able to follow the author's terse reasoning. Such parts, however, are rare, and generally unimportant. From another point of view the volume is open to criticism. The practice of incorporating botanical and zoölogical data in geological reports has the sanction of custom, but the propriety of the combination may be seriously questioned. Of the 235 pp. of biological material, one chapter, pp. 441 610, on the Economic Relations of Wisconsin Birds, deserves mention. In order to determine the beneficial or detrimental character of the different species, from an economic point of view, Mr. F. H. King has examined the stomachs of a large number (1,608) of birds. While in the case of many, perhaps of most, species the number of individuals studied has been too small to warrant authoritative conclusions, the results are still of value and interest. To make an investigation of this character complete, it would, of course, be necessary to ascertain the average character of the food of each species throughout the year, in the regions through which it migrates, as well as those in which it breeds.

In a chapter prefatory to the geological sketch which constitutes the first 300 pp. of the book, Mr. Chamberlin proposes a system of lithological nomenclature, the adoption of which is urged

upon the claim of mnemonic simplicity. A single illustration will give the clue to the main feature of the scheme. To recognize a given rock as granite, the student must be able to recognize the constituent minerals severally, and then to learn that the combination is *granite*, a term which gives no hint of mineralogical composition. This system proposes that instead of granite the rock be designated by a name made up of abbreviations of the names of the constituent minerals. The combination of quartz, feldspar, and mica would be not granite, but qua fel-mi. Moreover, the term now in use gives no indication of the relative abundance of the several minerals. It is proposed, under the new system, that the abbreviations be arranged in the order of the relative abundance of the constituent minerals. Thus, granite may be qua-fel-mi, fel-qua-mi, fel-mi-qua, etc. If it is desired to designate which mica and which feldspar are present, the abbreviations for the specific names of the given mica and feldspar may be substituted for those of the general names, as qu'orth-mus (quartz, orthoclase, muscovite). When accessory minerals are present in number, the combinations, if including them, would doubtless become cumbersome, but rarely as much so, the author declares, as many terms in the chemical nomenclature of the day. It is not easy to see how this proposed system can do any good, or do anything, if attempted, but increase the difficulties of nomenclature. If granite, which refers to texture, is not a good name, mica is no better; and radical reformers would soon wish to replace the familiar names of common minerals by others suggestive of chemical constitution. The system here proposed cannot help the non-scientific; and scientists can hardly consider it without a smile. Its introduction would certainly be both difficult and useless.

The Laurentian and Huronian ages, which represent "more than one-half the sedimentation of geological history," receive relatively much fuller treatment than is commonly accorded them. The copper-bearing rocks are classified as representative of a distinct period (Keweenawan) of the Huronian age. This is a point which has already provoked much spirited discussion, and the position of the Wisconsin geologists (Irving and Chamberlin) has been and still is assailed by a number of geologists less familiar with the ground. In the consideration of the palæozoic and subsequent ages, there is necessarily little that is new. Facts are uniformly presented from a causal standpoint, and in a manner intended to stimulate thought. Prominence is given to fundamental principles, as erosion, sedimentation, etc., and there is scarcely an activity operative in geological history which does not, directly or indirectly, receive consideration, and this always in connection with the effects of which it is the sole or joint cause. This is, with beginners, a point of vital importance, and in this respect the present sketch has no superior in the text-book literature on geology. Life history is not slighted, and incidentally some suggestions are made which seem to indicate that the author is not in perfect harmony with current theories of evolution.

It is when the author takes up the quaternary period (pp. 261–300) that he appears at his best. Wisconsin affords exceptional opportunities for studying quaternary geology, embracing as it does a driftless area, an area of drift of the earlier glacial epoch, and another affected by the drift of the later glacial epoch. Such contiguous areas are invaluable for accurate determination, and from this region the more critical parts of our present knowledge concerning glacial history in America have been derived. Mr. Chamberlin was the first to determine the moraine character of the "kettle range" of eastern Wisconsin, and to demonstrate by data from the same region the character of the ice-movement during the glacial period. He was also the first to correlate the moraine of Wisconsin with that previously traced in New Jersey and Long Island, and to hypothecate the connection between the two which he has since proved to exist, and to announce the theory that this consecutive moraine, or series of moraines, is proof of a second glacial epoch, and marks the limit of ice action at that time. Among the collateral topics of popular and professional interest is that of the origin of the great lake basins. These are regarded as the joint product of preglacial erosion, glacial erosion, and depression caused by the relatively-excessive weight of ice over these areas, which were, it is maintained, demonstrably the paths of gigantic ice-lobes. The argument against the preglacial origin of these basins (pp. 252–9) is as cogent a line of reasoning as is often encountered. A psychozoic era is recognized, on the ground that "man more powerfully affects the course of geological progress" than did any other form of life, as mammals, reptiles, etc., whose advent or dominance marks the separation of geological ages. The increased erosion, and consequently transportation and sedimentation, incident to cultivation, together with the attendant effects upon the life of streams and coasts, are among the geological influences which man has introduced. Other noteworthy discussions in volume i. are to be found on pp. 53–9—character of the primitive crust; and on pp. 206–12—generalizations on the palæozoic series—as well as the final chapters, which possess an economic interest. Among these is an exhaustive discussion of artesian wells, which sets forth the principles concerned, the conditions of success, and the possibilities of failure in favorable localities.

The discussions concerning the ore deposits (copper, vol. i., pp. 108–15; lead and zinc, vol. iv., pp. 365–571) will attract wide attention, both because of the inherently interesting nature of the subject, and because such conflicting and unsatisfactory theories have heretofore been advanced. With regard to the copper, the theories of oceanic precipitation and of igneous injection are quickly disposed of. The proximate source of the copper is regarded as "the igneous rocks themselves"; and "the more distant source, the rocks from whose melting these arose." This would account for the wide distribution of the metal, which by igneous agencies would be left disseminated throughout the rock. The concentration of the metal into the forms in which it now occurs "is believed to have been accomplished through the agency of permeating atmospheric waters." The ability of such waters, when charged with carbonic and organic acids, to dissolve mineral ingredients has been demonstrated. The only difficulty, therefore, is with the subsequent precipitation of the metal. This the author vaguely explains as due to the chemical reactions which would result from the commingling of variously-charged waters in the "avenues of internal drainage," viz.: the fissures and porous portions of the formation. That the waters which penetrate the rock would seek the fissures, amygdaloidal portions of the formation, and the porous interstratified detrital beds, there is no doubt. That chemical changes would result is highly probable. But just how metallic copper would emerge from this obscure laboratory, we are not told.

The treatise on the lead and zinc deposits is satisfactorily full, and covers a wide scope. Elaborate details concerning the occurrence of these ores, their vertical and areal distribution, their position in strata, their relation to topographical features, the relations of the several ores to each other and to associated minerals, and the changes which each has undergone since deposition, are given in an apparently impartial manner. Indeed, it is impossible to gather from the presentation of these details even the remotest clue to the author's views. These data precede the discussion concerning the origin of the ores and the exposition of the author's ingenious theory, so that the reader has the exact situation well in mind before he is led upon the uncertain ground of theory. The approved hypothesis is a modification, or perhaps rather a completion, of Prof. Whitney's theory advanced some years since. With him the ores are believed to be of oceanic origin. The archæan rocks are maintained to have been the more distant source, and from them the metals in question were extracted by drainage waters. These propositions, however, in no way account for the localization of the ores, and for this important part of the present theory Mr. Chamberlin is, we believe, alone responsible. The localization, it is urged, was due to the combined agency of oceanic currents and organic matter. The course of oceanic currents is dependent upon the relative position of land and water, and the direction of prevailing winds. Sufficient reasons are adduced for believing the ores to have been extracted from the ocean during the Trenton period; and from the known position of land at that time, and the probable direction (the same as now) of prevailing winds, it is calculated that currents would result which would bear the major part of the drainage from the archæan highlands to the region where the ore deposits occur. To comprehend clearly the author's views, reference should be made to the map of silurian currents, p. 531. The mineral solutions being thus brought to the required locality, it only remains to account for the extraction of their metallic content. Seaweed is capable of taking the lead and zinc, as well as other metals, directly from sea-water, and that seaweed was present in quantity, the rocks give conclusive evidence. Further, the region in question is marked by a series of mounds and depressions, and it is with the latter that the ores are found uniformly associated. In a shallow sea (and the Trenton sea was here demonstrably not deep) the depressions of an uneven bottom would be the localities most favorable for organic growth; and into the depressions, as places of relative quiet, lifeless and drifting organic matter would be likely to be gathered by the movements of the waters, and would here undergo decomposition. Some of the decomposition gases—notably hydrogen sulphide—are well-known precipitants of metals in solution, and, upon being generated, would throw down the lead and zinc as sulphides. The strata would thus become locally impregnated with these ores.

The concentration of the ores in the crevices as now found is ascribed to the action of percolating waters. These, with their oxidizing impurities, would change the insoluble sulphides to soluble sulphates, which, unchanged or more likely as carbonates, would be borne onward to the main channels of drainage—the crevices and openings in the strata. Here, mingling with the waters descending more directly from the surface along the fissures, and bearing more or less unoxidized organic matter, the metals would be again reduced to the form of sulphides, and as such deposited. That the supposed organic matter was, in some cases at least, introduced into the crevices directly from above, is shown from the fact that bones have been found in crevices, sometimes with lead sulphide deposited within them. The exact character of the chemical changes is left somewhat indefinite, since the

precise effects of the organic impurities in the atmospheric waters are little understood. The process of concentration must have been one of extreme slowness, according to the theory, since the amount of mineral held in solution by the permeating water at any one time must have been infinitesimal. That the process was a slow one is evidenced by the large size of the crystals and the succession of layers, and there is no reason to suppose that it has yet ceased. The theory has the merit of being consistent with the facts, and of invoking the agency of no unknown force, or of known forces in unknown ways, and the monograph—for such it really is—will be looked upon as an important contribution to science.

The remaining portions of vol. iv. possess little popular interest. With one or two exceptions they are district reports. Professor Whitfield's report on palæontology, pp. 163–363, embraces descriptions of many old and of about thirty new species, and is accompanied by twenty-seven full-page lithographic plates, on which are figured upwards of 200 species. The report on the microscopical studies of the crystalline rocks of the Wisconsin Valley (Irving and Van Hise) is of value to specialists. Both volumes are fully illustrated and have copious indices, and vol. iv. is accompanied by an atlas of sixteen large maps.

An Old Philadelphian. Col. William Bradford, the Patriot Printer of 1776. Sketches of his Life, by John William Wallace. Philadelphia: Privately printed. 1883. 8vo, pp. 517.

Mr. Wallace has prepared an exhaustive and interesting account of the life of a man who well deserves the tribute thus paid to his patriotic services in the field, in literature, and in various avocations of his long, useful, and honored life. The third of the earliest American family of printers, William Bradford was a public-spirited citizen, and his memoir serves as an admirable account of the interesting period in which he was one of the prominent figures in Philadelphia, and that city was, in every sense, the capital of the country. The description of the Philadelphia of that day, and the details of the military and naval operations in the neighborhood during the Revolution, are an actual addition to our slender stock of knowledge on the subject.

The bibliographical value of Mr. Wallace's book is greatly heightened by his exhaustive catalogue of the Bradford imprints, so eagerly sought for by book collectors. William Bradford followed intelligently in the footsteps of his uncle and his grandfather, the first printer in the Middle States, and added to their merit that of being the publisher and editor of the first newspaper in the same region. The *Pennsylvania Journal*, begun by William Bradford in 1742, remained in the family for sixty years, and its business papers, carefully preserved with those of the whole family in their successive occupations, in the Historical Society of Pennsylvania, supply a very curious and hitherto unwritten chapter in the history of the newspapers of the country. The post-office and the newspaper grew up together, and each helped the other forward in advancing to their present condition. Franklin and Bradford have fared very differently in the popular estimate put upon their services in these, as in other broader fields of labor; but Mr. Wallace shows how large a share the latter had in the public improvement of his time. His services in calling into existence, administering, and putting on a sound basis the little Pennsylvania navy, for the protection of Philadelphia, ought not to be overlooked, for from that beginning grew the navy of the United States. As the founder of the Merchants' Exchange and of the oldest insurance company of Philadelphia, Bradford has still another distinction; but his *Journal* and his *American Magazine*, first issued in 1757, were the precursors of that periodical literature which, with all its faults, is one of the characteristic features of American intelligence.

Well printed and well illustrated, with portrait, maps, and other very attractive woodcuts and engravings, this volume is too full of matter of interest to be relegated to the narrow circle of the readers of one hundred presentation copies, to which this edition is limited. With all due respect to the bibliographer's love of rare books, it is only fair to such historical research that it should be brought home to the general public by the early issue of an edition large enough to meet a general demand.

Beowulf and the Fight at Finnsburh, with Text and Glossary. Edited by James A. Harrison and Robert Sharp. Boston: Ginn, Heath & Co. 1883.

The present volume is number one of a projected library of Anglo-Saxon poetry for American students. Being the first edition of 'Beowulf' ever printed on American soil, it deserves praise on that account, if on no other. But, irrespective of the merit of precedence, the edition has positive merits of its own. While the text is that of Heyne's edition of 1879, the glossary is somewhat fuller than Heyne's, and also more accurate. The editors have evidently bestowed great pains upon this part of the book. Even such of our readers as have already Heyne's edition will find it profitable to use the American glossary. We have not the space, of course, to consider the general status of 'Beowulf' in Anglo-Saxon literature, nor even to discuss the question—which has never yet been fairly met—whether the study of Anglo-Saxon is best promoted by a too exclusive attention to 'Beowulf.' Our individual belief is that a poem presenting such difficulties in text, language, and allusion, should not be the first book put into the student's hands. Indeed, considering the evolution of language alone, we think that Zupitza's Reader will succeed better than any other single book in giving one a general idea of the state of England in olden times.

Aside from this, we have noted several features in the present work which seem to us decided faults of editing. To begin with, the editors have retained the *ā*, *ae* of Heyne's text, instead of adopting the English typography, *ae*, *æ*. Inasmuch as the Grimm-Grein typography has been abandoned in Germany itself, we do not see why it should be revived in America. A still graver objection must be raised against the arrangement of words in the vocabulary. Here we will speak out our mind once for all, without fear or favor. It is high time that lexicographers of Anglo-Saxon should grapple in earnest with the *vowels* and dispose of them. The present editors have blindly followed Heyne's example, and treated the vowel *a* under four separate heads: *a*, *ā*, *â*, *ae*! This is unqualifiedly wrong. Grein tried it in the first part of his 'Glossar,' but abandoned it in the second, retaining only the two fold arrangement of *a* unmodified and *a* modified. Even this is too much. All four shades of the vowel should be indexed as one. There need be no hesitation. Zupitza has adopted it in the vocabulary to his Reader, and Sievers evidently favors it. Why should we do more than the editors of Latin and Greek? Our readers have only to imagine a Latin dictionary with all the long *a*'s separated from the short. In a special glossary, like that to 'Beowulf,' the inconvenience of the present arrangement is barely endurable. But in a lexicon for the whole language, it would be simply intolerable. Editors should remember that dictionaries are not root lexicons. Besides, according to the method followed by the present editors, every one has to commit himself at the outset to a decided opinion upon the length of vowel in every word. This is extremely wasteful of time, and is also attended with the dangers that inevitably beset etymologizing to order. Thus *ăled*, fire, is entered under short *ae*. Whereas Kluge (*Anglia* IV., Anzeiger 17) shows it to be long. (See also Sievers's Grammar, § 244.)

Going still further, we venture to say that long and short *o* and long and short *œ* ought to be indexed as one vowel; why should an Anglo-Saxon lexicographer be more discriminating than the editor of a dictionary of modern German? The same may be said of the *i* and *ie* sounds. Practically they are all one for lexical indexing. The only occasion for doubt is the treatment of *ea*, *e*, and *eo*. The *ea* really stands for *a*, or *ae* (cf. Sievers, § 35). Yet it could scarcely be indexed under *a*. Our preference would be to treat *ea* before *e* (and not after *eo* [!] as in the present book) and throw the *e*, *ē*, *eo*, *ēo* all under one letter *e*. This is the only escape, so far as we can see, out of a maze of forms. If there is any one quality more in demand than another for Anglo Saxon lexicography just now, it is the quality of *courage*. We must learn to throw off the fetters of an antiquated classification.

We take the liberty of noting some of the more obvious inconveniences into which our editors have been misled. The numeral "one" is inserted first, p. 116, under long *a*; again, p. 120, under long *ae*. The preposition *on* is inserted under short *o*. Thus the pupil becomes disqualified for recognizing the fact (cf. Zupitza's text of the battle of Brunanburh) that *on* was probably pronounced long, as the MS. accents indicate. The insertion of *anweald* under short *a* precludes the treatment of it as possibly *ānweald*, "sole ruler."

We have noted, also, several slight errors in the Glossary. Thus *bend*, given as masc., has forms of both genders (cf. E. St. vi., 290). The word *heorte*, entered p. 207, should be transferred to p. 208; besides, it is *feminine*, not neuter (cf. Sievers, § 278, § 280). The word *betweonum*, treated p. 284, under *tweone*, should be treated under *be-*, as a separable preposition = modern English "between" (cf. Sievers, § 329, and the passage in 'Andreas,' 558: *hû ðaet gewurde be werum tweonum*—"how that came to pass among men"). This passage is especially interesting as an evidence of the use of the preposition to express plurality, instead of mere duality. *Stânfah*, verse 320, can scarcely be translated "with stones of different colors." Would the editors have us believe that Beowulf and his men march over a mosaic pavement? Grein's (oral) interpretation was that the poet meant to suggest a Roman military road, easily recognizable from a distance. With regard to *hrînde*, 1364, the editors do not seem to be aware of Morris's emendation *hrîmige*, adopted by Sweet and also by Wülcker (cf. Sweet's Anglo-Saxon Reader, second edition). With regard to the phrase *onband beadurûne*, verse 501, we cannot agree with any of the accepted renderings. It seems to us that the phrase is a mere standing expression (not confined to the present occasion of B.'s visit), and means that Hîmferð was court poet, or orator, in the habit of narrating past exploits. And should not *rûn* in the Glossary be defined as "council," rather than "counsel"?

On the other hand, the Glossary has many ex-

cellent features. It enters not only verbs, but nouns and adjectives, compounded with *ge-* under the main word, disregarding the *ge-*. Herein the editors have followed Heyne. Also, derivative verbs are placed under the primitives, as *ábelgan* under *belgan*. This is undoubtedly the best arrangement for a special vocabulary like the present, but we raise a note of warning against adopting it for a general lexicon. With regard to the indexing of *a* before a nasal, as *=o*, the editors do not seem to have followed any fixed principle; they evidently prefer to index under *a*. In a 'Beowulf' glossary the point is not important, although it is scarcely fair to state that *and* is the usual MS. spelling of the conjunction, when Wülcker's transcript shows that the MS. employs the sign]. But for general lexical practice we cannot refrain from urging the advantage of uniformly indexing according to the Wessex spelling, *o*.

We hope that our strictures will not be misconstrued as a general condemnation. On the contrary, we predict that the present edition will supersede all others wherever 'Beowulf' is taught in English speech. It is practical and scholarly. There is not a trace of slovenliness from beginning to end. The editors have done good work, even if we believe that they might have done better by breaking with now useless traditions. Their book will take its place by the side of Garnett's translation, to the lasting honor of American scholarship.

From Ponkapog to Pesth. By Thomas Bailey Aldrich. Boston: Houghton, Mifflin & Co.

THIS is a little volume of what in French would be called "impressions" of travel. It has very little to do with either Ponkapog or Pesth, except that it might have been written by a native of Ponkapog who had been to Pesth—that is, if he had been to a good many other places besides. It records the impressions of a literary American as to some of the differences between the Old World and the New. It was hardly to be expected that in such a field Mr. Aldrich would find it possible, or indeed attempt, to give any distinctly new information. The ground has been gone over so many times that we do not expect this. All that an author can give us is the opportunity of seeing the old sights and places for the moment with his eyes, and the value of the opportunity consists almost entirely in the power or delicacy of these temporarily borrowed organs. Mr. Aldrich's eyes are primarily those of a poet. He has the sensitive temperament of a poet, and a poet's delicacy of expression. A dash of somewhat extravagant humor is thrown in, but this often seems to be done in obedience to the fashion of the day; for Mr. Aldrich's natural humor is quiet and shy, and not at all fitted to the service to which he now and then attempts to put it. The most entertaining chapter of the book is that, perhaps, on "Ways and Manners," in which the author contrasts the manners of the European railroad officials, hotel-keepers, and servants with those of his own country, to the great disadvantage of the latter, as follows:

"The guard who has charge of your carriage on a Continental railway, so far from being the disdainful autocrat who, on our own cars, too often snatches your ticket from you and snubs you at a word, is the most thoughtful and considerate of men. He looks after the welfare and comfort of your party as if that were the specialty for which he was created; he never loses countenance at your daring French or German, or the graceful New England accent you throw upon your Italian; he is ready with the name of that ruined castle which stands like a jagged tooth in the mouth of the mountain gorge; he does not neglect to tell you at what station you may find an excellent buffet: you cannot weary him with questions—he will smilingly answer the same one a hundred times; and when he is killed in a collision with the branch train, you are not afraid to think where he will go, with all this kindliness."

Mr. Aldrich, however, overlooks, in the case of the conductor, the fact that the view generally taken of his relations to passengers in this country is exactly the opposite of the European view, and really excludes civility from our conception of the type as it ordinarily exists. The passenger [illegible] asks a number of questions of the conductor instead of finding for himself all about it from [illegible] other and not very clearly-defined source, is a constant object of ridicule in the funny columns of the press with us, while the unresponsive conductor never is. The respect of the American public for the conductor is very great, and this cannot be merely on account of his power and authority. There is apparently a good deal of popular sympathy with him in his "life-struggle" with the troublesome passenger, and the profoundest contempt for the feeble resistance which the passenger sometimes offers him.

By JOHN HABBERTON, Author of 'Helen's Babies.' 16mo. (Lives of American Worthies Series.) $1.25.

DR. DEWEY'S LIFE.

"Delightful in every way as a memoir, the book is in no way more delightful than in the vividness with which it presents Dr. Dewey to us in all the freshness of his vigor. . . . The whole book, indeed, is remarkable for its humor, and is, in its way, as entertaining as a novel. . . . It does us infinite good when we find that a great man can be funny, and Dr. Dewey's fun frequently rises to the level of wit. . . . In brief, this 'Autobiography and Letters' is a book to interest any one, irrespective of sect or personality," says The Critic. Second edition, price $1.75. ROBERTS BROTHERS, Publishers, Boston.

English Books.

DUTY PAID AT 33 CTS. TO THE SHILLING.

Duty being now collected on all Foreign books coming by mail, causing delay and annoyance, we beg to offer our services to book-buyers for the importation of Foreign books, from England as well as France and Germany, in weekly shipments, having the best facilities and over thirty years experience.

Parties preferring, however, to have Books or Periodicals sent by direct mail, can have their orders attended to, at original prices, through our house by having their addresses registered at our London, Paris, and Leipzig agencies. This will simplify accounts, save foreign correspondence, and the unpleasant experiences with foreign agents.

Our Monthly Book-Lists (English, German, French) are mailed to any address for 12 cts. a year each for postage.

English and other second-hand books. Book Catalogues mailed on application.

B. WESTERMANN & CO.,
838 BROADWAY, NEW YORK.

Johns Hopkins University,

BALTIMORE.

American Journal of Philology.

VOL. IV., NO. 3, NOW READY.

Subscription, $3 a year. Single numbers, $1.

MARTIN LUTHER:

A Study of Reformation.

By EDWIN D. MEAD,

Author of 'The Philosophy of Carlyle,' etc.

An essay upon the significant phases of Luther's life and work, with special reference to present problems of reform; discussing the principles of Individualism, Intellectualism, and Rationalism, for which Luther stood, and the Libertinism, the Old Orthodoxy, and the New Orthodoxy, with which he came into conflict.

Cloth, 12mo, 194 pages. Price $1.25.

For sale by all booksellers. Sent, postpaid, on receipt of price, by the Publisher,

GEO. H. ELLIS, Boston.

IN any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Professor J. B. Fonssagrives's 'Mother's Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1 25 for two volumes. Address Publisher of the Nation.

To Insurance Companies.

A first-class firm with elegant offices, located for past ten years in one of the finest Buildings in Boston, will negotiate with any large Insurance Company with reference to Boston Agency. Address G. & B.,
16 SIMMONS BUILDING, 40 WATER ST., BOSTON.

The Nation.

NEW YORK, THURSDAY, JANUARY 31, 1884.

The Week.

SINCE our article on another page was written, Mr. Sherman's resolutions have proved, as far as their original purpose was concerned, a complete failure. They have produced no debate and no excitement. Even Mahone gave them but feeble support in the printed slips which he read, for he denied that the bulk of the people of Virginia were responsible for or approved of the Danville outrages; and if the people of the State did not approve of them or were not responsible for them, of course they become an ordinary election riot, to be dealt with by the local courts. The Copiah County (Miss.) troubles have even less political significance than the Danville troubles. That such things ought to be exposed and criticised, we would be the last to deny. It is by such exposure and criticism, drawing after them the reprobation of the civilized world, that the condition of the South in this respect is to be improved, but it is preposterous to waste the time of the National Legislature quarrelling over Southern outrages and arguing about them, when it is well known that no legislative action about them can or will be taken. We do not know that there is any serious objection to Congressional inquiry into them, but it must be borne in mind that no report of the result of such inquiry will be made for months; that when it appears the whole country will be absorbed in the Presidential canvass, and the outrages will be forgotten everywhere but in the newspaper offices, and that it will, therefore, be read by nobody or by very few. Moreover, it is not the kind of attack on Southern lawlessness which produces most impression at the South, or contributes most to reform Southern manners. The South has long ceased to regard the waving of "the bloody shirt" in Congress as an expression of honest Northern indignation. They now universally regard it as a signal, meaning that the Republican party is short of "capital," and would like to replenish its lockers. The silence with which the Southern members listened to Mr. Sherman shows that even for this purpose it is now worthless. It will probably never be hoisted again.

There are three banking bills which will be discussed in the Senate: one drawn by Mr. Sherman, one by Mr. Aldrich, and one by Mr. McPherson. This last, after a long discussion in committee, was reported to the Senate last week by a Democratic party vote, and is before the Senate as a purely Democratic measure. Its provisions are that upon a deposit "of any United States bonds bearing interest, in the manner required by law, any national banking association making the same shall be entitled to receive from the Comptroller of the Currency circulating notes not exceeding in amount the par value of the bonds deposited: Provided, That at no time shall the total amount of such notes issued to any such association exceed the amount at such time actually paid in of its capital stock." Messrs. Sherman and Aldrich will propose their bills as independent measures, and the discussion, which was inconclusive in the Committee, will be reopened in the Senate. The Sherman bill allows the banks, as at present, to issue notes to only ninety per centum of the par value of bonds deposited, bearing interest at the rate of not less than three per cent., and provides that at no time shall the total amount of notes issued exceed the amount actually paid in of capital stock, nor shall they exceed at any time ninety-five per cent. of the par value of the deposited bonds and interest. The Aldrich bill authorizes the Secretary of the Treasury to receive bonds bearing four per cent. interest, and issue in exchange bonds bearing three per cent. interest, which shall be exempt from taxation and payable on the date fixed for the payment of the bonds for which they are exchanged. None of these newly-issued bonds shall be called in so long as bonds bearing a higher rate of interest are outstanding. Any national banking association which shall deposit these new bonds as security shall be entitled to receive circulating notes to the full par value of those bonds.

The Mormon Commission will, we trust, see the importance of throwing any light in its possession upon the question as to how much polygamy there actually is in Utah. They disfranchised, we believe, only 12,000 persons for having more than one wife or husband, and yet there are about 130,000 Mormons in Utah. As they exercised their powers in a very thoroughgoing way, this looks as if there had been at least great exaggeration as to the number of polygamous families in the Territory. We cannot vouch positively for the above figures, but they are given as correct by a Mormon delegate to Congress, Mr. Caine, and it is high time the matter should be looked into.

Besides the economical difficulties, the constitutional objection to any wholesale regulation of the railway system by Congress seems at least worth thinking about. The Constitution gives Congress the power merely to "regulate commerce with foreign nations and among the several States." Does this give Congress the power to say for how much a railroad chartered by Massachusetts shall carry a bale of goods to Chicago? The contract is made in Massachusetts to be executed outside its limits, to be sure; but still it is a Massachusetts contract, and moreover it is made by a corporation deriving its existence and its power to make the contract from the State Legislature. To say that such contracts shall be made only on terms prescribed by Congress, and to derive this from the power to "regulate commerce," seems to be the longest stride in the direction of centralization that has been proposed yet. The majority of the Commerce Committee is Democratic, and just now may be ready for anything; but there is nothing in the history, even in the recent history, of the Supreme Court to warrant the belief that a majority of the judges are ready to take such an extremely broad view of the powers of Congress as a Congressional regulation of railway rates involves.

There is one consideration connected with the art-tariff question which strongly favors the total abolition of the duty. This is the desirableness of facilitating the entry, free from all entanglements, of pictures intended only for exhibition, and which would have to pay the duty without any possibility of pecuniary advantage accruing to the owner. There are certain relations in which art stands to trade that are peculiar. The owners of celebrated pictures, for instance, have often a pride in their being of the widest possible utility, quite unlike the feeling they might have about their houses or carriages. They are glad to have all the world admire their pictures, and will even make some sacrifice to that end. Pictures, unlike other property, are none the worse for the widest utility. A thing of beauty is not only a joy forever—*i. e.*, as long as it lasts—but does not wear out by being enjoyed generally. Pictures differ from books and some other educational appliances in being only greatly valuable in the original, for of the greatest work no reproductions are possible. In excluding, as we do by our duty on pictures, all works of the higher class, and the unpurchasable pictures which the love of art might induce their proprietors to send over to America for exhibition, we lose the chance of seeing many phases of art which might be of great educational use to our artists and public. We put it out of the question for foreign artists to contribute to our exhibitions. Such collections as the Royal Academy winter exhibition of old masters and deceased painters are to our public unattainable.

The most entertaining deliverance on the vexed question of woman's rights we have had for a good while, has just been made by the Solicitor of the Treasury, in an opinion on the legality of issuing a license as master of a steamboat on the Mississippi to Mrs. Mary A. Miller of Louisiana. There has been nothing quite equal to it in the way of fine and solemn writing since Judge-Advocate Holt's report to President Lincoln on Fitz-John Porter's case. He decidedly objects to Mrs. Miller's getting the license, not on legal grounds, for "the law is silent as to sex," but apparently on the ground that "it would shock the sensibilities of humanity," and "would be opposed to the principles which underlie the Christian civilization of the age in which we live"; and he declares boldly that "one of the greatest elements in this civilization is the relation between the sexes." There then follows a eulogy on woman's influence which, for warmth of feeling and chaste beauty of diction, has few if any parallels in modern literature. "No

man," he says, "bows with more sincere devotion to the power, the majesty, and the influence of woman than I do," and he is willing to admit that women may have to earn their living, but not, he holds, "in Mississippi steamboat navigation." He goes still further, and declares that if women are admitted to *all* occupations, "the relation between the sexes will have lost all its unselfish devotion, and the vows plighted at the altar will have no more restraining solemnity than a contract to furnish so many gallons of whiskey or so many bushels of beans." The only way out of this scene of horror which he sees, is to give the license to some man designated by Mrs. Miller, who would nominally command the steamboat, while she held the real authority. We trust Mrs. Miller will acquiesce in this suggestion, and help to save at least one or two of the principles which underlie our Christian civilization.

Owing to our still imperfect modes of transmission, the Solicitor has been obliged to explain that he did not say that he "bowed to the necessity," but to "the majesty of woman." This was a telegrapher's mistake. The rest of the opinion, however, stands as reported in its cold, classical, though almost cruel beauty. It will doubtless ring in Mrs. Miller's ears for many a day as she paces the wet deck or dozes in the lonely pilot-house, like a voice from the regions of Eternal Propriety and Immutable Division of Labor. We should not indeed be surprised if sometimes, as she floats down the river and repeats or hums it to herself, she should, in spite of its hostility to her claims, say to herself, like Wolfe about Gray's 'Elegy,' that she would sooner have written that one paper than command and own the biggest steamboat on the Mississippi.

The speech of Mr. Olin, the clerical member from Broome, in the Assembly on Thursday, in support of a prohibition amendment to the Constitution, appears to have been much more skilful and to have made more impression on the audience than most of the oratory from that quarter. But he, of course, did not succeed in convincing anybody that absolute prohibition could be carried out in this State, or that it would not result in giving the liquor trade a great stimulus, under conditions far worse for morality and order than those which now exist. There is no question that the public conscience all over the country is becoming more and more aroused about the effects of alcoholic drinks on the public health and order, and that the determination to restrain or control the sale of them is growing rapidly. What more than aught else impedes this movement to-day is the fact that it gets no help from those who are most in earnest in their hostility to drink. It is this which makes the temperance agitation so different from all other reformatory agitations. We believe we are not wrong in saying that temperance reformers are the only reformers who have refused, and do refuse, to take their claims in instalments, or to help anybody who only seeks a part of what they are striving for. The result is that the cause of temperance is, for all practical purposes, left in the hands of those who are not enthusiastic about it, and only help it when they have nothing more pressing on hand.

The discussions of the Adirondack question generally take for granted that the woods are to be necessarily preserved in their present condition and allowed to stand, as primeval forest, unproductive and a cause of expense to the State. But any one who has visited those sections of the Alps which have been reforested, or those which have been put under State superintendence for preservation, or who has even passed through the great forest of Ardennes, will have seen in successful operation a system of forest-farming which not only pays the expense of preserving the forest, but makes an excellent investment of the operation. In the Veneto the mountain-tops, where once denuded of forest, have been replanted with larch and fir, and a large proportion of the lumber from that section comes from these plantations. The Italian Government has formed forestry schools and bodies of forest guards; Vallombrosa and Abetone are huge tree-farms in Central Italy, which are extending their jurisdiction and operations as far as their means and organization permit, and always with profit. A Belgian proprietor residing near the forest of Ardennes informed us that the proprietors found that the land cultivated in trees and cut once in a hundred years—*i. e.*, the trees being selected according to their condition, and cut at the rate of 1 per cent. per annum—paid just as well as raising wheat on the same extent of land. What is wanted, then, in our forest management is the application of a vigorous system of intelligent official superintendence to the cutting of the trees, none but those marked for cutting to be allowed to be cut, and the lumberers being placed under the necessity of removing all the branches, brushwood, and dead wood which form the fuel for the conflagrations. This would pay even now as management, and in the course of the not long time which will see all our unregulated forests exhausted, the forests so controlled and policed will furnish an excellent investment for the capital employed in keeping them from present destruction, besides maintaining a practically inexhaustible source of material for those manufactures which depend on wood. The lumberers now cut all the desirable trees as they go, littering the ground with an enormous mass of small branches and dead wood, which becomes as inflammable as powder and which is the really dangerous element in the great conflagrations. These never burn but only scorch and kill the standing trees, and subsist and spread by this litter of the lumbermen, who are utterly indifferent to what happens to the country when they have got their logs out.

The Rowell murder trial promises to have some peculiar features. Rowell killed Lynch for being too intimate with his wife. He lay in wait for him, and killed him, if not deliberately, at any rate carefully. His friend Palmer testifies that he furnished Rowell with a revolver, and advised him to throw pepper into Lynch's eyes. Now what position does this put Palmer in? His testimony closely resembles that of an accessory before the fact. Rowell says that he was insane, and if he was, Palmer we suppose was too. To furnish a friend in Rowell's condition with a revolver, if the act of a sane man, is simply to send him out to commit a murder.

The *Christian at Work*, a religious paper in this city, has come out in favor of what may be called precautionary homicide. It holds, apropos of the Nutt case, that where the law fails to maintain "the right to life and the right of self-defence, the individual may secure his own rights." Therefore, Nutt was right "to take a pistol and shoot the dog down as he deserved." It appears that people who do not concur in this view are either "doctrinaires," or "persons who regard the law as an end rather than as a means," or "into whose judgment some personal elements enter"; meaning by this, we suppose, people who are afraid of being shot themselves. The fatal defect in this preaching is that it does not provide any tribunal to decide when the law has failed to do justice. It leaves the person who feels the wrong to decide for himself that his only remedy is murder, or in other words makes him both prosecutor, judge, jury, and executioner in his own case. Billy McGlory might justify himself, under this rule, for shooting the editor of the *Christian at Work* for interfering with his business, and call anybody who protested a "doctrinaire." We, for our part, think preachers of this kind almost as mischievous as the murderers, and ask no mercy for them from any shooting man who thinks they have wronged him, and that the law will give him no redress. He may, of course, make mistakes, but everybody makes mistakes. The great thing is to have his natural desire for blood and vengeance gratified.

The difficulty of imposing any legal restraint upon the excesses of insanity experts in criminal trials has long been felt, but little progress has been made, as a glance at the reported proceedings in any important criminal trial will show. The performances of the doctors in the Nutt case, luckily for them, escaped attention, because it was treated as a foregone conclusion that Nutt would be acquitted. But the way in which a criminal escapes is sometimes as interesting as the mere fact itself. The Pennsylvania Legislature, for the purpose of imposing some sort of responsibility upon "experts," passed a law some time ago requiring any acquittal on the ground of insanity to be followed, if the judge thought it advisable, by a medical inquest. If this resulted in a decision that the prisoner was still insane, he was to be sent to an asylum. The reformers who passed this law said to themselves, "Now we have got murderers and experts in a tight place. A murderer, even with the aid of experts, will either be hung or be confined so that he can do no further harm."

Now, let us see how this law works in the first case in which any strain has been put upon it. Nutt's defence was insanity, and the experts trooped in and swore that he was, at the time that he killed Dukes, as mad as it was possible to be. Some of their testimony was to the effect that he had always had a tendency since childhood to insanity. The object of this was to establish what is called "emotional" insanity—*i. e.*, insanity which comes on when the murderer gets a chance to use his pistol, and stops as soon as he has killed his enemy. The Judge who tried Nutt threw cold water on all this, and, indeed, every lawyer knows that "emotional" insanity is merely another name for the heat of passion which leads to the murder, and for giving way to which we hang murderers. Nevertheless the jury brought in a verdict of not guilty on the ground of insanity. The next day the judge summoned the experts again and bade them closely examine Nutt once more and pass upon his mental condition. Cheerfully they went to work, just as if they had never heard of the case, and soon came back and solemnly declared that the "mentality" of Nutt was all that need be desired. It is really the doctors who have set Nutt at liberty. We must say that such proceedings as these reveal a very extraordinary state of mind among "experts" as to their own professional responsibility. Juries acquit guilty criminals continually, but then a jury is often an ignorant, untrained body, governed by passion and prejudice. An ordinary acquittal against evidence is a very different thing from members of a learned profession furnishing a professional basis for a glaring burlesque of law and justice. The effect of this whole expert business is heightened when we remember that experts generally testify for pay, so that their performances would, one would think, be closely watched by their own profession to see that they do not bring it into disgrace. The whole medical profession suffers now from every murder trial, particularly that branch of it which is devoted to mental disease. Is there no way in which it can discipline its experts or curb their excesses?

Mr. Chalk, of Charlotte, N. C., had an unpleasant experience a few days ago with Mr. Butt, of the same place. This is how it was. Mr. Chalk is suing the Traders' National Bank for $8,000, before Messrs. Butt and Brenzier, as referees of the court, the bank having in some manner failed. Now, pending these proceedings Mr. Chalk injudiciously wrote a letter to the *Gastonia Gazette*, making the charge, among others, that Mr. Butt had borrowed $8,500 from the bank, "in order to reduce the capital stock." Under these peculiar circumstances, there was nothing left for Mr. Butt to do but wait upon Mr. Chalk with a cowhide, which he did. He asked for a retraction, but this Mr. Chalk could not give, because the books, he said, showed that the charge was true. Thereupon Mr. Butt proceeded to discharge the very painful duty of striking him over the head with the cowhide. Now, in times not very remote, Mr. Chalk would have drawn a pistol and begun firing at Mr. Butt, but this seems to be no longer necessary. He simply opened the window, and began uttering a cry which has probably never before been heard in a Southern town under like circumstances, and which speedily aroused the whole neighborhood, the cry of "Police, police!" He continued to cry "police" as long as Mr. Butt continued to strike him, and then was silent. The police did not come; but this first great Southern recognition of the supremacy of the law was none the less complete. Mr. McAden, the assignee of the bank, against whom Mr. Chalk had made similar charges, hearing that Mr. Chalk could be conveniently and safely cowhided, at once started for his office with his cowhide, but was met at the door by Mr. Pittman, who also began shouting "Police," whereupon Mr. McAden retired. May we not be seeing in these two little incidents the dawning at the South of a better day, in which this single word "police" will make knives and shot-guns harmless ?

Sympathy for the crimes of "boys," merely on account of their tender years, is beginning to die out in the West. In Indiana two young criminals have just been hanged for the murder of a companion, after a fruitless attempt to get them pardoned. The notion that a murderer is entitled to peculiar sympathy because he falls short of having attained the age of legal majority by two or three years is really fallacious. A boy of eighteen, who has been allowed to run wild ever since he was able to run at all, is as dangerous a creature, especially if he goes armed, as he so often seems to do, as if he were nineteen, twenty, twenty-one, or twenty-five. Almost all the great habitual criminals of the past began their careers of crime when very young. The only difference is that they generally began with some minor crime, like robbing the till of the store in which they were employed, or stealing money out of their mother's pockets. Our boys appear to prefer to go the "whole animal" at once, and set up as murderers as soon as they begin at all.

The foreign demand for our breadstuffs, provisions, cotton, petroleum, etc., is not active, and the total export of these items since December 1st has been from $16,000,000 to $17,000,000 less than during the same period last year. This has caused a continued scarcity of foreign exchange, and the rates for sterling in New York have advanced from $4.85 for demand bills about January 1st to $4.88¼, which is within one cent on the pound of the gold-exporting price. Complaints of dull trade are general throughout the country. Further reductions of wages have occurred in two notable instances during the past week, namely, by the Waltham Watch Company and the Fall River Print Manufacturers. Mercantile credit, on the other hand, is now generally good throughout the country. Failures have greatly diminished in the last few weeks, and if the general condition of prices and the general attitude of capital are not gratifying, they are at least safe, and any change is likely to be for the better.

The Austrian Government as well as the Russian seems likely to have to contend with the Nihilists, who are apparently showing their old force and activity in Russia. The successful murder of Col. Sudeikin at St. Petersburg is the most clever piece of work they have yet done. He had risen into power and favor with the Court altogether through the skill with which he hunted the Nihilists down and frustrated their plots, and had escaped them a score of times. They caught him at last in actual consultation with his own most trusted employees, who seem to have been in the Nihilist ranks. Apparently he pushed the rule "set a thief to catch a thief" a little too far, for he accepted the services of a captured and ostensibly converted conspirator, and relied on his gratitude to insure his fidelity. This man lured him to his doom. Colonel Sudeikin's death is said to have again thrown the Court into a panic, for it shows that there is no absolute security anywhere. The propagandism seems now to have reached Vienna, where an active detective has been shot down in the street by a murderer, who is described as elegant and refined in exterior, but whom nobody knows, and who refuses to give his name or tell anything about himself, except that he is the agent of a Socialist Executive Committee.

Chinese Gordon, who is by far the best authority in everything relating to the Sudan, puts an end, in a talk with the correspondent of the *Pall Mall Gazette*, to a great deal of fiddle-faddle about the religious character of the Mahdi's movement:

"That the people were justified in rebelling, nobody who knows the treatment to which they were subjected will attempt to deny. Their cries were absolutely unheeded at Cairo. In despair they had recourse to the only method by which they could make their wrongs known; and, on the same principle that Absalom fired the corn of Joab, so they rallied round the Mahdi, who exorted them to revolt against the Turkish yoke. I am convinced that it is an entire mistake to regard the Mahdi as in any sense a religious leader; he personifies popular discontent. All the Sudanese are potential Mahdis, just as all the Egyptians are potential Arabis. The movement is not religious, but an outbreak of despair. Three times over I warned the late Khedive that it would be impossible to govern the Sudan on the old system after my appointment to the Governor-Generalship."

The Mahdi's brother-in-law, who has been captured and is now in Cairo, fully confirms this. He denies that the Mahdi has assumed any religious apostolate. He is, he says, "merely defending his country against exorbitant taxation and the suppression of the slave trade, which two causes are," he says, "reducing the Sudan to beggary." Of course there is much probability that if the Mahdi's rebellion is allowed to succeed, it will spread throughout Arabia, but it will spread simply as a rebellion against Turkish rule in all forms, whether plain Turkish or Egyptian-Turkish. This has long been the curse of the Arabs, as well as other races, and they are doubtless ready to rise against it under the standard of any true believer who shows that he can win battles.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, January 23, to TUESDAY, January 29, 1884, inclusive.]

DOMESTIC.

IN the Senate on Wednesday Senator Sherman (Rep., Ohio) offered a long preamble and resolution on the Danville, Va., and Copiah County, Mississippi, outrages. The preamble recites the details of the outrages, showing that they were the result of systematic efforts to intimidate the negro race from voting the Republican ticket. The resolution is that the Committee on Privileges and Elections inquire into all the circumstances of the outrages, and into the condition of the constitutional rights and securities of the people of Virginia and Mississippi, and that it report by bill or otherwise, as soon as may be; and that it have the power to send for persons and papers, and to sit during the sittings of the Senate.

The Democratic United States Senators, in a caucus on Monday afternoon, voted to discourage any violent sectional debate so far as possible, on the Sherman resolution. Consequently, when the latter came before the Senate on Tuesday, after Mr. Sherman had made a temperate speech, and Mr. Mahone had argued that the Danville outrage was the result of the direct action of the Bourbons, there were no replies from the Democrats. The resolution was put to vote, and carried by a party majority.

The Senate adopted a resolution on Wednesday asking Attorney-General Brewster for all facts relating to the reasonableness of the charges of the Government's counsel in the Star route case, and his reason for paying them. On Thursday a resolution was adopted to give each Senator, not a chairman of a committee, a clerk at $6 per day.

Mr. Hoar's bill to provide against a possible vacancy of the Presidential office passed the Senate on Friday. In case there is no President or Vice-President it vests the office, in order, in the Secretaries of State, the Treasury, War, the Attorney-General, Postmaster-General, Navy and Interior.

The Greely relief resolution, passed by the House, was also passed by the Senate on Thursday, after it had been amended so that the men who are to form the relief party shall be volunteers.

The Senate Finance Committee on Thursday agreed to report the McPherson bill to provide for the issue of circulating notes to national banking associations. The bill provides that "upon a deposit of any United States bonds bearing interest, in the manner required by law, any national banking association making the same shall be entitled to receive from the Comptroller of the Currency circulating notes of different denominations, in blank, registered and countersigned as provided by law, not exceeding in amount the par value of the bonds deposited: Provided, That at no time shall the total amount of such notes issued to any such association exceed the amount at such time actually paid in of its capital stock." The Republicans of the Committee were surprised at this action, as it had been agreed to report both the Aldrich and Sherman bills, but when it came to a vote Mr. Sherman's bill was amended with the substantial features of the Aldrich bill. This was distasteful to him, and on the final vote he joined with the Democrats of the Committee in recommending the McPherson bill. The result will be that all three will come up for discussion in the Senate, and the disagreement will be there fought out.

The Senate Committee on Appropriations has ordered a favorable report on the House bill making an appropriation to pay the tobacco-tax rebate.

In the House of Representatives on Wednesday, a resolution of thanks was passed to the officers and crew of the revenue steamer *Dexter*, and the men who manned the Gay Head lifeboat, for their brave conduct in rescuing the survivors of the wreck of the steamer *City of Columbus*, and especially to Lieutenant Rhodes, who twice swam to the steamer and rescued the two men who were clinging to the rigging. The debate on the Fitz-John Porter Bill proceeded on Friday and Saturday.

The House Committee on Foreign Affairs is considering the advisability of a Canadian reciprocity treaty. The House Committee on Agriculture has decided to report favorably on the bill to make the Bureau of Agriculture a distinct department and to give its head a seat in the Cabinet.

Papers given to the House Committee on Department of Justice Expenditures show that Eli H. Murray, now Governor of Utah, was guilty of great irregularities when United States Marshal of Kentucky, from 1869 to 1876. The fee bills and emolument returns were systematically swelled by charging fictitious expenses, fictitious fees, constructive mileage, and also by beginning vexatious and boundless criminal proceedings for the purpose of making fees. He was compelled to resign under a threat of exposure, but had influence enough to secure the Utah Governorship. Mr. Murray has telegraphed an absolute denial of all these charges, and asserts his willingness to appear before the committee.

Congressman E. W. M. Mackey, of South Carolina, died in Washington on Monday. The Senate and House adjourned out of respect to his memory.

United States Senator Allison was reëlected by the Iowa Legislature on Wednesday.

John C. New, Assistant Secretary of the Treasury, has resigned his position, it is believed because of disagreement with Mr. Folger.

President Arthur was given a grand reception by the Union League Club of this city on Wednesday evening. Nearly 2,000 people were present.

The annual report of the Government Directors of the Union Pacific Railway Company has been transmitted to the Secretary of the Interior. It expresses confidence in the future of the road, and in its ultimate ability to meet all its obligations to the Government. It adds that the road-bed, track, buildings and equipment of the road are all in excellent condition, and kept well up to the highest standard of the best roads in the country. The feeding lines are bringing each year additional traffic to the main line.

General Grant has written a letter denying that he has any private interest to be fostered by the ratification of the Mexican treaty. He adds: "My whole interest is in developing those relations which, I believe, ought to exist between contiguous countries, and particularly those of like institutions; and, in the case of Mexico, I think it more important because of her great undeveloped resources, which must make her soon a commercial state of very great importance." The friends of the treaty now express confidence that it will be ultimately ratified.

General Sherman positively asserts that he will not under any circumstances accept a nomination for the Presidency. He looks forward to a life of comfort, ease, and freedom from worry of any kind.

The National Committee of the Prohibition Home Protection party has issued a call for a national convention, to be held in Pittsburgh, Pa., on Wednesday, May 21, to nominate candidates for President and Vice-President of the United States.

The Virginia Senate, by a party vote of 23 to 10, passed on Thursday a resolution asking Senator Mahone to resign.

John Letcher, ex-Governor of Virginia, and a member of several Congresses from that State, died at his home in Lexington on Saturday, after a long illness. He was elected Governor of the State in 1859, and held office until the second year of the war.

Mr. Judah P. Benjamin, late of the Southern Confederacy, emphatically denies that he ever wrote a letter, which has recently been attributed to him, in which he, in effect, proposed that the people of the South should renew allegiance to Great Britain.

At Albany on Wednesday a favorable report was made from the Assembly Committee on Cities on the Roosevelt bill, taking from the Board of Aldermen of New York city the power of confirming the Mayor's nominations.

The State Assessors submitted their report to the Legislature on Wednesday. They say that in not one of twenty-seven counties visited does a uniform assessment prevail, and only in the cities of Albany, Oswego, and Elmira. In some counties the assessment is 30 per cent. of the real value, and in others only 18 or 20 per cent. Ingenuity has been taxed to distort the taxation laws. They recommend an income tax on all incomes above $10,000 per annum.

The annual report of the State Board of Charities was presented on Thursday. The value of property in charge of the Board is $43,303,478, of which $7,520,933 is personal estate. The receipts of the fiscal year ended September 30th, 1883, were $10,772,269; expenditures, $9,983,037; number of persons under care October 1st, 52,804. There were 11,343 insane persons in the various institutions of the State on October 1st.

A warm debate took place in the Assembly on Thursday, on a constitutional amendment prohibiting the manufacture and sale of intoxicating liquors. Mr. Olin, who is a Methodist clergyman, made an earnest appeal in behalf of the submission of the question to the people. Mr. Roosevelt opposed the proposition. It was utterly idle to hope, he said, for the enforcement of a law when nineteen-twentieths of the people are against its enforcement. No vote was reached.

A special Board of Commissioners, appointed by Mayor Edson to select and locate lands for public parks in and in the neighborhood of the Twenty-third and Twenty-fourth Wards of New York city, has presented to the Legislature a report of 200 printed pages, with a bill for carrying out the recommendations, providing for the purchase and ornamentation of several large tracts of land in that district.

On Saturday afternoon a syndicate of capitalists in this city and Philadelphia bought 90,000 shares of the treasury stocks of the Oregon and Transcontinental Company. The stock is to be held for investment and will not be thrown on the market. The block is made up of 30,000 shares each of Oregon Railway and Navigation, Northern Pacific preferred, and Northern Pacific common stock. The transaction provides for the immediate obligations of the Transcontinental Company, which amounted to less than $4,000,000. The syndicate includes Jay Gould, Russell Sage, and Work, Strong & Co. A. J. Drexel of Philadelphia takes an interest personally, and part of the stock is also taken by Drexel, Morgan & Co., and the Philadelphia house.

The Reading Railroad shareholders' vote on the question of a dividend resulted on Monday as follows: In favor, 193,282 shares, opposed 195,447. Of those voting against the resolution, 28,925 voted in favor of a dividend on the preferred stock, making 222,207 for such a dividend and 166,522 against it.

Frederick Douglass was married in Washington on Thursday evening to Miss Helen M. Pitts, a white woman, formerly of Avon-

N. Y. The first wife of Mr. Douglass, who was a colored woman, died about a year ago. The bride is about forty-five years of age, and was employed as a copyist in his office.

The Hackensack, N. J., Cemetery Company recently refused to permit a much respected colored man to be buried in their grounds. Governor Abbett sent a special message to the State Legislature on Monday recommending the passage of a law which shall make such a refusal, based on color, a criminal offence, with such penalty as shall prevent a recurrence of such an act.

James Nutt was on Wednesday examined by a medical commission in Pittsburgh, Pa., and declared perfectly sane at the present time. He was then released, and met with a lively popular reception.

More than fifty lives were lost by an explosion of fire-damp at the Crested Butte coal mine, Gunnison County, Col., on Thursday.

Commodore Francis B. Ellison, one of the oldest officers in the United States navy, died on Friday in Boston. He was born in 1803, and was commissioned in 1819.

FOREIGN.

Sir Charles Dilke, President of the Local Government Board, in a recent speech declared that the English Government had great confidence in General "Chinese" Gordon's advice. He said that General Gordon had agreed with the Government upon the expediency of the proposed evacuation of the provinces of Kordofan and Darfur, and the interior of the Sudan. England, he said, has no interest in maintaining Egyptian domination throughout the Sudan, but would maintain that domination upon the Red Sea coast, especially with a view to prevent the slave trade.

General Gordon arrived at Port Said on Wednesday, and proceeded immediately to Cairo. On Friday morning he visited the Khedive, and held a conference with Sir Evelyn Baring, the British Minister, Nubar Pasha, the Egyptian Prime Minister, and General Evelyn Wood, Commander of the English troops in Egypt. The result was that the Khedive appointed General Gordon Governor of the Sudan, with full powers. General Gordon shares fully Sir Evelyn Baring's views in regard to the necessity of a withdrawal from Khartum.

Colonel Coetlogon, Commander at Khartum, has written that there is food enough there to last six thousand men five months, and that the grain supplies are coming in as usual.

Sheikh Obede has summoned Khartum to surrender in order to avoid bloodshed. The town is quiet, but the soldiers are clamoring for their pay. The arrival of General Gordon is anxiously awaited.

The steamers recently sent to clear the Blue Nile have failed of their purpose. El Mahdi left El Obeid about ten days ago. His destination is unknown. He has 37,000 men and plenty of ammunition and Krupp guns.

At a council of war in Cairo on Saturday it was decided to send a brigade of Bashi-bazouks, 2,000 strong, under English officers, to Upper Egypt to support General Gordon, and that Khartum should be held until the arrival of General Gordon, and that all the troops in the Sudan should be concentrated at Khartum. This will give General Gordon 17,000 troops. General Gordon, his military secretary, Lieutenant-Colonel Stewart, and the new Sultan of Darfur started for Khartum on Saturday evening. General Gordon has had £104,000 placed at his disposal for military purposes. The Egyptian Government has borrowed £950,000 from Baron Rothschild for six months at six per cent.

The London *Times*, in a leading article on Tuesday, said the fact that Baron Rothschild had lent the Khedive nearly a million pounds implied the confidence of the financiers that England had taken Egypt in hand and would see her safely through her troubles. England cannot retire now without exposing Egypt to a worse condition of anarchy than that which prevailed under Arabi Pasha.

A Hong Kong despatch points out that the French occupation of Chusan, Formosa, or Hainan would amount to a *casus belli* with England, as, according to the treaty of 1846, it was stipulated that upon the evacuation of Chusan by the British that island should never be ceded to any other foreign Power.

It is not expected that the attack on Bacninh will be made before the beginning of March, as the French are waiting for reinforcements. The Chinese at Canton seem less disposed for war. A despatch from Admiral Courbet at Hanoi, dated January 19, reports that he had established a blockade, which would be maintained throughout Tonquin, to prevent the entrance into the country of all articles contraband of war; but ample facilities would be afforded for legitimate trade. All was quiet at Sontay. The French expedition against the insurgents in the south has been successful.

Placards proclaiming hostility to foreigners have been posted throughout Hoihow, the northern city of the island of Hainan, where a large body of Chinese troops were landed on January 16. A mob gathered and made an attack upon a foreigner, who took refuge in the British Consulate. The Chinese authorities have taken precautions to prevent a recurrence of such demonstrations.

The American Presbyterian and the Roman Catholic Mission establishments in Canton, China, were wrecked by a native mob on December 16. No lives were taken.

A book containing some bitter articles upon Berlin society, which recently appeared in the *Nouvelle Revue* of Paris, has been seized in Berlin by the authorities. The articles are grossly libellous of the Emperor William, the Imperial family, and the German Ministry. The work has created great irritation at the German Court.

In a debate on the labor question in the French Chamber of Deputies on Monday, M. Jules Ferry, the Prime Minister, said he recognized the gravity of the labor crisis in Paris. It would be difficult, he thought, to remedy it. The excess of building had produced a crisis in the building trade. It would be imprudent to open new building yards. The Government was considering a bill to open a credit for agriculturists. The crisis was not general, but was confined to Paris. He opposed any giving of alms by the Chamber.

Edmund About, the novelist, has been elected a member of the French Academy.

A great storm raged in Great Britain and France on Saturday and Sunday. Much damage was done in London, and many persons were injured. Around Paris, railway and telephone communications were severed in all directions.

Mr. Moody, the evangelist, began his mission at Stratford le-Bow, England, on Wednesday. Six thousand people were present, notwithstanding a great storm.

A number of enthusiastic Nationalist meetings were held in Ireland on Sunday.

A large and enthusiastic meeting of Loyalists was held in Dublin on Thursday.

Henry George's pamphlet, 'Social Problems,' which has just been published in London, attracts much hostile criticism.

A detective named Bloch, while going to his home in Floridsdorf, Austria, on Thursday, was shot dead. The assassin, who was apparently a workingman, endeavored to make his escape, but was captured. He had in his possession a dynamite bomb and several murderous weapons. It is believed that he is a socialist.

In the Lower House of the Austrian Parliament the debate upon a motion declaring the German to be the state language has begun and excites great interest.

It is proposed to create a Ministry of Imperial Police in St. Petersburg which shall deal especially with internal politics.

All female medical students in St. Petersburg, a class from which many Nihilists have been enlisted, are now compelled to reside in a house provided by the authorities, and to be at home before 9 o'clock in the evening.

Permission to erect a monument to Luther at Riga has been refused by the Russian authorities.

At a meeting of Senators and Deputies of the Spanish Possibilist party in Madrid on Monday night, at which Castelar presided, it was resolved to advise the party to vote at the general elections; but, if the policy of the Government should be that of Señor Canovas del Castillo, who recently in the Cortez proclaimed the Republican propaganda illegal, the Possibilists, while they would accept the situation with regret, refused to be answerable for what might result.

Notwithstanding the recent change in the Ministry at Madrid, it is asserted in Berlin that Germany still favors Spain's ambition to rank among the great Powers by the conversion of the Spanish Legation at Berlin, and of the German Legation at Madrid, into embassies; but Germany will await an initiative from Madrid in the matter.

Marshal Serrano, the Spanish Ambassador at Paris, tendered his resignation on Friday. He will be succeeded by Señor Manuel Silvela. The Canovas Ministry is very unpopular in Paris.

Herr Lasker's body arrived at Bremerhaven on Friday, and was received with great honors. Eulogies were pronounced upon the character of the deceased Liberal. The body arrived at Berlin that night, and on Saturday evening was solemnly conveyed to the synagogue. On Monday the public funeral services took place before a distinguished audience. Dr. Friedrich Kapp pronounced the oration. A great procession followed the body to the tomb.

Professor Klinkerfüs, the German astronomer, shot himself in the observatory at Göttingen on Monday.

The Legislative Council at Calcutta, which has had the matter under debate, has passed the Ilbert bill so amended that every European prisoner will have the option of a trial before a native or a European judge or magistrate.

The Dutch expedition sent to the relief of the captured crew of the British steamer, *Nisero*, in Sumatra, had several severe engagements with the forces of the Rajah of Tenom. They were unsuccessful, however, in getting the captives, and it is feared the latter have been murdered.

Advices from Madagascar assert that the new Queen, Ranavalona III., was crowned on the 22d of November. The Queen and Premier made speeches in which they declared that they would not surrender an inch of the country to the French.

President Iglesias is not supported with much warmth in Peru, and there are hopeless political divisions. Caceres continues at the head of a band of murderous Indians in the interior.

The so-called Board of Haytian Revolutionists is still in existence in Kingston, Jamaica, but without head or resources.

From a Canadian Parliamentary return it appears that the total Dominion revenue from July 1, 1882, to January 20, 1883, was $19,981,368, and for the same period in 1883 and 1884 $17,869,137—a decrease of $2,112,231. The expenditures for the first-named period were $15,421,657, and for the second $16,406,869—an increase of $985,212.

CONGRESS AND BUSINESS.

News of depression in trade comes from nearly every part of the country. Some factories are suspending work altogether; others are running on half time. In nearly all the trades we hear of reduction of wages, or of lockouts or strikes. Hardly any manufacturers can be said to be making money. They are at most just holding their own, and keeping their work-people together. There is, naturally, much variety of opinion as to the remoter cause of all this trouble. Everybody is of course agreed that the proximate cause is overproduction; but saying that we are suffering from overproduction is hardly more helpful as explanation than saying that a man is sick because he is not well. Overproduction is the sign and accompaniment of all commercial depression. At such seasons, the manufacturers and dealers all suffer from the same cause—namely, the possession of more goods than there is any demand for. The real cause, the *causa causans*, of commercial depression, in so far as it has any cause outside the constitution of the human mind, must be sought further back. In other words, if we wish to know why goods are too plentiful, we must find out why buyers are so scarce.

That our tariff legislation has much to do with making buyers scarce here everybody admits. The Protectionists admit it because they always argue that if we desire to bring good times back, we must make the tariff higher. The Free-Traders admit it, because they always argue that if we wish to bring back good times we must make the tariff lower. In fact, every business man who is consulted about the best means of bringing the existing depression to an end, desires change of some kind in the tariff. Congress met, under the influence of this condition of public feeling, two months ago. During the canvass for the Speakership, all the members were full of the tariff. It was acknowledged in both houses to be the topic of the day. The Republicans maintained that it was going to kill the Democrats at the Presidential election. The Democrats acknowledged, on all sides, that any mistake about it would be very serious for them, and that they could not possibly get out of the difficulty by letting it alone. One might have expected, therefore, that by this time there would have been a great deal of discussion of the tariff, both in House and in Senate, and that a report on it from one if not two committees would have been made, and that Congress would be well advanced towards a final conclusion as to what had better be done about it; and that in order to make way for it, all or nearly all other business would have been laid aside. Nothing of the kind has happened. The majority in the House has not yet ascertained what it thinks about the tariff. In the Senate there is no sign of any particular interest in the subject, and no preparation for any discussion of it.

The Senate has, however, made preparations for one elaborate discussion, the subject of which is to be outrages on negroes and white Republicans at the South. We need hardly say that no legislation is expected or can come of this discussion, and that there is nothing new in the situation at the South to call for it. Outrages on negroes are not increasing. They are diminishing. There is not the smallest sign that the negroes are exposed to anything in the way of violence in that region to which white men, who make themselves in any way obnoxious to the prevailing local sentiment on any subject, are not exposed We make a practice of commenting in these columns from week to week on what we consider typical cases of Southern violence. They are instructive as showing that Southern lawlessness and readiness to shed blood are not confined to any one class of the community, are not directed exclusively against persons of any particular race, or creed, or party, or social grade, and cannot be cured by anything Congress can do. They are, in short, the results of social disease and not of political disturbance. They are of long standing, too. To explain their origin would be to write a history of slave society. To make them the subject of Congressional debate at this juncture, therefore, is not only an expression of contempt for the popular intelligence, and will certainly be punished as such, but is a lamentable waste of time which ought to be devoted to the extrication of the business of the country from the present slough of despond.

Senator Sherman's resolution of inquiry into the circumstances of the Danville and Copiah riots is generally regarded as the first move in a combined Republican attempt to revive the "sectional issue" for use in the approaching Presidential campaign. It furnishes wide scope for a supply of material. It not only calls for an investigation of the riots mentioned, but an inquiry into the "condition of the constitutional rights and securities of the people of Virginia and Mississippi." Its mere introduction excited an acrimonious debate in the Senate, in which Mr. Edmunds and Mr. Lamar used language which some of the more imaginative of the correspondents believed would lead to either blows or a duel. A heated political debate is expected, in which the whole Southern question will be revived, and everything which can be construed as an "outrage" will be put in shape for campaign use. Senator Lamar has written a letter in which he declares his readiness to enter upon the debate, and avows his belief that the "paramount issue before the country is still the reform of the National Government from its sectional usurpation and corruption." This letter is greeted with delight by the Republicans as furnishing them precisely the opportunity which they most earnestly desire. The accumulation of material has thus been begun, and the search for it is eager in all directions. Mr. Cox succeeded the other day in having the House pass a bill for the repeal of the "iron-clad" oath. This bill was the precise measure which was reported favorably to the House in 1877 by Mr. Frye, and passed unanimously at that time. It has also been strongly advocated by Senator Edmunds. When it came up in the House this year there was no outspoken opposition to it, except from Mr. Boutelle, a new Republican Congressman from Maine, who made so absurd a sectional speech against it that the House fairly howled him into silence. Mr. Cox made a speech in its defence which was entirely sensible, with the exception of a few lurid passages. In one of these he said: "Let us bridge over the abysses of civil strife as the Romans did, with a bridge of gold." This was greeted with applause, and was supposed at the time to be a harmless burst of eloquence. Now the discovery is made that the applause came mainly from the representatives of the solid South, and that it was really an appeal for the payment of "hundreds of millions of Rebel claims."

Unless the Democrats pluck up sufficient courage to avow their convictions on the tariff, and force a discussion of that issue, we are likely, therefore, to have another "Southern outrage" campaign, with all its foolish revelations and all its harmful influences. The Southern Senators are not thus far responsible for this folly, but if they take part in the discussion of Mr. Sherman's resolutions they will make themselves responsible. They have no more right to spend the time of the Senate in answering this buncombe than its authors in producing it. They know perfectly well what it is meant for, and that it cannot be made to produce the desired effect without their assistance. Consequently, in answering back, they will make themselves participants in what must, in the existing condition of the country, be an almost criminal misuse of legislative powers and privileges.

THE NEW ANTI-MORMON BILL.

The new bill against the Mormons, reported by Mr. Hoar from the Senate Judiciary Committee, has some features which seem much more practical than those of its predecessors. The lawful husband or wife, for instance, is not only made a competent witness, in any prosecution for bigamy, but is to be compelled to testify. Prosecutions for adultery, too, are to be begun, not simply on the complaint of the injured husband or wife, but on anybody's complaint, like prosecutions for any other crimes. The bill provides, too, for the certification of marriages in the Territories, and for the compulsory inspection by an officer of the United States of all marriage records kept by any person exercising civil or ecclesiastical functions. Female suffrage is to be abolished, though against this Senator Hoar, as in duty bound, enters his pious protest. All property accumulated by religious or charitable corporations beyond the amount limited by the act of 1862 ($50,000) is to be forfeited. A Returning Board of five persons is to be created to take charge of elections and count the votes, but no person is to be disfranchised on account of his opinions about bigamy or polygamy. All this is fairly in the line of legitimate prevention and punishment.

But when we come to the sections which deal with the Mormon Church as a corporation, we meet with some strange features. The Mormons have a corporation called the Perpetual Emigrating Fund Company, which is, we believe, devoted to the work of making converts in Europe and bringing them

over to this country. There is nothing in the missionary work of the Mormon Church to which the United States Government can take exception on the score of the error or absurdity of the doctrines taught, any more than in the missionary work of Catholics, or Spiritualists, or Shakers, unless it can be shown that the converts are to engage on their arrival here in the violation of United States laws. But can this be shown, or has it ever been shown? It is not a violation of United States laws to believe polygamy to be of divine institution, any more than to believe with the Shakers that all marriage is sinful. The violation of the law consists not in thinking that a man may have two wives, but in having them. The present bill expressly provides that no one shall be disfranchised in the Territory on account of his opinions about polygamy. The objection, then, to the Emigration Company is that it brings people to Utah who may possibly, after they get there, commit adultery under the influence of a religious delusion. But is this sufficient ground for the dissolution of a religious corporation by act of Congress? Can Congress do anything of the kind, considering that "the Constitution of the United States, and all laws of the United States, not locally inapplicable," were, in 1850, solemnly declared to be in full force and effect in Utah, as in all other Territories?

More remarkable still is the twelfth section, which provides not that the Mormon Church Corporation shall be abolished, but that the management of it shall be taken out of the hands of the members of it, and committed to fourteen trustees to be appointed by the President, with the consent of the Senate, who shall hold office for two years, and report annually to the Secretary of the Interior, as "to the property, business affairs, and operations of the said corporation." Now, we know that corporations which violate their charter or abuse their franchise may be wound up on the proper presentation of the facts to a court of justice by a legal officer of the Government, and their property be distributed in such manner as the law or common justice may require. We are, too, all familiar with legislation intended, on grounds of public policy, to restrict the accumulation of property by ecclesiastical corporations in general. But we cannot recall any case before this in which it was gravely proposed to punish a corporation for any offence by putting its property into the exclusive control of Government trustees, with directions to continue the business; or to punish a particular ecclesiastical corporation for being too powerful or teaching erroneous doctrines, by committing its affairs to the hands of Government officers who derided or loathed the beliefs of its members. Moreover we do not believe, and shall not believe until the Supreme Court has said it, that any such expedient can be resorted to for any purpose whatever by the Legislature of the United States. It would be a monstrous and dangerous precedent.

Of the practical objections to giving such a huge financial plum as the management of the Mormon Church funds to fourteen trustees appointed by the President and Senate, we need hardly speak. Every one knows the kind of politicians who would seek and get these trusteeships. We see them now starting for Washington with their grip-sacks, after the failure of some home speculation, or after losing their seats in Congress—their natural desire to "handle" other people's funds intensified by their horror of polygamy in all its forms, and their passionate love of domestic purity. The pecuniary scandals of politics during the past twenty years have been great and dreadful, but they would probably all put together be a mere trifle compared to a five years' administration of Mormon Church property by the kind of men to whom we give Territorial appointments.

THE RAILROADS IN CONGRESS.

A VIGOROUS attempt is evidently to be made this winter to settle the inter-State commerce question, or, in other words, to solve what is called the transportation problem. The attempt is, on its face, an important one. According to the census returns, the value of railroad property in the United States is $5,536,000,000, or more than half as much as the value of all the farm property ($10,197,000,000). The bulk of this, it must be remembered, is owned, not by the few dozen "monopolists" we hear so much about in connection with the management, but by hundreds of thousands of plain people who put their savings into railroad bonds or stocks, as a security which rests upon the sure foundation of the general prosperity and stability of the country. The $5,536,000,000 is the property of hard-working, honest men and women, or their families, scattered all over the country, who depend upon it for their livelihood. Besides these, it represents also an immense body of hard-worked employees of all descriptions—not only salaried men, but a vast host of laborers whose day's wages depend upon the system.

It is rather startling, therefore, to learn that the House Committee on Commerce has already before it no less than thirteen bills which undertake to effect changes of the most radical sort in the management of all this property—not merely to determine what the profits of the whole railway system of the country shall be, not merely to revise the railroad tariffs, but to introduce new principles into railroad business, the exact opposite of those which now govern it, or which privately-owned railroads in any part of the world act upon. This novel sort of regulation of business (such as no one has dreamed of introducing in any other branch) is to be undertaken, too, not by a body of men who have made a study of it, but by a fluctuating body like Congress, changing in composition and in opinion, hardly a single member of which is chosen for the purpose of carrying into effect any well-defined theory of railroad supervision.

The result of this is that in the thirteen measures now before Congress, there is hardly a single feature of railroad management as it exists that is not violently and unthinkingly attacked, and the sensible recommendations scattered through the bills—for among so many there must be some sense—are so mixed up with ridiculous or dangerous suggestions that it is very difficult to separate them. Mr. Green, Vice-President of the Pennsylvania Railroad, in the course of an argument before the Committee, has called the attention of the members, however, to the important fact that the bills cover two entirely distinct sorts of legislation, one providing for commissions, the other providing for the direct regulation of rates, and the preventing of drawbacks and pools.

It is the latter class which must be characterized as a direct menace not only to the whole body of railroad property, but to all property in the country. The idea of "fixing rates," or of determining for what price railroads shall provide transportation, means nothing more nor less than that the person or persons who fix them shall "run" the railroads. The Grangers tried this experiment several years ago in the West, and they had everything in their favor, from the control of the local legislatures up to a decision of the Supreme Court at Washington that all States had the abstract right to determine the terms and conditions on which common carriers or similar agents should carry on their business. But the Grangers never succeeded in fixing rates, for though they published schedules, they could never enforce their rates without long legal proceedings in each case; and as they could not take possession of the roads and run them, they gave up the task in some cases, and in others, we believe, simply adopted the railroad rates, called them their own, and "pointed with pride" to them as the result of the movement.

The legislation now proposed is all based on the clause of the Constitution which regulates commerce between the States. Assuming that under this clause Congress has authority to fix the rates charged by roads chartered by the several States, the new Grangers seem to think that they get over all the difficulties which brought their first experiment to grief, because they now obliterate State lines. Therefore we find in one of the most ambitious of the bills before us (that introduced by Mr. McCoid) the primitive Granger idea of upsetting the whole system of railway traffic and introducing the favorite principle of equality, without regard to competition or even difference in actual cost of transportation. The following is the principle as stated in his own language:

"SEC. 3. That said rates, fees, and charges shall be divided and fixed as follows: A uniform, impartial charge for loading, unloading, siding, switching, and a fixed mileage rate for hauling per car, whether the cars shall be one or more cars for each shipper. And rates and charges for less than a car-load shall also be uniform and impartial."

Further, and as an illustration of the beautiful simplicity of the reforms which this thoughtful man proposes to introduce, consider the following:

"SEC. 4. That in the operation of railways among the States the cardinal legal principle in construction of the legality of the acts or omissions of said companies shall be whether in the several acts of the companies said railways are being operated impartially for corporate profit from honest public service. And any acts, contracts, consolidations, discriminations, drawbacks, extortions, poolings, rebates, scales, or failures to render impartial

facilities to connecting lines, in violation of said principle, shall be against public policy and be in violation of this act."

The next section makes any violation of the above a crime punishable by fine. We wonder what the courts would make of all this. What are "impartial facilities"?

There is no reason in the world why a United States Commission should not be created with full powers to make public all facts in connection with the railroad system of the country, and to expose unjust discrimination and extortion, and punish it. The experience of the State Commissions shows that this is needed; for the inter-State routes go beyond the jurisdiction of local commissions, and consequently these bodies cannot perform any effective service with regard to them. This ought to be separated from all attempts to lower the value of the vast aggregate of property represented by the railroads, by the application of communistic theories as to rates, and we are glad to see that the distinction was pointed out by a railroad man to the Committee. What the railroad men ought to do is to help enlighten the public, not simply to defeat hostile legislation.

STATE TAXATION.

THE report of the New York State Assessors contains the now old complaint, which comes up yearly from all the States, about the difficulty of taxing personal property. The assessed value of real estate for 1883, in spite of many imperfections in the mode of valuation, has increased by $124,556,861 from 1882, to $2,557,218,240, while the assessed value of personal estate has within the same period decreased by $35,982,114. More remarkable still, between 1865 and 1882 the real property of the State, judging by the Assessors' valuation, increased $1,398,890,800, while personal property, judged in the same way, apparently decreased $77,500,000. The conclusion the Assessors draw from all this is that the land of the State is growing more valuable through the growth of the State in wealth and population, and that the tax collector cannot get at the personal property because the laws are defective. They propose, therefore, new contrivances for getting at personal property, and among others an income tax on all incomes over $10,000.

This is really a genuine case of kicking against the pricks. It is nearly twelve years since the Hoffman Commission in this State pointed out that the true road of escape from the difficulties of direct taxation, with which all American States have to contend, lay in putting the burdens on the one kind of property which cannot be concealed or carried away or dispensed with. The experience of every State since then, we venture to say, goes to corroborate this view. From every one of them there comes a perennial wail about the difficulty of making people pay taxes on personal property. In some, as in this State, the attempt to reach personal property has been almost abandoned, for this is what an apparent decrease of $77,500,000 in the valuation during the last twenty years really means. In others, efforts have been made to make the taxing machinery more effective by giving the State officers increased powers of inquisition into people's private affairs. In some States this inquisition has become a potent engine of social demoralization. It has, on the one hand, stimulated and fostered the habit of prying and espionage into your neighbor's affairs, which is one of the curses of all small communities, and it has, on the other, greatly strengthened and multiplied the temptations to commit perjury. Every turn of the screw which is intended to force men to confess about their possessions in order that they may be taxed, increases the number of those who get off by lying or evasion. In fact, such a system, rigidly administered, tends always to become a system for taxing the honest and upright, who would pay their dues under any system whatever, and for driving the weak or knavish into falsehood.

The amount of fraud represented by the apparent decrease in the value of the personal property in the State during the last twenty years is of course enormous. But imposing an income tax would not afford any remedy. We should probably have much the same luck in the income field as we have had in the capital field; we should find the number of incomes in the State of over $10,000 begin to decrease rapidly—just as rapidly as the amount of accumulated capital. If it be asked why it should be any more difficult to levy an income tax here than in England, the answer is that England is *par excellence* a country of incomes or fixed earnings, while this is a country of profits and uncertain earnings. The number of annuitants, and salaried people, and people whose incomes rarely vary from year to year, is enormous in England, while here, even among the well-to-do, it is very small. Those among the $10,000 class who are not taking some kind of risk in business are in New York comparatively few, and the others find a hundred excuses satisfactory to their own consciences for swearing down their net receipts in any particular year. So that in proposing new ways of laying bare people's private affairs, the Commissioners are clearly on the wrong track.

This is the more remarkable because their own history of the comparative yield of the two sources of taxation seems to carry on its face the solution of the problem. In looking about for something to base the bulk of the taxes on, it would seem as if the thing which was never concealed, which could not be sworn down, which plainly grew in productiveness with the growth of the State, would attract attention at once. This thing is the land. There is only one real obstacle to making it pay the taxes, and that is the fear of the farmers that the rich men in the towns and cities would escape, if the public burdens all came directly on the soil. That this is a strong prejudice, and one difficult to combat, we do not deny; but that it will eventually be destroyed by the hard facts of the situation, and probably before very long, we have no doubt. Resorting to the land for the bulk of the revenue would not preclude the taxation also of the stock of corporations within the State, because this would be based on the same great rule as the taxation of the land—namely, that a State which is tied up, as American States are, to direct taxation, should never attempt to tax anything which can be hidden or carried away. Tax whatever you see, and which the owner cannot remove, and you will get your money, and avoid fraud and evasion. Try to tax the invisible and removable, and you will find that though you may be ever so certain that it is every year more valuable, your revenue from it either will not grow or will positively fall off.

THE NEW SPEAKER OF THE COMMONS.

LONDON, January 15.

IT has for some little time past been assumed to be settled that when Sir Henry Brand retires at the beginning of the next session from the office of Speaker of the House of Commons, Mr. Arthur Peel, Member for Warwick, and a son of the Great Sir Robert Peel, will be put forward by the Government to succeed him. Although the Speakership is, in this country, a place of far less political influence than it is with you, it is, nevertheless, one of great consequence, the merits or faults of whose holder may make a vast difference to the progress of business in Parliament and the dignity of Parliament itself. So far from being, as at Washington, practically the chief of his party in the House, he is seldom or never a politician of the first rank, and is understood to sever himself from all party ties when he takes his seat in the chair. His only duty thenceforward is to see fair play between different parties, to settle points of order as they arise, to superintend the preparation of proper notices of the business which is to come on, and to keep an accurate record of proceedings already past. His disciplinary power, somewhat increased of late, is exerted only in conjunction with a vote of the House itself. With the composition of committees he has nothing to do; that function, which under our system is of less moment than in your Congress, being exercised by a special committee of experienced and trusted members of both parties, called the Committee of Selection.

But although the Speaker's powers are thus limited to those of mere chairmanship, they are in that sphere very important. Our Parliamentary rules are so complicated that a man must have an exceptionally clear legal head to be able to master and apply them—great promptitude, self-possession, decision. Nor is it only courage to overcome an excited assembly that is wanted. The Speaker must also possess an imperturbable temper and a courtesy of manner which makes his personal relations with the members easy and agreeable. There are many small occasions on which members have to communicate with the Chair; they ask his advice as to the mode in which they can raise a question, or give notice of an amendment; they obtain permission from him to introduce friends into parts of the Chamber not open to ordinary strangers. In order that the general sense of his impartiality may be maintained, the Speaker is obliged to receive every one, even persons who may have lately tried to dispute his authority, with equal serenity and friendliness, and in the exercise of his function of "calling" (that is, of giving the floor to) one among several members who may rise to speak at the same time, he is expected not only to show no preference as between the various political parties, but even to allow the bores and pariahs a fair chance, however little desire the House may have to hear them. Besides these intellectual and moral qualities, the Speaker must be physically strong, at least in capacity to endure fatigue. The House usually meets at four o'clock in the afternoon, sometimes (after

the middle of the session) at two, and sits on till one, two, three, or even four o'clock in the morning, during the whole of which time, except for a short time allowed for refreshment in the evening, he must be in the chair, unable even to close his eyes for more than a few minutes, since at any moment he may have to resolve some point of order or award the floor to one of several competing orators. When the House goes into Committee of the Whole, his place is taken by the Chairman of Ways and Means, but otherwise he has no relief, not being allowed to put a deputy Speaker in the chair unless suffering from illness.

Sir Henry Brand has discharged these duties so well that the difficulty of finding a successor seems more than commonly great. His rulings on points of order have been considered generally right, and were always delivered with great readiness and clearness. His impartiality was so unquestioned that the only complaints ever made were that he was possibly too lenient to those who seemed to be seeking to paralyze and discredit the House of Commons by systematic obstruction. His manners were perfect: full of dignity—a dignity even of carriage, which was noticed the more because he is rather below than above the middle height—and at the same time full of a refined courtliness, which has grown rare in this somewhat too free-and-easy society of modern England. He possessed the happy art of appearing to be specially interested in the person who might be conversing with him; and yet there was no flattery or affectation in what was obviously the expression of a genial and amiable nature.

When it was announced that Mr. Goschen had been asked to permit himself to be nominated, there was some little surprise, because he holds so influential a position as a political leader that he could hardly be expected to relegate himself to an office in which his administrative abilities and his oratorical powers could find no scope. He is wealthy, so that the large salary paid to the Speaker would have no great attraction for him; and though he is at present out of office, because he differs from the bulk of the Liberal party on the question of an extended franchise in the counties, it would be natural for him to rejoin the Ministry when that question has been disposed of. As it appears that he would have been willing to take the Speakership but for his shortsightedness, people suppose that his idea would have been to serve for a few years, until the time came when he could properly return to take that prominent part in the counsels and combats of his party to which his great abilities and high character entitle him. His refusal is regretted on all sides, for he would have made not only an impartial, but an eminently strong and resolute Chairman.

Another member of the House of Commons eminently fitted for the office is Mr. Whitbread, member for Bedford. His position is a unique one. He has never held any office, has never pushed himself to the front, is almost unknown to the general public. But his character is so conspicuously upright and straightforward, his intellect so fair and lucid, his judgment so sound, that when he speaks, which he does but seldom, he is listened to with a deference rarely accorded even to Cabinet Ministers. Those who differ from him think he is at least as likely to be right as they are; those who agree with him are happy and satisfied in having so great an authority on their side. He is the best type, and perhaps the only specimen, in a large assembly, of the ideal impartial observer—philosophical, yet also practical—whose views of current events the historian desires above all things to possess. To these gifts he adds familiarity with Parliamentary rules and forms of procedure certainly unsurpassed, and probably unequalled except by Sir Henry Brand himself. Every one would have been glad to see Mr. Whitbread Speaker. But the uncertain state of his health would have prevented his accepting the chair, and obliged the leaders of the majority to look elsewhere.

Mr. Arthur Peel, whom they have resolved to propose, has had a long Parliamentary and a short official experience. For a few months during Mr. Gladstone's former administration (1868-'74) he was one of the Secretaries to the Treasury, discharging the duties of Parliamentary "whip"; and in 1880, when Mr. Gladstone returned to power, he became Under Secretary of State for the Home Department. This post he soon resigned, owing to weak health, so that people hardly expected he would venture, although now stronger, to enter on duties so arduous as the Speaker's. He is in politics a moderate Liberal, belonging to what is called the Whig section of the party; an able and thoughtful man, who is much respected by his brother members, although, like Mr. Whitbread, not much known to the outside public. The dignity of manner which he inherits from his father is enhanced by a tall figure and well-marked features; and though he is not supposed to have made a special study of Parliamentary law and usage, he is both clear-headed and judicial in mind. Those who know him best declare that in point of tact, temper, and courtesy, he will not fall short even of the retiring Speaker. His task may very likely prove an even more difficult one, for such elements of disorder as exist in the House of Commons may think it easier to challenge a new chairman than one who had already established his ascendency. It may also appear more invidious for the new Speaker than it would have been for the old one to apply the provision lately introduced for enabling closure of the debate (the "previous question" of your House of Representatives) to be voted by the House on the Speaker's intimation. But a man of character, as Mr. Peel is believed to be, will doubtless face these difficulties firmly, and the more firmness he shows the better will he be supported.

It is not usual to oppose the person nominated for Speaker by the majority, unless parties are very nearly equal in strength; and there is no personal hostility among the Conservatives to Mr. Peel which should lead them to resist his election. However, they are at present in a fighting mood, so it is possible they may think that a preliminary skirmish over the choice of a Speaker will do no harm. Their leaders are considering the matter, and their decision will doubtless be made public before Parliament meets on the 5th of February. Y.

MODERN IRISH HISTORY.

DUBLIN, January 12.

THE study of Irish history is sad and depressing, but most instructive. Never did effect follow cause step by step with more unerring and remorseless certainty. We are what we have been made, and the hope of our overtaking those who are before us lies in our being taught in the same schools of experience which have strengthened and elevated them. Three hundred years ago Ireland was dominated by tribal divisions and customs as degrading as those which prevailed in England before the Anglo-Saxon invasion. We search the pages of authentic history in vain for a free, independent, and united Ireland. The struggles with the Anglo-Normans were for land, for existence, for religion. The idea of a real Ireland was first developed during the wars of the seventeenth century. It was carried on by Swift and the patriots of the eighteenth century, though to most of them, it is true, Ireland meant only the Protestant garrison. The conception is perhaps stronger and more definite now than ever before, and Irishmen who know their country's history are animated by hope of a new and better future rather than by a revival of a shadowy past.

Proprietorship in the soil of Ireland has been acquired, not by purchase or by a wrestling with nature, but through repeated and overlying confiscations. There is scarcely an acre of the soil of Ireland upon which we cannot name the families that originally owned the land; the grantee who acquired it by fraud or conquest, and, if his descendants do not now hold it, the transitions by which it came into the possession of the present owners. The tribes held the land in common. The toil of their descendants as tenants gave it its present value without labor or expenditure on the part of the new owners or their descendants, and built up those colossal fortunes which are now drawn from Ireland in the shape of rent. The descendants of the tribesmen, inextricably blended with English names and race (but still definitely distinct in class and feeling), form the mass of the Irish people today. The proprietors are almost as separate a class as they were when they settled down upon their grants under Elizabeth, James, and Cromwell, and built their castles and their "bawns." Religion has accentuated these distinctions. It is as if with you the Indians had lived on and increased, as laborers and tenants, had built up the United States, and were now the mass of the people, and you, the "pale-faces," were in as comparatively small a minority as you were 200 years ago.

The Parliament of Great Britain took upon itself in 1801 to be responsible for the government and happiness of the Irish people. Such a legacy of misery and confusion had seldom been assumed by any people. England believed so fully in her own capacity to grapple with these difficulties that she had deliberately opposed the reformatory measures of the enlightened members of the Irish Parliament, so as finally to compass its annihilation. All doubts as to the mainsprings of Irish squalor and discontent were set at rest in 1845 by the publication of the "Devon Report." The Earl of Devon, an absentee English nobleman, holding estates in Ireland greater in area than the Channel Islands, with four other persons whose prejudices and interests favored the land-owners, had been appointed by the Ministry to probe the agricultural condition of Ireland. The results of their labors may be consulted in four volumes, comprising 4,100 closely printed folio pages of evidence (equivalent to about 6,000 pages of the *Nation*) and 44 pages of report. The report contains a history of the confiscations and anomalies of the Irish land system and a description of the wretched condition of the country, the results of that system. The gist of the recommendations of the Commissioners is contained in the following paragraph:

"Although it is certainly desirable that the fair remuneration to which a tenant is entitled for his outlay of capital, or of labor in permanent improvements, should be secured to him by voluntary agreement rather than by compulsion of law, yet, upon a review of all the evidence furnished to us upon the subject, we believe that some legislative measure will be found necessary in order to give efficiency to such agreements, as well as to provide for those cases which cannot be settled by previous arrangement. We earnestly hope the Legislature will be disposed to entertain a bill of this nature, and to pass it into law with as little delay as is consistent with a full discussion of its principle and details. We are convinced that in the present state of feelings in Ireland, no single measure can be better calculated to allay

discontent and to promote substantial improvement throughout the country."

Clear and practical advice, upon the fullest evidence, by men free from all bias in favor of the tenants. A famine and a rebellion came and passed. The population of Ireland was reduced from 8,000,000 to 6,000,000. A land agitation died out in despair. Men like Vincent Scully went down to their graves, leaving their tracts and writings as a legacy of brave but useless endeavors for reform. Another rebellion followed, and another famine. The population stood reduced to little over 5,000,000. Still persistent neglect of the recommendations of the report, or of the many other reports, and tracts, and treatises with which we were inundated. Between 1829 and 1869 twenty-seven bills and resolutions of a moderate character were offered by Irish members on the land question, and were every one rejected. And the conception of an Irish member settled down more and more into that of a well-dressed gentleman, who blarneyed his constituents on the hustings, lived pleasantly in London, gave his party as little trouble as possible, had an unbounded capacity for bearing snubs with equanimity, and secured as many situations as was possible for himself, his family, and his friends. Yet the land question involved the prosperity and happiness of the Irish people; and between 1830 and 1880 the Government found time to pass forty-nine coercion bills for Ireland. The Act of 1871, well intended as it was, was passed against the advice of the few able Irish members, and made matters upon many estates worse and more hopeless than before.

After the passage of the Ballot Act, an entirely new class of members began to be sent forward by the Irish constituencies—men who really felt with and represented the people. Between 1871 and 1880 thirty land-reform bills were brought forward by Irish members, most of them Liberals, and some Conservatives, and as usual met with no consideration. In 1879-80 there was again great misery and distress, the Land League was established, and in May, 1880, Mr. Gladstone came into power, as far as Irish support was concerned, upon expectations of radical land reform. None but Irishmen can realize the humiliation they felt at seeing the hat again go round the world on their behalf—knowing that even in the South Sea Islands collections were being made upon behalf of their country, and well aware that all the aid put together would not amount to one-tenth of the average annual sum added to the burdens of the tenants since the previous famine.

Commencing some years before the publication of the Devon report, and brought to a completion a few years afterward, a valuation of Ireland was carried out by the Government under Mr. Griffith, at the head of a large department and staff. It was upon this fact, that a careful and exhaustive scientific Government valuation of Ireland was coincident with a Government report which admitted that there should be legislation to prevent further usurpation of tenants' improvements, that Mr. Parnell based his demand that, until a fair and satisfactory settlement was arrived at, Griffith's valuation should be taken as the basis of a fair rent. Practically, the rack-renting protested against consisted of rises beyond Griffith's valuation, screwed out of the people upon their own improvements. Griffith's valuation of Ireland was £13,500,000. The rental in 1880 reached some £17,000,000. The depreciation in the value of money which had taken place in the interval must be remembered on the side of the landlords.

The treatment of the Fenian prisoners had no inconsiderable part in exasperating Ireland. Whatever American and late Irish developments have been, the original movement here sprang from pure and unselfish motives. It was wrong in that it could not succeed. The effort to degrade the leaders, many of them gentlemen of education and refinement, in the eyes of their countrymen, by subjecting them to penal servitude, failed in its intention and excited sympathy even in those who disapproved their policy. Silvio Pellico's and other records of suffering in Continental jails under the wors governments show how terrible imprisonment can be; but it is doubtful whether any system (not of actual torture) more essentially degrading and outraging to humanity was ever invented than penal servitude as carried out in British prisons and as applied to the Fenian prisoners. They were subjected not alone to cold and hunger, but to indignities in personal examinations and otherwise which cannot be named. Men like Mr. Davitt were chained to carts. These imprisonments extended over many years, and many who were released, and who have no sympathy with modern developments, are still, after eighteen years, in exile. The mass of the Irish people feel that the prisoners suffered for them, and the present generation at least will never forgive their treatment.

There was no reference to the Irish land question in the Queen's speech with which the new Government opened its career in May, 1880. Legislation was promised upon many subjects—"churchyards," "ground game," "liability of employers for accidents," and so forth. Justin McCarthy and other Irish members at first mildly protested. "Two or three lines couched in sympathetic terms" would have satisfied them. But they were not satisfied. Even sympathy would not at this point have satisfied others of less patient mood, and persistent neglect of the Irish land question at length culminated in an agitation that was all along predicted and might have been averted. The Government "Compensation for Disturbance Bill," wrung from them by the Irish members, was thrown out by the Lords; and the Government, instead of forcing its passage by a dissolution, as they would have done with an English measure of like importance, adjourned for six months' holidays, and hoped the Irish people would be patient till Parliament met in the spring. It is difficult to write with candor concerning the murders and outrages which disgraced Ireland during the following winter. The leaders and the mass of Leaguers were not responsible for those crimes. But did they put forth their strength to prevent them? Was the Irish land question never to be settled? Was there the least possibility of England giving her mind to its settlement in the absence of crime? Passion is strong; human nature is weak. Let any one who has ever felt deeply in a cause where crime is the inevitable outcome of the system he denounces, look into his heart and ask himself how he regarded outrages which perhaps almost alone insured reform.

In the session of 1881 a "Coercion Bill" took precedence of a "Land Bill," and we had a renewal of the scenes of the previous session in an aggravated form. The Government sought no assistance in the preparation of the Land Bill, either from the Irish party, who represented Irish feeling, or from Irish writers and economists, who had almost given their lives to the subject. It was to be the work of Mr. Gladstone and his colleagues alone; and the Irish people were to be indebted to him and them alone for its benefits. That it has conferred great benefits is true: a reduction of £162,000 per annum through the Land Court up till last May, besides, doubtless, a much larger sum by private agreement, through fear of its intervention, is no small reduction in 35,000 out of the 500,000 cases which might be brought before the courts. But the act has never approved itself to the best Irish thinkers, even outside the ranks of the Leaguers, as a statesmanlike settlement of the question, and its benefits have been obtained by an immense official and legal expenditure. The attitude of the Irish party toward the act was inevitable. The only possibility of wresting the full measure of benefit from it, administered, as it inevitably would be, by persons largely in sympathy with the landlords, was to decry as far as possible the merit of its provisions.

In the condition in which the Government of the country found itself in the autumn of 1881 much might be said in vindication of the policy of the arrest of the leaders of the Land League, but nothing for the general administration of the Coercion Act. In imprisoning Mr. Parnell and 800 associates Mr. Gladstone should have realized that he was not dealing with criminals, but with political opponents, and should have treated them accordingly. He owed it to himself to treat them with dignity, and the country was rich enough to pay for this. Their incarceration was, however, attended with the most humiliating circumstances, and as they were supplied with only prison fare, and as those who could afford it refused to live better than those who could not, a public subscription had to be set on foot for their maintenance; and when released, all the threads of Irish officialism were set in motion to injure their prospects for life *Væ victis!* I know the head master of a National school, taken up as a suspect, whose further engagement and chance of pension were cancelled. He is now in America. I know a Government clerk who was shut out from Government service. He now edits a "National" newspaper. These are but individual instances of what occurred in a large number of cases.

The Government, as upon all previous occasions of Irish revolt, appeared satisfied that it was dealing only with a set of foolish brawlers or criminals whom it had outbid in the affections of the Irish people. The "no rent" manifesto was a terrible blunder. The suppression of the Land League followed as a matter of course. An excellent opportunity for establishing a better feeling between the countries and for bringing the mass of the Irish people to the side of law and order, was thrown away next spring after the murder of the secretaries. The day after that crime was committed it was publicly denounced in the strongest terms by Parnell, Dillon, and Davitt in a printed manifesto scattered broadcast over Ireland. It was recognized as a crime against the best interests and hopes of Ireland, and aroused a feeling which might have been developed to any extent, but which was entirely arrested by the Coercion Bill introduced a few days afterward.

In the administration of that act, and the exercise of the power conferred, outrages upon common justice and public decency were inevitable, and will prove disastrous in the future. Ireland is ever being adjured to forget the past, while a present is ever being brought into a fresh bitter past to take the place of the old, even if the old were forgotten. Discussing yesterday with a gentleman much in the confidence of the Government, as to the possibility of inducing some of the Irish members to support a certain beneficial policy in conjunction with the Government, I was compelled to conclude that such agreement was at present impossible, principally owing to Mr. Forster's attack upon Mr. Parnell and the party last spring, and the attitude of the Government toward them after Carey took his seat in the witness chair. The Government and people of England then seemed convinced that

Mr. Parnell and his party had been working with the Invincibles. The baselessness of this accusation has been proved, but no amend has been made. That in a conflict such as the one carried on by the League proffered assistance could be selected and supervised, was impossible; that very many League branches became centres for all the virulent political animosities and private hates of the country, is perhaps true; that funds loosely and freely scattered over the country sometimes fell into bad hands, and may have been applied to doubtful purposes, is quite possible. But that Mr. Parnell's intentions or interests lay in a league with crime, is impossible. The officials in Dublin Castle privately acknowledge the imputations of last spring to have been unfounded. They know that a plot was on foot to assassinate Mr. Parnell himself by some of the very men with whom he was accused of having been in league for the perpetration of assassination. In thus endeavoring to explain the present feelings of Irish Nationalists we must admit that while we can understand, we cannot approve or excuse, their failure in the main to acknowledge, appreciate, and develop the wise and genuine sympathy for their country undoubtedly shown by many members of the Liberal party and many individuals throughout England.

Four great lessons are emphasized by the modern history of Ireland: (1) Justice cannot safely be denied or delayed. (2) Popular passions cannot for any purpose be safely roused by popular leaders beyond a certain point. (3) Permanently beneficial changes in the laws cannot in this age of the world be affected through individual force and mob violence. (4) It is no longer possible, comfortably, to govern any well-defined portion of the world in defiance of the prejudices and wishes of the majority of its inhabitants. Irish history, past and present, is in truth a tragedy. The more one studies it and has personal knowledge of its details and the actors, the more one yearns toward the country and its inhabitants. No personal sacrifices in any class would be too great that would hasten a settlement. The chaos of highmindedness and of meanness, of daring and of cowardice—the universal muddle, so to speak—is more striking the more one becomes cognizant of the facts. No chaos, however, can last forever, and each step toward order is so much gained. D. B.

JAMES'S PORTRAITS OF PLACES.

PARIS, January 3.

I CONFESS a great partiality for the writings of Henry James: his field of observation is large, and he is a good observer. So far, American novelists have dealt chiefly with American subjects. Mr. Henry James had a very happy inspiration when he endeavored to bring into close and daily contact the representatives of the New World and the representatives of the Old World. All his books might bear the title of an 'International Episode'; and in all we look for this curious chemistry of human atoms, formed under dissimilar circumstances and meeting in singular combinations. The old saying of the Greek philosopher, "Know thyself," always holds good; but in order to know ourselves well, we must not always look in our familiar glass—we must throw ourselves out of our usual life, rub against the world and try its hardness, leave our nest and look for other nests.

Mr. James has a great ambition: not only has he undertaken to bring into contact two branches of the same great race—the American and the English—he has thrown his Americans in the midst of France, and looked on the result. Gay-Lussac was once showing an experiment to some Royal Highness, and said, "These two gases will have the honor to combine before your Highness." The French gas, if I may say so, is very much opposed to such combinations. An American, well read, cultured, intelligent, will find himself at home at once in England. "Il y entrera," a Frenchman would say, "comme dans ses souliers." Of course he will find many things different from what he has seen at home; his feeling of "every man as good as another" will be constantly offended. But if he have any *esprit*, he will know that there are always limitations to this axiom; the limitations may be ideal—they may be material. The clerk at some great shop in London who whispers, "There is some carriage company," on the entrance of a lady descending from her barouche, has not the same sense of these limitations as has the lady who tries an unknown neighbor at some dinner-table. But no American of any sense, even if he is not above twenty, will really be much surprised in England at some of the manifestations of social inequality, because they are connected with things he knows and has heard about—with politics, with law, with wealth, with historical associations familiar to him. A man can hate privileges, but it is something to understand what they are made for and on what they are founded. It is something to have the key of a cipher—to know in virtue of what fact, what solid, tangible fact, one man will take precedence of another, one woman of another. There are, of course, mysteries of all sorts connected with this old English Constitution. It stands like an old manor, covered in places with ivy—like those castles which Henry James describes so well in his 'Portraits of Places'; there are hidden corners, rooms left empty, silent staircases, dark passages. But the manor is visible, and though it is not in our modern style, we may admire it—we may even come to cherish it.

A cultivated American, the most cultivated American, will find that France is to him more difficult to understand than England. To be sure, France is a democracy, and it would seem as if an American knew something about democracies. But the French democracy is something very different from the American democracy; they have hardly anything in common, except those abstract principles embodied in declarations of rights. Your American, if he lives long enough in France, will find that the French ideal of liberty is surprisingly different from the American ideal—that while equality reigns supreme in the text of the law, it has no place in the daily relations of life; and what will be a perpetual puzzle to him will be to trace the origin of the social inequalities. He will here have to deal with invisible forces, not with visible marks of power; he will feel, so to speak, in a land of ghosts. Names which have no meaning for him will be the objects of veneration, almost of awe; high-sounding titles will be treated with contempt. He will see wealth despised and poverty honored; foot or cab company preferred to carriage company, not in drawing-rooms, but in shops and among the lowest people. He will look for a standard and he will find none. If he works very long and very hard, he will come to the conclusion that manners are perhaps the greatest social forces; he will see that the French people are extremely sensitive on this point—that bad manners are a crime: the relations of man to man, whatever their station may be, must be conducted in a kindly, humane manner. But where shall he find the code of manners? There is none. The secret of good manners is that they must essentially be natural, they must be a part of the person. The smallest effort vitiates the relations of society.

It is the great merit of Mr. James's French stories that he has perceived this great influence of manners in French society. He has understood that there is a certain philosophy in a sociability which is often considered merely frivolous and superficial. A human life can only be filled in its depth by a very limited number of passions and affections; our inner life belongs only to a few; why should others expect from us more than an amicable disposition and an outward show of complaisance? The outer life ought to be, if possible, cheerful, amiable, kindly; the drama of life should remain hidden in conscience—it need not appear on the surface. There is no peculiar virtue in gloom, no excellence in silence, no wisdom in disdain. The danger of the Anglo-Saxon writer, when he deals with French character, is of falling into caricature; and it may be that Mr. James has not always escaped this danger. It is almost impossible that it should be otherwise, for the Frenchman makes *bon marché* of himself, as we say—he is easily familiar, indiscreet. I speak of the *petit bourgeois* of the cities; I do not speak of the better class, nor of the peasants, who are invariably reticent and cautious. Balzac must always be read with care by the student of French society, for he has painted almost every side of France; he has shown us not only Paris, with its men of fashion, great ladies, witty journalists, vulgar financiers, but also the humble, puritanic lives of the provinces. His wide sympathies discovered worlds unknown not only to the traveller, but to the Parisian, the scholar, the man of the world.

I have read with much pleasure, in Henry James's 'Portraits of Places,' the account of his ramblings in Rheims, in Laon, in Chartres, in Rouen, at Étretat; but surely he will forgive me if I have turned with more curiosity to the English and the American scenes in his book. I have sometimes heard countrymen of his accuse him of having become too English; I was struck, on the contrary, in his pictures of English life, by the independence of his judgment. Is there an Englishman who would dare to describe the ignoble "saturnalia" of a Derby-day as Henry James has done? The picture is true to the life; the contempt which the colossal vulgarity of the scene inspires in the American writer becomes almost eloquent. Perhaps he is too hard on the men and women of the lowest orders; he forgets that all the vulgarity of an Epsom day is not in the populace, nor in the *ring*; he forgets the tribunes, the young or young-old lord, the guardsmen, who are the models, the admired types, of the gaudy, carnal, middle-class, opulent young men. Mr. James's theory seems to be that in an old, aristocratic country, elegance, propriety, decency become a privilege. Alas! the privilege is not always used. The eldest son who mortgages the paternal acres, or sells collections which have been handed down to him by his ancestors, in order to satisfy the caprices of one of the Titianesque females whom Mr. James so well describes, or in order to pay a stupid and colossal bet, is, to my mind, more absolutely vulgar, and is certainly less excusable, than the licensed victualler who leaves his gas-lit shop and spends a day at Epsom, enjoying himself in the only way suited to his intellect and his appetite.

There are some very good and profound remarks in the chapter, "An English New Year"; the sentiment which binds the English middle classes to the sovereign and to the royal family is well analyzed. It is not quite a "humorous" view to say that "people in the immense obscurity of that middle class which constitutes the bulk of the English world, like to feel that they are related in some degree to something that is socially great"; for that "something" is not only socially, it is also nationally, great.

I find the true 'American' in another passage of the same chapter, in the description of some charity children on Christmas Day. There is something almost pathetic in his picture—"the dying wintry light in the big, bare, stale room; the beautiful Lady Bountiful, standing in the twinkling glory of the Christmas-tree; the little multitude of staring and wondering, yet perfectly expressionless, faces." These hundreds of charity children, living in an atmosphere of hunger, are evidently not a sight to which an American eye is accustomed. Is there a connection between the workhouse and the peerage? I will not touch the problem here.

If ever my good fortune should bring me back to the United States, Mr. James has not inspired me with a very ardent desire to see Saratoga. The picture of it, as a picture, is very striking. I have met occasionally, at watering places in Europe, in hotels in Switzerland, the people whom he describes, who are living abroad as they do at Saratoga, in a sort of splendid social isolation—the men, who have, even during their holiday, their minds full of the pursuit of wealth, of "corners," of speculations; and the women, who show off the fine dresses that are the result of these speculations. This sort of thing, as they say in England, is not peculiar to Saratoga nor to America; hotel life is everywhere imbued with it. Watering-places are not the places where people should form their ideal of life. I cannot, however, blame Mr. James for showing things as they are. The highest mission of the literary man, in a democratic country, consists in raising the standard of excellence by his writings. To this mission Mr. James has always been faithful. He has not bought success by an ignoble weakness; he is, by excellence, a *gentleman* of letters. He has seen many lands and many people, and he has taken his honey from many flowers; but he will remain a true friend of his own country if he defends it in future, as he has done in the past, against the worship of wealth, against vulgar imitation, against brutal sensuality, against the follies and vanities of communities where these follies and vanities are a legacy of the past.

Correspondence.

THE "NINETEENTH CENTURY" REPRINT.

To the Editor of The Nation:

Sir: We have just seen in your issue of January 3, in an advertisement from "The English Publishing Company," a statement to the effect that, having completed arrangements with us, the company will reissue the *Nineteenth Century* Review in America, simultaneously with its issue in England.

Other Reviews are named, and we do not know if the statement as to them is correct, but so far as we are concerned it is absolutely untrue. We have made no arrangements with the English Publishing Company.

The Review cannot be published in America simultaneously with the appearance of it in England, unless the whole is telegraphed, as no copy or advance sheets leave or will leave England till after the publication in this country. Pray be so good as to insert this unqualified contradiction.—We are, sir, yours faithfully,

Kegan Paul, Trench & Co.

London, 1 Paternoster Square, January 17, 1884.

AN INDEX TO NILES' REGISTER.

To the Editor of The Nation:

Sir: Some of your readers are perhaps competent to express an opinion on the probable usefulness of an index to *Niles' Register*, and the probable demand for such an index. That newspaper will always be a valuable source of information, as every student of economics understands. I have often wished that some one would compile an index to it, and I have gone so far as to consider the expediency of undertaking the task myself. J.

San Francisco, January 12.

["The proposed index would certainly be very useful to historical students," is the opinion of one of this class to whom we have submitted the above.—Ed. Nation.]

MR. RUSSELL STURGIS AND THE CESNOLA COLLECTION.

To the Editor of The Nation:

Sir: In the reports of the Feuardent-Cesnola suit, session of the 20th of December, General di Cesnola is quoted as saying, in answer to questions by jurors, "Russell Sturgis is mainly responsible for Gehlen's repairs and restorations."

I have written to General di Cesnola, calling his attention to this report and begging him to contradict it, supposing, as I must, that his words have been incorrectly reported. But, as I am so far away, I cannot well await his answer before taking other steps to contradict the statement ascribed to him. For that statement is wholly untrue. I never had anything to do with any of Mr. Gehlen's work upon the sculptures of the Cesnola collection.

At the time of the unpacking of the first Cesnola collection I was a Trustee of the Metropolitan Museum of Art, and a member of the Executive Committee. The Douglas mansion, in West Fourteenth Street, had been hired for the Museum, and I had volunteered to superintend the alterations necessary to fit that house and its appendages for the uses of the Museum. For this purpose I visited the house three or four times a week, and during all the time that I was so employed General di Cesnola was busy unpacking and arranging his collection, "the first Cesnola collection," as it is commonly called. He had assumed the charge of its arrangement in the Fourteenth Street building, and, to the best of my remembrance, was busied in that long and arduous task all through the later spring and summer of 1872, for perhaps four, perhaps five months. Mr. North, and afterward Mr. Gehlen, were employed in cleaning, repairing, and mounting statues, busts, etc. I seldom saw them at work, as I had but rarely any occasion to pass through their workshops, my own especially undertaken duty keeping me at the Museum building already too long. I seldom saw any statue or bust until after it had been put in place. As regards the repairs or restorations, the mounting and placing of the sculptures, I often conversed with General di Cesnola, exactly as any other member of the Board of Trustees might have done. But I never had given to me, nor assumed, any authority over these matters. I never directed any repairs, nor advised any, nor influenced, nor sought to influence in any way, the manner or extent of repairing or restoration. And the statement copied above from the *Tribune* of the 21st December is absolutely and wholly false.

I have made a similar declaration upon oath before the Consul of the United States at this place, and have sent it to New York, where it can be used if needed. R. Sturgis.

56 Via del Prato, Florence, Italy, January 4.

CABINET OFFICERS IN CONGRESS.

To the Editor of The Nation:

Sir: As to the *Nation's* dislike to controversy, to which "S. M. C." refers, I fancy it depends upon the kind of controversy. I can bear witness that for many years, and in a most long-suffering spirit, it has given me a liberal portion of space for the riding of a "hobby" in respect to the Cabinet officers, and I am sure it will maintain the same attitude toward any serious discussion of problems of politics involving the welfare of the nation. As to shirking the responsibility of forecasting the effect of the measure in question, considerations of space alone were taken into account. "S. M. C." will please note that I am quite prepared to fill an entire number of the *Nation* with such forecasting. Fortunately, the need of such a catastrophe is averted by the able letter of Mr. C. A. Towne, which I trust has received "S. M. C.'s" careful consideration.

If your correspondent has really no desire to see any relief of what he happily calls the "paralysis of functional efficiency" in the Executive or Legislature, there seems to be no common ground between us, as that is the only purpose for which I advocate the change in the position of the Executive. I judge from his letters that he is one of those who wish to neutralize and get rid of all government as far as possible. This idea is confirmed by his suggestion that the Federal officers should be made elective, which must raise a shudder in any one who knows how that process operates in the Eastern States and cities, whatever it may do in Iowa. I hold that more efficient, coherent, and systematic government is an absolute necessity, whether for the nation, the States, or the cities, and that the first step toward this is a change in the relations of Executive to Legislature. If the result is not desired, *cadit quæstio*. Certainly our present methods are admirably adapted to produce the opposite result.

Is the means adapted to procure the end? From regard to space, and for that reason only, I will throw out the Continental governments, where the people have not yet learned to enforce their will, and turn to the only government besides our own where the people really have a will—Great Britain. Certainly it is now in a state of great embarrassment, but that is caused by the Irish members. The Irish question has forced itself to the front, and if it takes twenty-five years to get that question peacefully settled, to the exclusion of everything else, the time will not have been wasted. The Irish Church and the Irish Land Acts were wonderfully difficult and complex pieces of work, irrespective of results, and were obtained by Executive and Legislature working together. They may fail, but at least they will be tried, and if they do fail it will be for the Ministry to guide Parliament to the next step. The burning question in the Extended-Franchise Act, to come up this winter, is its extension to Ireland. The real hesitancy is in the conflict of public opinion. Whether the Tory or Liberal view gains the upper hand, the Ministry in Parliament must be the means of reducing it to definite shape.

But, to judge the case, a larger view must be taken. Parliamentary reform, Catholic emancipation, tariff reform, municipal reform, the Education Act—these and many others have been the results of a strong Executive Ministry acting upon Parliament. "S. M. C." wishes to see a fixed and stable civil service. If he will study English history, he will find that this reform was forced by Lord Palmerston upon a reluctant Parliament; and if we ever get it in effective shape, it must be forced by a strong and popular Executive upon a reluctant Congress. Observe, too, that even now the finances in the hands of the Chancellor of the Exchequer flow on quietly and without disturbance. The country is not thrown every year into convulsions of terror as to what a chaotic Parliament,

worked by a powerful lobby, may or may not do.

Turning homeward, I concede to "S. M. C." that we cannot "recall any scheme of overt statesmanship since the war, planned by either President or member of the Cabinet, the failure of adoption of which has been a serious harm to the country." But the trouble is that there has been no such scheme at all, unless in the general terms of a message hustled by Congress, with some thousands of other propositions, into the dark closet of a committee room. And it is just the want of such schemes which has done harm to the country. There is no need of specifications in saying that the state of our finances is disgraceful. Whether we need a navy or not may be a question, but there can be none as to the pitiable condition of that which we have. Common justice required that after the war the wealth and intelligence of the North should have done something to ameliorate the condition of the South. What we did or did not do needs not to be told. Meantime, the whole civilized world regards Washington as a sink of corruption—wrongly no doubt, as what looks like such is mainly helplessness and want of leadership. If "S. M. C." likes that state of things, I do not, nor, I believe, does the country at large. At all events he cannot rightly point to English recent parliamentary history as a justification of it. G. B.

Boston, January 26, 1884.

RIGHTS OF MINORITY STOCKHOLDERS.

To the Editor of The Nation:

Sir: In the *Nation* of December 27, attention is called to attempts that have been lately made in England to guard better minority rights in joint-stock organizations, and one of the plans that have been partially tried there is explained.

Permit me to suggest another plan, which would be more effective, and which, moreover, would be easier of application, because based on a simpler, as well as a juster, principle. It is this: Let each stockholder have one vote as a *person*, and then one vote for each share of stock he owns in his own right, whether it be one or a thousand shares. Thus, *e. g.*, suppose the stock of a company to be divided into 500 shares, of which one person shall own a majority, say 300 shares, while the other 200 shares—a minority—shall belong to 200 persons, each owning one share. Now if this company, when incorporated, should covenant that each member should have a vote as a *person*—or as a man and a member of the organization, without regard to the quantity of stock he held, precisely as he would have in a corporation with no capital—and also that he should be entitled to cast a vote for each share of stock he owned, there would be:

Personal (or manhood) votes	201
Share (or stock) votes	500
Total	701
Number of votes to constitute a majority	351

Under the operation of such a principle, the owner of the majority of the stock—300 shares—could not fail to observe that the minority had rights that even he would be bound to respect. Henry D. Barrows.

Los Angeles, California, January 10, 1884.

To the Editor of The Nation:

Sir: In your issue of the 10th inst. I note a communication from Edward McCrady, jr., on the "Voting Power of Stock," in which he advocates, as securing a full and fair representation of all the stockholders, "a mononomial plan of voting," whereby each share should have a vote for but one director, and each director would be voted for separately. He states that if a road had 18,000 shares, owned in eighteen towns, and there were eighteen directors, any one of the towns, by securing a thousand shares, could secure one director, and thus have a share in the management of the road.

In the management of drainage districts and the directorship of mining companies, under the Constitution of California of 1879, a similar result is secured, more clumsily and less perfectly, by the cumulative vote, under which each shareholder has as many votes as there are directors to be elected, which he can distribute or concentrate, as he may see fit; that is, he can put in his eighteen votes for one man, or divide them among as many as he pleases. School directors in England are elected by this clumsy process, which, however, secures a better representation of the whole than either the district system or electing candidates at large. It works so well in California that what was first enacted as a law after some years of experience was embodied in the Constitution.

Mr. McCrady's plan is the same as that advocated by Émile de Girardin, many years ago, for all elections—one vote for one candidate, and no local limitations. Girardin, however, did not suppose it would secure proportionality, and perhaps it would not have done so in France at that time; but, after a careful study of political phenomena, I am fully satisfied that it would secure proportionality with us to-day, though in the elections to Congress State boundaries would be of course recognized, and New York State would secure proportional representation in Congress, while the status of Delaware would be the same as at present.

Much damage has been done to this and to other methods intended to make a Legislature a miniature, in opinions, of the voting body, by designating these methods as "minority representation," thus leading persons who have no time or inclination to look further to conclude that the design is to deprive majorities of the control to which they are entitled. It is probable that, but for the use of this misleading term, one or more States would to-day elect their Legislatures on this principle, as Illinois does its lower house by the cumulative vote in districts returning three members each.

As instancing the absurdity of the present system of government by parties, witness the tariff question; see the vast amount of "straddling" done by the Democratic party. There are numerous Democratic protectionists and Republican free-traders, revenue reformers, etc.; yet the platform of each party pretends to represent the views of all the members of that party. Under proportional representation, there would be no such nonsense, as, instead of two parties to represent so great diversities of opinion on every subject as there must be among all intelligent men, there would be several *groups;* and while on any proposed *measure* there would be a majority and a minority, on some other measure the majorities and minorities would often be composed of entirely different persons. Caucuses, primaries, and all the corrupt addenda of modern politics would be thrown off by the *vis medicatrix naturæ* of the body politic thus given a chance to act when a candidate represented about so many votes, just as a dollar represents so many cents.

Alfred Cridge.

Station "B," San Francisco, January 16, 1884.

THE GOVERNMENT AND PUBLIC EDUCATION.

To the Editor of The Nation:

Sir: In his interesting article on "The National Government and Education," in the February number of *Harper's Magazine*, Mr. Charles F. Thwing makes several misstatements of fact of sufficient importance to demand correction:

First, after mentioning the first reservation of land for schools under the land ordinance of May 20, 1785, he says:

"This act was, a little more than two years after, included in the ordinance of 1787, which provided for the government of the Northwest Territory. The motive prompting this liberal grant to the public schools is expressed in the declaration of the ordinance that 'religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall be forever encouraged.'"

The ordinance of 1787 covered a different subject from that of 1785, contained no reference to the latter, and alluded in no way to a grant of lands for schools. The ordinance of 1785 was superseded by an Act of 1796, while the ordinance of 1787 remained in full force until 1802, and portions of it even until to-day. As to the motive prompting the grant, if space permitted it could be shown that if it must be traced to one motive, that one was the desire of Congress to sell the Western lands as rapidly and for as large a sum as possible, in order to pay off the public creditors. The desire to offer every inducement to migration, and to meet the demands of intending purchasers, more than the desire to foster education, was what first led, after the bill had lain before Congress for nearly a year, to the insertion of the clause making the reservation for schools (see Pickering's 'Life of Pickering,' I., 509-511).

Second. Mr. Thwing says: "Since its establishment, the Government has appropriated the public lands or their proceeds to the extent of 140,000,000 of acres to new States for educational purposes." The Report of the Public Land Commission in 1880 shows (Part 4, pp. 223-230) that the total grants of lands for educational purposes to June 30, 1880, amounted to 78,659,439 acres. To these are to be added the so-called "internal improvement" lands of six States, amounting to 3,000,000 acres, and the proceeds of about 2,000,000 acres in those States to which Congress has given for education 3 per cent. of the sales of public lands within their borders. This gives a total of about 84,000,000 of acres or their proceeds, instead of 140,000,000 "appropriated for educational purposes."

Third. Another passage says: "The history of the relations of the general Government to public education proves that it has aided the cause by grants of lands, by proceeds of the sales of lands, and by direct gifts of money." If this statement means that the national Government has ever made an appropriation of money for public education, it is not true. If, however, as is probable, Mr. Thwing had in mind the distribution of the surplus revenue in 1836, he has distorted the facts in calling it a "direct gift of money" in aid of education.

According to the Act making the distribution, the surplus revenue was to be "*deposited* with the several States" which should pledge their faith "for the safe-keeping and *repayment* thereof . . . whenever the same shall be required by the Secretary of the Treasury" (5 U. S. Statutes, 55). A year later it was provided that the money should "remain with the States until otherwise directed by Congress." Congress has never recalled these deposits, and probably never will, and several of the States have, as Mr. Thwing says, credited their proportion to the common-school fund. But the action of any individual State in using for educational purposes funds which, when deposited with her for safe-keeping, were designed to be recalled at some future day, does not change the intention of Congress, nor does it warrant the statement

that in depositing this money with the States the national Government made a direct gift of money in aid of education. Especially is this statement open to objection when it is used as a precedent for an appropriation of money at the present time.

GEO. W. KNIGHT.

ANN ARBOR, MICH., January 23, 1884.

THE LATE PROFESSOR SOPHOCLES.

TO THE EDITOR OF THE NATION:

SIR: In No. 966 of the *Nation* there is a sketch of the life and character of the late Professor Sophocles, of Harvard. Notwithstanding his well-known dislike to the publication of what he called "biographical nonsense," it is no wrong to him to add a few particulars relating to his early life. They serve to show more exactly the occasion of his coming to America, and how slowly he was led to adopt this country as his home.

While yet a boy he left his native village in Eastern Thessaly, and accompanied his uncle to a convent at Cairo in Egypt, a branch of the convent on Mount Sinai. There he spent several years, engaged principally in the study of the Greek Classics. He went back to Thessaly in 1820, and entered a school of high character at Melea under the management of Constantes, Anthimos, Gazes, and other teachers of repute. Gazes, distinguished for his 'History of Greek Literature' and his 'Lexicon of Ancient Greek,' had passed twenty-five years of eminent usefulness as a teacher and author in Vienna, and had just returned to Melea, his birth-place, full of zeal for the education of his countrymen. The next year, 1821, the war for Greek Independence broke out, the school was closed, and Sophocles again found a home in the convent at Cairo, where he served as librarian. He visited also the parent monastery on Sinai, but at length withdrew from association with the monks, though remaining in friendly relations with his uncle.

Returning to the Greek Archipelago, where the disorder and poverty of war still prevailed, he resumed study under his former teacher, Gazes, now quite feeble, who was revising his Lexicon, and supporting himself by teaching a few pupils at his house. A missionary of the American Board, Rev. Josiah Brewer, visiting the island of Syra in September, 1827, called on Gazes and found that his family consisted of only three—himself, a niece, and his pupil, Sophocles. The next winter Count Capo d'Istrias, formerly a pupil of Gazes at Vienna, became Governor of Greece. His kind attentions gave new life to his old preceptor, who consequently moved to Ægina, the seat of the provisional government, and was appointed to some educational service. Mr. Brewer went up from Syra in the same ship with Gazes and his party. "Your father ὁ μακαρίτης," said Professor Sophocles to the writer, "was the first American that I ever became acquainted with. It was he who invited me to come to America." This proposal, made in Ægina, met with the concurrence of Gazes, who rejoiced that his Thessalian disciple could have opportunities of study beyond what Greece then provided. An educated Greek, with a knowledge of English, would have good prospects of usefulness to his countrymen. No one seems to have thought of his passing his life in America. At this time his mother and sister were living in Thessaly, and his uncle, Constantius, in the convent. His own baptismal name was Sophocles, but he then signed himself Evangelinos Sophocles, having assumed the name of his grandfather. He was previously known to many as Sophocles Magnes or Thessalo Magnes, from the region of his birth.

Sophocles accompanied the missionary from Ægina to Smyrna, where they were joined by two other Greek youth. They arrived at Boston July 15, 1828, and Sophocles was sent to school to Mr. Colton, at Monson. To acquire our vernacular more rapidly, he began at once to write translations of the simple passages of the 'Græca Minora.' Latin, which he had never studied, and English were the two foreign tongues on which he fitted for college.

He long cherished the hope of returning to his native country. In 1834, while teaching mathematics in the Hartford Grammar School, he wrote with earnestness of his purpose. Late the next year he asked his friends in Greece to seek a situation for him, as he was ready to come. Perhaps the breach which then occurred between the Greek clergy and the American missionaries may have made his American education and American testimonials more of a prejudice than a help to his application. In 1837 he published one or two pamphlets of exercises in modern Greek; the next year he gave his 'Greek Grammar' to the press, and with this literary venture he seems to have settled his thoughts on a career in America. The two nations to which he belonged find in his life-work one of the multiplying ties which bind them together in sympathy and mutual respect.

FISK P. BREWER.

GRINNELL, IOWA, January 18, 1884.

Notes.

A. S. BARNES & CO. will publish, in a limited edition, a life of the late Ezra Cornell, now being prepared by his son, the ex-Governor of New York, Alonzo B. Cornell. The same firm have become the publishers of Jenkins's admirable 'Vest Pocket Dictionary' and 'Handy Dictionary.'

In May next, A. D. F. Randolph & Co. will publish Dr. Mombert's edition of Tyndale's Pentateuch of 1530, now for the first time reprinted in separate form, collated with the edition of 1534, in the Baptist College, Bristol, England, with Matthew's Bible of 1537, the Biblia of Stephanus of 1528, and Luther's Pentateuch of 1523. This edition will be further enriched by the Marginal Notes of Luther and John Rogers, as a contemporary commentary, and Prolegomena by Dr. Mombert. The English copy at Bristol excepted, the Lenox Library has furnished the whole of the rare apparatus used in the production of this work, the first of the kind published in America.

Ginn, Heath & Co., Boston, will publish next month a 'Sanskrit Reader,' with vocabulary and notes, by Professor Charles Rockwell Lanman, of Harvard University; a 'Manual for the Study of Latin Grammar,' by E. T. Tomlinson; and 'Stories of the Old World,' by the Rev. Alfred J. Church, in their "Classics for Children" series.

Mr. Blaine's forthcoming work will be entitled 'Twenty Years of Congress.'

'Ballades and Verses Vain' is the Spenserian title which Mr. Andrew Lang has chosen for the volume of poems soon to be published by Charles Scribner's Sons, uniform with his 'Helen of Troy.' Mr. Lang has prepared this selection of his poems especially for his American readers, and it will contain the best of the 'Lyrics and Legends of Old France,' and of the 'Ballades in Blue China,' besides certain of the poet's later verse. It will have four divisions, Ballades (of which there are thirty-six), Verses Vain, Post-Homerica, and Translations. In the preparation of the volume Mr. Lang has had the aid of Mr. Austin Dobson, who has also written for it two of his pleasant bits of verse.

Harper's Magazine, like the *Century*, has its artist abroad engraving directly from the old masters. Mr. W. B. Closson's first fruits will appear in the March number, the subject being from Murillo.

The city authorities of Boston have sanctioned the publication of a second edition of the document entitled 'Rededication of the Old State House, July 11, 1882.' Mr. Whitmore has slightly lengthened his address by inserting the details of one rather important crisis in the history of the building, and has been able to add another to the remarkable series of views which preserve the successive aspects of the old State House for a hundred years. A new plate, showing the west end, and two fresh heliotype views of the restored legislative chambers, further distinguish the present from the former edition. The authorities have now wisely ordered the work to be stereotyped, and it ought indeed to take its place among the regular prizes in the common schools. For the promotion of an intelligent civic pride, such a distribution would be of far greater value than the annual award of medals under Franklin's foundation.

J. R. Osgood & Co., Boston, publish the American edition of collected essays by Henry James, under the title of 'Portraits of Places.' The range is from Venice to Niagara. England receives most attention, next France, then America, and finally Italy. We have gladly ceded criticism of this work to our Paris correspondent, all the more as a number of its chapters appeared originally in the *Nation*.

The *Literary News* (F. Leypoldt) completes its attractiveness as a family paper by adding to its many-sided survey of current literature for adults a special department of "Current Literature for the Young," edited by Miss C. M. Hewins, with the assistance of Mrs. Leypoldt. This appears in the form of a supplement, and can be had separately for five cents a copy—a cheap enough guide to distracted parents. Special attention will be given to Sunday-school books.

With the new year, as usual, come a host of new periodicals. The *Bay-State Magazine* (Boston: Bicknell, McClintock & Co.) is designed to interest Massachusetts citizens or descendants wherever encountered, just as the *Granite Monthly* addresses itself particularly to the sons of New Hampshire. Like that elder periodical, too, it places a biographical sketch, with a portrait (of Marshall Wilder) in the forefront. Ex-Mayor Green contributes a paper on the "Old Taverns and Stage Coaches of Groton"; the chief editor, Mr. T. W. Bicknell, one on "The Family Immigration to New England." Gen. H. B. Carrington "develops" the siege of Boston with the aid of a map. The rest of the contents is readable, and the magazine may easily make a place for itself, one would think.

The *Auk* (Boston: Estes & Lauriat) is new chiefly in name, being, as we have already announced, the continuation of the *Bulletin* of the Nuttall Ornithological Club, in the interest of the new American Ornithologists' Union. It opens with descriptions of several new birds from Santo Domingo (one of which is pictured in a colored plate), by Charles B. Cory. Walter B. Barrows, on the other hand, tells about the birds of the Lower Uruguay, and Leonhard Stejneger of a new species of woodpecker from Kamtchatka. Long Island is not neglected. Prof. Augustus C. Merriam and Dr. Elliott Coues have a bout over the philological part of the latter's 'Check List.' The magazine shows a marked gain in fulness and interest.

Mr. Charles A. Peverelly continues his journalistic devotion to sport on the water by issuing the first number of his *American Aquatic Magazine* (New York: Hearne & Co.).

Mr. R. Verea begins, at No. 29 Ann Street, *El Progreso*, a monthly illustrated periodical, having a generous regard for "todos los conocimentos humanos."

In the *Medical News* for January 12 will be found an article of exceptional interest on the expert testimony in the Dwight insurance case, by Dr. Horatio C. Wood. This case is almost romantic in its appearance of fraudulent suicide.

In the December number of *Le Livre*, Champfleury chooses the title, "The Friends of Balzac," to prove that this great author had none, in the sense in which the head of a school has his set of admirers and hangers-on; and to make a home thrust at Gavarni, who was intimate with Balzac, for his plain-spokenness concerning the personal habits of his intellectual superior. An historical article on "German Caricature," by J. Grand-Carteret, who professes to have undertaken a task neglected by the Germans themselves, is not uncivil to the masters of the Rhine, furnishes much curious information, and is illustrated by a large number of specimen designs, of which one occupies a full page. The January number shows a number of typographical improvements in this always handsome magazine, though a sure taste does not yet preside over the choice of head and tail-pieces. Here the most interesting of the leading papers is one on Lamennais as a critic and bibliophile, by Eugène Forgues. The material is rather scanty for the thesis, but it is all interesting, even if the nature of Lamennais's library is left very vague; and a good many hitherto unpublished letters do show how he regarded the works of his contemporaries, and what an impression, for example, Sue's 'Wandering Jew' made upon him. A striking portrait of the author of the 'Paroles d'un Croyant' accompanies the article. Among the announcements is one to the effect that General Trochu, who has long been eclipsed by changing events in France, is giving the finishing touches to an important work on the siege of Paris.

In the *Revue Historique* for January–February, H. Adams has a very interesting article on Napoleon I. and San Domingo, bringing out the First Consul's scheme of making this island the connecting link between the mother country and Louisiana—the key, in short, to the colonial system of France. Mr. Adams prints from the Archives a large number of letters relating to Leclerc's campaign and perfidy to Toussaint, and even takes part with the Consul against the Emperor, by upholding the original scheme against Napoleon's apologetic and historically unfaithful exposition of it at Saint Helena. But at its best this particular *idée Napoléonienne* can only be judged by an Anglo-Saxon critic as essentially a product of the geographical deficiencies of the French intellect. Take, for example, the First Consul's diplomatic excuse to England for reënslaving the blacks of San Domingo, that "if their liberty were once recognized, it would furnish the Republic of the United States with a *point d'appui* for all time." This is comical, when we recall the alarm with which our slaveholding Republic witnessed emancipation in the British West Indies in 1834–38, and its refusal to recognize the independence of Hayti at the latter date. Amusing, too, in a sad way, are the official reports of Toussaint's keepers at the Château de Joux, concerning his failing health. One says he called in neither doctor nor surgeon, since, owing to the total difference in the constitutions of negroes and Europeans, it would have been useless. Another explains that he was never asked by Toussaint to call in one. Still another relates: "Il y a trois jours qu'il fut assez impudent pour me dire qu'en France il n'y avait que des hommes méchants, injustes, calomniateurs (ce sont ses termes), de qui l'on ne pouvait obtenir justice."

Italy's "prima colonia," Assab, at the lower extremity of the Red Sea, has lately been visited by Prof. G. B. Licata, and pronounced highly flourishing. He brings back, says the *Bollettino* of the African Society of Naples, a great mass of scientific observations on that salt-making neighborhood, with botanical, zoölogical, and mineralogical collections. Meteorology, linguistics, and ethnology were also regarded.

Trübner & Co. send us the first numbers of the fortnightly *Revue Internationale*, the latest "iron in the fire" of the indefatigable Professor Angelo de Gubernatis. They bear date of December 25, 1883, and January 10, 1884, respectively, the place of publication being Florence. In his somewhat grandiose preface, the editor pictures the *Revue* as a peace-offering among the nations—more particularly, it is inferrible, between Italy and France. He disclaims any intention of rivalling the *Revue des Deux Mondes*. His scheme embraces original articles, translations, book reviews, literary correspondence; and is unlike any other ever before launched. Thus, Dr. von Holtzendorff discusses the creation of a chair of international instruction at the University of Rome; Professor G. Giuliani, Dante and the Duomo of Florence; Laveleye, the division of parties and the parliamentary régime in Belgium. Max Müller writes of Rammohun Roy, the famous Indian religionist of a generation ago. The Princess Dora D'Istria relates the legend of Rurik. F. Antony deals with the contemporary drama in Italy. President Opzoomer writes on Hugo Grotius. Jules Claretie adds one more laurel to Victor Hugo's wreath. Dessewffy contributes three poetical translations from Petöfi. The special correspondence is certainly very extensive, and in good hands. As yet the United States seems unprovided for. Miss Helen Zimmern promises an article on Nathaniel Hawthorne. The *Revue* is well and tastefully printed.

The *Antiquary* for December contains several entertaining articles on "Pepys as a Citizen," "May Fair," "Two Old Country Residences,', etc.; and there are two short papers of considerable importance in the history of institutions. That upon "Borough English"—*Ultimogeniture* it is called by some writers—is a very good summary of the various theories that have been advanced to explain the origin of this usage; but it contains no positively new information. Mr. Hubert Hall's paper upon "Early River Conservancy" is probably the most important in the number; it treats of the "common" rivers, which "were of even greater importance to the trader of olden days than the well-worn high road or boggy lanes of the overland route." In speaking of the provisions said to have been made in certain indentures of apprentices, that salmon "should not be set before them on more than three days in the week," he remarks: "no indentures of this kind have ever been discovered, . . . nor . . . will any such ever be forthcoming. The whole tale is a myth, for salmon was always the most costly species of the whole finny tribe. Some day, perchance, students of folk-lore may discern that the story was an elaborate sarcasm current among masters at the expense of the proud stomachs of their 'prentices." Bewick, however, who had been both apprentice and master, referring, in his autobiography, to his own boyhood (in 1760 to 1767) and the then cheapness of salmon, says: "Before, or perhaps about this time, there had always been an article inserted in every indenture in Newcastle, that the apprentice was not to be obliged to eat salmon above twice a week, and the like bargain was made upon hiring ordinary servants." The same story is common in various places in this country, and we should be glad to know if any such indentures or regulations are actually in existence.

The 'Almanach du *Figaro*' has the same easy wit and easy morality to be found in the *Figaro* itself, and also the same flavor of purchasable praise which disfigures that paper even more than most of its Parisian contemporaries. Some of the illustrations are process-blocks printed in two colors—an art in which the French excel—and the others are printed in color on a page of letter-press in black. But neither the art nor the literature is remarkable except for its flippant levity. What we found in it most amusing was the advertisment of an American bar in Paris, with recipes for a "meint jalep" and a brandy cocktail. In the construction of the latter the French artist employs "sirop de gomme" and curaçoa.

In a recent number of the *National Review* Mr. Henry Blackburn had a paper on "The Art of Illustrating Books." It was calculated a little too closely for the meridian of London, and therefore did not reveal any close comprehension of the American advance in wood-engraving. Especially was it wanting in its treatment of the new "processes" which are now adequate to the execution of much of the most characteristic work in the American magazines. This process-work is generally puzzling to English critics. The *Saturday Review*, for example, praised the drawing and the engraving of the illustrations in Mr. Howard Pyle's 'Robin Hood,' and only suspected that they were the work of "the so-called typo-etcher," while the *Academy* devoted itself to a consideration of the quality of the engraving, which it found rather German than American, and some of which it inclined to believe to be due to Mr. Pyle himself. Of course all American readers saw at once that every cut in Mr. Pyle's admirable book was "processed"—to use a new verb invented to fit a new thing—just as the drawings of Mr. Abbey and Mr. Parsons in illustration of Pope's poem, in the Christmas *Harper*, were also "processed."

It has long been suspected that several of the small planets are of variable brightness, and Ferguson more than thirty years ago made observations with reference to this point. While one of the brightest of these planets, Vesta, the fourth in the order of discovery, was near its stationary point in 1883, Professor Harrington, of Ann Arbor, made a series of photometric observations, comparing it with two of Argelander's stars near by, the one being fainter and the other brighter than Vesta—from which he concludes that the planet's light is variable. As a result of his own observations and other considerations mentioned, it seems probable that Vesta is a body about 500 miles in diameter, and that it resembles the moon in lacking an appreciable atmosphere and water. To account for the observed irregularities of the planet's light, it may be presumed that it rotates on its axis, and that the surface is very rough. The period of Vesta's rotation is not indicated, but the rapidity of the changes in its light leads to the conclusion that it is short. What is true of Vesta may be regarded as likely to be true, *mutatis mutandis*, of the other small planets—a sizable family of bodies in the solar system our knowledge of which is chiefly confined to data of precision relating to the orbits in which they move, and the physical characteristics of which must remain almost entirely unknown.

—We have received from Geo. A. Leavitt & Co. a copy of the catalogue of the library of the late Henry Cruse Murphy, of Brooklyn, to be sold by them on March 3 and the following days at Clinton Hall. This library consists almost wholly of

Americana, or books relating to America. A brief sketch of the life of the collector, penned by a friendly hand, makes a fitting preface to this volume. Mr. Murphy was born in Brooklyn in 1810, graduated from Columbia College in 1830, and gained admittance to the bar in 1833. He filled the offices of Attorney, Counsel, and Mayor of his native city, was four years a member of the National Congress, twelve years a Senator in the New York Legislature, and four years United States Minister to the Netherlands. He was a journalist of repute, and among the historians of the early settlement of New Netherlands his name fills the leading place. His title to fame rests upon solid foundation, and not alone on his public services as a legislator, diplomat, and civic ruler, but mainly upon his love of books. This catalogue of his library, a carefully prepared work of four hundred and thirty-four pages, describes in upwards of three thousand numbers some of the rarest books that ever came under the auctioneer's hammer To select *the* gem of the Murphy collection would be a hazardable undertaking. At a venture, however, we have picked out the 'Jesuit Relations' as likely to take the lead in the biddings. This nearly matchless set comprises forty-two volumes, of which thirty-six are original editions. To bring these Relations' together was a work of Mr. Murphy's life. "In the great book-markets of London, Paris, Leipsic, and Amsterdam, his agents were constantly on the lookout for volumes, and it was only through this constant watchfulness that this remarkable set was made." The "Columbus Letter," a precious tract of three leaves, printed at Rome in 1493, is a thing for any possessor to be proud of. Its English title would be something like this: "Letter from Christopher Columbus (to whom our age oweth much) concerning the Islands of India beyond the Ganges, recently discovered, in the search of which he was sent eight months ago under the auspices and at the expense of the most invincible sovereigns of the Spains, Ferdinand and Isabella . . . translated from the Spanish into Latin the third day of the calends of May, 1493." Five thousand francs is the price marked in a late Paris catalogue for a copy of this "excessively rare" tract. Brotherhead's 'Centennial Book of the Signers,' with autograph letters of the signers of the Declaration of Independence added, together with portraits, views, etc., make up a volume of great interest and value. A note to this title informs us that "some twenty years since a less perfect, and in every way inferior, collection of original letters of the signers only was sold at auction in New York for a thousand dollars." Thirty-seven numbers of the catalogue describe as many editions of the 'Cosmographia' of the "divine" Ptolemy, twenty-six bearing dates from 1462 to 1600. The edition of 1462 is a marked one because of its date, and for a century and more has been a standard puzzle of bibliography. The learned agree that the date (1462) is false, but they disagree as to the true one, some favoring 1472, others 1482, and others 1491. Mr. Murphy was inclined to fix it at 1482, and we cannot gainsay so high an authority. Another edition, printed in 1535, is interesting on account of the name of its editor, Michael Servetus, the martyr. It is an historical fact that a passage from this edition of Ptolemy, stating that Palestine was not such a fertile country as people generally believed, since modern travellers related that it was entirely barren, was the foundation of one of the charges brought against Servetus, for which he suffered at the stake.

—The pages of the catalogue fairly sparkle with the names of Vespucius, Verrazzano, De Soto, De Bry, Hakluyt, Lescarbot, Strabo, Peter Martyr, etc., and it can truly be said that scarcely one of the old-time voyagers and geographers has been left out. Eliot's 'Indian Bible' and his 'New Testament' take up five numbers of the catalogue These are the masterpieces of American printing in the seventeenth century. The "Marquis of Hastings's copy" comes into the list, and for this identical book Mr. Quaritch, the London bookseller, received $1,100. Other Eliot titles are 'Tears of Repentance,' and three distinct works relating to the 'Progress of the Gospel among the Indians in New England.' The Mathers, Increase and Cotton, are here in twenty examples; and so are Thomas Morton, with his 'New English Canaan'; G. Mourt, with his famous 'Relation'; Thomas Welde, with his 'Short Story of the Rise, Reign, and Ruine of the Antinomians'; Roger Williams, with his 'Key into the Language of America,' etc., etc., in strange print and rich binding—a hoard of "nuggets" to gladden the eyes and lighten the pockets of bibliomaniacs from far and near. The numerous curious notes scattered through the catalogue make the work doubly serviceable to those into whose hands it will pass. Some of the notes are attributed to Mr. Murphy himself, and those by the maker of the catalogue exhibit a close acquaintance with many branches of literature.

—Mr. George W. Cable, in the February *Century*, calls attention to the evils of the convict-lease system in the Southern States. The following is his description of the system:

"Its features vary in different regions. In some, the State retains the penitentiary in charge of its officers, and leases out the convicts in gangs of scores or hundreds to persons who use them anywhere within the State boundaries in the execution of private enterprises or public or semi-public works. In a few cases the penitentiary itself, its appliances and its inmates, all and entire, are leased, sometimes annually or biennially, sometimes for five and sometimes for ten or even twenty years, and the convicts worked within or without the prison walls, and near to or distant from them, as various circumstances may regulate, being transferred from place to place in companies under military or semi-military guard, and quartered in camps or herded in stockades convenient to their fields of labor. In two or three States the Government's abandonment of its trust is still more nearly complete, the terms of the lease going so far as to assign to the lessees the entire custody and discipline of the convicts, and even their medical and surgical care. But a clause common to all these prison leases is that which allows a portion, at least, and sometimes all, of the prisoners to be worked in parts of the State remote from the prison."

The result is, of course, that the treatment of the convicts depends altogether upon the humanity of the lessees, overseers, or bosses who work them, and the result is a very high convict death rate in some parts of the South. Thus in North Carolina, among convicts working on the railroads, in 1879 and 1880, 178 died out of 776, or 11½ per cent.—a rate, says Mr. Cable, greater than that of New Orleans in the great yellow-fever year of 1853. Of these 178, no less than 11 were shot down in attempting to escape—a fact that reveals the severity of the discipline which the overseers find it necessary to maintain. They seem to be worked somewhat as the Roman convict gangs used to be two thousand years ago, and it is very significant of the general tone of the civilization which the South has inherited from the old ante-war times, that it is only just now that the attention of Southerners is beginning to be awakened to the pagan barbarity of the system. As Mr. Cable very justly says, no Christian community has any right to treat human beings in such a way. It is responsible for its convicts, and is charged with a duty a little more delicate than that of letting them out to be worked by brutal lessees and washing its hands entirely of them. Of course, the system results in its being very difficult to get at the facts with regard to many of the States, as, for instance, the following correspondence with the Arkansas lessee shows:

"OFFICE OF LESSEE ARKANSAS STATE PENITENTIARY, LITTLE ROCK, ARK, Jan. 12, 1882.

"DEAR SIR: Your postal of request to hand; sorry to say cannot send you report, as there are none given. The business of the Arkansas State Penitentiary is of a private nature, and no report is made to the public. Any private information relative to the men will be furnished upon application for same.

"Very respectfully,
"ZEB. WARD, Lessee.
"Z. J."

"OFFICE OF LESSEE ARKANSAS STATE PENITENTIARY, LITTLE ROCK, ARK., July 2, 1882.

"DEAR SIR: Yours of——date to hand and fully noted. Your inquiries, if answered, would require much time and labor. I am sole lessee, and work all the convicts, and of course the business of the prison is my private business. My book-keeper is kept quite busy with my business, and no time to make out all the queries you ask for. Similar information is given to the Legislature once in two years.

"Respectfully,
"ZEB. WARD."

—Mr. Cable calls for the substitution of the Northern contract or State-employment system; but, unless we are greatly mistaken, the problem is not so simple as this solution would seem to make it. Is it not seriously complicated with the race question? Mr. Cable's statistics do not discriminate between black and white, but probably the convicts employed on the railroads and in other manual labor in gangs are, to a large extent, blacks who have been accustomed to labor of this sort, and are better fitted for it than for making shoes, stoves, or hats. The mere fact that convicts in the South are worked in gangs is not therefore enough. It is how they are worked, how much they are worked, the character of the food they are given, and the discipline that they are subjected to that need investigation. Mr. Cable brings forward facts enough to show that the Southern convict system needs overhauling; but the inference that the reader would naturally draw—that nothing more is required than the abolition of leases, and the substitution of the Northern system of contracts—is misleading. A lessee can be held in check and made to work his gang properly, just as well as a contractor. In fact, a short lease of the labor of a gang of field-hands is in principle the same thing as a Northern shoe contract. Constant State supervision and publicity are evidently much needed, and nothing is better adapted to bring them about than the publication of articles by Southerners who feel the inhumanity of such features of Southern life.

—*Harper's* contains an illustrated article on "A Winter in Canada," by C. H. Farnham. The writer finds in Canada what all Americans find there—a civilization in complete contrast with their own in two essential points. Repose and good manners pervade the simple life of the Canadian French. "Your feelings," says Mr. Farnham, with a naïf humor, "are as safe as your life." It is, moreover, a different sort of politeness from that which we meet with in Upper Canada, though this again, as a change from our system, is refreshing. Old-fashioned courtesy, strictly speaking, it is difficult to find in the United States, except in certain parts of the South—Virginia, for instance—where in little antique oases may be found fine specimens of what we feel must have been the best manners of the last century. The caricatures of these in the newer Southern and Southwestern States should not be confounded with the genuine and now very scarce Virginian—or Southern—man-

ners. This survival, however, is confined to a small class, and bids fair to be soon repudiated altogether by the new Southern school, which feels toward the old rules of breeding much as the Mahones of the South do toward the old fancy about the binding nature of a pecuniary obligation. But in Canada we find ourselves in the midst of the traditions of another race, another language, and another religion, and get much further back into the past—two centuries instead of one. Nor is it among a few superfluous veterans that the old atmosphere is preserved. The atmosphere of Canada seems to know no change. The Quebec of to-day is the Quebec of Wolfe, and the Seigneur of the lower St. Lawrence, if he cannot claim feudal services, still has a seignory, and still lives among a simple-minded peasantry, benighted enough to connect his social position in some way with their religion. In the Easy Chair, Mr. Curtis returns to the "society news" question, and deals with it carefully and judicially; but he mistakes our position, and attributes to our views a dependence upon those of Mr. Richard Grant White, while we regard them as so independent of his that, even had he never written a line about the true aristocracy of America, they would have been forthcoming, expressed with boldness, yet not too boldly. Our position is this: Jenkins was a snob; Society News differs from the snob quite as much as the society of the Jenkins period differed from the society of our day. Mr. Curtis seems to insist that society is unchanged; but how can this be, when its change is reflected in Society News? Snobbishness is a sort of tribute paid to real social virtue by hypocrisy; and Jenkins was something of a hypocrite. But brazen effrontery is the chief "note" of Society News. He is a vulgar ruffian who gets under our sofa to overhear the orders we give our cook, hides behind our curtain to get at the "bottom facts" of our private family life, or who receives orders from vulgarians a little wealthier than himself to "notice" properly the supplies of coal they are distributing to the poor, or the cost of the "lay-out" for the great fandango which is to get them into society. Jenkins is disappearing, just as snobbishness is disappearing.

—The February *Atlantic* has an article by the Rev. O. B. Frothingham, called "Voices of Power." The pulpit, the press, and the stage are the three voices of the modern world on whose power he especially dwells. Admitting that the position of the clergyman is not what it once was, that the foundations of his authority have been sapped by the progress of modern thought, he still insists that he has a function to perform which neither the newspaper nor the drama can take from it. The introduction of the drama seems to confuse matters a little, for it cannot be said that the drama, ancient or modern, ever showed any signs of a tendency to usurp the attributes of the pulpit, and, indeed, we cannot see exactly what the two have to do with one another, while there is undoubtedly a rivalry in a certain sense between the pulpit and the press. Both, in Protestant countries, aim at influencing public opinion, and though the secular press shows very little interest in matters of dogma or sectarianism, it continually exhorts, holds up moral standards, discusses the moral aspects of social and political questions, and has a most important influence upon the general moral tone of its readers. Mr. Frothingham objects to the newspaper code of morals that it is "conventional," as distinguished from that of the pulpit.

"It appeals to the general conscience. It rarely soars above its occasion, or leaves the beaten track of conviction. The paper assumes the average moral sentiment of the community—the highest average sentiment, certainly—and is compelled to be, in substance, commonplace. It cannot diverge far from accepted principle, for by so doing it would be unfaithful to its leading purpose, which is to enlighten the minds of its contemporaries, not directly to elevate their consciences. It takes existing laws of duty for granted, follows the road of tradition, and, however fresh and forcible it may be in expression, abides by conceded examples. Now and then an editor ventures on original theses, indulges in speculative lucubrations, or propounds ethical theories beyond his calling. But this is felt to be out of his province, and is set down to the account of some private eccentricity. The task of uplifting the souls of men is committed to other hands, and if intrusted to him alone would hardly be fulfilled. To him belongs the office of the interpreter, not that of the prophet. Unquestionably, his influence may be great in extending the sphere of the pulpit, in holding the preacher to the level of his vocation, in distributing moral forces, but his power to originate them is small."

By what he says later on, it appears that he means by this that newspaper morality is limited by business considerations. A paper must pay a fair interest on the invested capital; and consequently must provide the kind of morality that the public like to buy. But there is really not so much difference between press and pulpit here as might seem at first sight. A modern church represents a certain amount of aggregated capital contributed voluntarily for the purpose of getting a certain amount of exhortation or exegesis, of music, of devotion, prayer, and praise. If the moral part is not to the satisfaction of the congregation, the clergyman is nearly as apt to find himself left without an audience as a newspaper. The voluntary principle in religion produces just the same effects that business principles do in the newspaper, and we doubt very much whether newspaper morality is on the whole more commonplace or limited than that of the pulpit. The pulpit has one great advantage over a large part of the press, so far as morality is concerned, which Dr. Frothingham does not mention—that it does not have to provide its audience with "spicy" news in addition to exhortation. Notwithstanding this, we think the secular press may fairly "claim" for its editorial page that its appeals to the public conscience are worth as much, appeal for appeal, as those of the pulpit.

—We have received from President Anderson, of the University of Chicago, a letter in regard to Dr. Clevenger substantially the same as that which we printed last week from another correspondent. President Anderson adds:

"We endeavor to teach here all that belongs to science, in every department of investigation. We make, and intend to make, a sharp distinction between science, that which is really known, and hypothesis. We teach both, but we mean to call each by its appropriate name."

—From the forthcoming volume of the Census Reports, relating to wealth, debt, and taxation, we learn that the estimated true valuation of the country upon June 1, 1880, was 43,642 millions of dollars. This estimate can, from the nature of the elements which enter into it, be but an approximation to the truth, and this fact is sufficiently indicated by the *roundness* of the figures in which the result is expressed. Still, it is probable that the truth has been much more nearly reached than ever before. The following table shows the valuation in 1880, 1870, 1860, and 1850, as given by the reports of the Census of those dates, with the percentage of increase from one date to another:

	Valuation in Millions.	Per cent. of increase.
1850	7,136	.....
1860	16,160	126.4
1870	24,055	48.9
1880	43,642	81.4

The valuation in 1850 is unquestionably an under-estimate, as is indicated by many considerations, which cannot, however, be discussed here. It should be remarked, too, that the valuation in 1870, given in the Census report of that date as $30,069,000,000, was expressed in currency, which was then at an average discount of about 20 per cent. The amount given in the above table is the gold value, and this value was used in computing the percentage of increase between 1860 and 1870, and 1870 and 1880. Moreover, the value of several millions of slaves, which formed a very notable part of the wealth in 1850 and 1860, disappeared in 1870. It is estimated that the value of this species of property was, in 1860, not far from $1,250,000,000. The loss of these slaves and the ravages of war diminished the property of the Southern States enormously, reducing them from the wealthiest States, in proportion to population, to the poorest.

—It appears that wealth has, during each decennial period, increased much more rapidly than population, as is further shown below:

Years.	Valuation per capita.	Per cent. of incr. of valuation per capita.
1850	$308	..
1860	514	67
1870	624	21
1880	870	39

The following are the principal items of wealth, with the estimated value of each in millions of dollars:

Farms	10,197
Residence and business real estate	9,881
All real estate exempt from taxation	2,000
Railroads and equipment	5,536
Telegraphs, shipping, and canals	419
Live stock, farming tools, and machinery	2,406
Household furniture, clothing, paintings, books, jewelry, household supplies of food, fuel, etc	5,000
Mines, etc., with one-half the annual product	781
Three-fourths the annual product of agriculture and manufactures, and of imports of foreign goods	6,160
Specie	612

This estimate places this country at the head of all the nations of the world in accumulated wealth, if we accept the estimates of Mulhall ('Balance Sheet of the World') as being correct in regard to other countries. Its nearest competitor is Great Britain, which, according to this authority, had in 1880 a valuation of 43,366 millions. France was an easy third, with 35,898 millions. Then followed Germany, with 29,403; Russia, with 17,134; and Austria, with 14,762 millions. It may be of interest to note here that Mulhall estimates the wealth of the United States in 1880 at 7,880 millions of pounds, or 38,139 millions of dollars—an amount absurdly small. Then, from this and the Census valuation in 1870, which is taken at its value in *paper*, he deduces the discouraging fact that wealth has increased at a lower rate than population during the past decade, which, as is well known, has been, on the whole, one of unexampled prosperity. The following note appended to Mr. Mulhall's estimate ('Balance Sheet of the World,' 2d ed., p. 31) has a curious sound to the American reader: "The Census returns just published are 25 per cent. over this figure, but perhaps the lands have been overvalued." It is not apparent where Mr. Mulhall obtained the figures indicated in this note, as the estimate with which this article opens is the only one made public by the Census Office.

—The extracts from the Diary of the Marquis Tsêng, recent Chinese Ambassador to England and France, translated by Mr. J. N. Jordan, and published in the December number of the *Nineteenth Century*, give some curious views of the estimation in which the civilization of Europe and America is held by an Oriental scholar. With the true instincts of a patriotic Chinaman, he seems to have measured and estimated everything from its resemblance to something in

the history of his own country. Nothing appears to have met with his approval except when he was able to find its prototype and its favorable influence in some early dynasty. In his opinion, "the ascendency of Western nations is due, not to the extent of their wealth, but to the sympathy which exists between the people and the governing classes, and in this respect they are exemplifying the maxims of China's sages of old." The belief is expressed that "the systems of government and civilization prevailing in the West bear a close resemblance to the institutions of China in the Chow dynasty." He even goes so far as to say, "it is plain that all Western institutions have existed in the past in China." When the objection is raised that steamers, steam-engines, etc., were unknown in past ages, his answer is ready: "By such an assertion the fact is ignored that mechanical ingenuity depends upon material resources, and varies according to a nation's prosperity or decay. In olden times China had no lack of mechanical appliances, but, as her national prosperity gradually declined, her people fell into idle and thriftless habits, and mechanical arts gradually died out. As by a glance at what Europe now is we may see what China once was, so by noting what China now is we may learn what Europe will one day become." But notwithstanding the apparent superciliousness of these views, the Marquis is inclined to what his countrymen would call a most liberal policy. He relates that just before leaving Shanghai he met Chang Huan-lun, "a young man of great promise and extraordinary attainments," who submitted to the Ambassador six propositions "which," in his opinion, "evince such originality of thought and such depth of insight, and are so different from the random assertions one often hears," that he reproduces them. They are: (1) the necessity of contracting a firm alliance with England, for the purpose of repelling Russian aggression; (2) the importance of adopting an honest and straightforward course of policy in our international relations, with a view to removing feelings of mutual distrust; (3) the advantages of embracing every opportunity of meeting Western scholars, so as to profit by their intercourse and conversation; (4) the advisableness of keeping ourselves informed from time to time of the price and quality of Western mechanical appliances, so as to avoid falling victims to fraud in purchasing them; (5) the translation of treatises on foreign systems of government, with a view to the adoption of what may be found useful therein; and (6) the arrangement, in the interests of China, of some satisfactory understanding with England for the stoppage of the opium traffic. The first of these propositions the Marquis could not accept in its entirety, and concerning the sixth he anticipates difficulty in securing such a solution as is there indicated. The views expressed in the remaining ones agree in the main with the opinions he has always held. It is also of interest to note that his belief is unqualified that a mistake was made in establishing the "Educational Mission" in America. Far greater advantage, in his opinion, is to be derived by China from the education of youths in the Government schools in Peking and Canton than from sending them to be educated either in Europe or in America.

—M. Clermont-Ganneau communicates to the London *Times* the news of an interesting find made in the Lebanon Mountains by M. Pognon, Assistant Consul of the French Republic at Beyrout. He vouches for its genuineness, having at his disposal the original documents, just laid before the Académie des Inscriptions et Belles-Lettres by the Orientalist, Barbier de Meynard. M. Pognon, his admiring countryman tells us, has had the good luck to discover in one of the wildest valleys of the eastern slope of Lebanon, about two hours from Hermel, a village near the Orontes, two inscriptions of King Nebuchadnezzar. They are engraved on the rock, and placed opposite each other on the right and left of the pathway occupying the hollow of the valley. They measure a little over five metres in breadth, and about half as much in height. One is in an archaic and the other in cursive cuneiform characters, both together forming nineteen columns. Each inscription is accompanied by a basso-rilievo. One of the images is that of a person wearing the Assyrian tiara, and seizing an animal, possibly a lion, standing on its hind legs; and the other represents a man in adoration before a tree. Each inscription begins with the titles of the King: "Nebuchadnezzar, King of Babylon, the illustrious pastor, the servant of Merodach, the great lord, his creator, and of Nebo, the illustrious son, whom his royalty loves." In other respects the texts differ. They mainly contain an account of buildings which the King is having constructed in Babylon. Some of the contents is a reproduction of texts already found elsewhere. The inscriptions are badly mutilated—in fact, "in a deplorable state of obliteration." The discoverer does not think that they indicate a place where the Babylonian conqueror passed with his army; he believes they mark the site of a timber-yard where trees were cut to be sent to Babylon. This agrees with a formerly-discovered inscription of the same monarch, which says "that he has employed for the woodwork of the Chamber of Oracles the largest of the trees which he has conveyed from Mount Lebanon." In reference to the use by ancient princes of the cedars of Lebanon, M. Clermont-Ganneau makes some very interesting remarks and comparisons of a learned character, but he forgets to quote that Biblical "proverb against the King of Babylon"—evidently the same Nebuchadnezzar, although the words are contained in a chapter ascribed to the much older Isaiah (xiv.): "Yea, the fir trees rejoice at thee, and the cedars of Lebanon, saying, Since thou art laid down, no feller is come up against us."

—That composite weekly, the *Journal Général de la Librairie*, etc., lately published in its *Chronique* the address of Alexandre Dumas to the electors of Seine-et-Oise in 1848. It was worthy of the great inventor. In 1848 the workman was supreme. To them, therefore, the candidate recommended himself as a fellow-workman and a benefactor of workmen. "Without counting," he says, "six years of education, four years of notaryship, and seven years in office, I have labored twenty years at ten hours a day (73,000 hours) in composing 400 volumes and 35 dramas. Four thousand copies, on an average, were printed of the volumes and sold at five francs apiece—11,853,600 francs. The 35 dramas were played 100 times apiece—6,360,000 francs." He then goes on to state how much his novels have produced for various classes of workmen—compositors, 264,000 francs; pressmen, 528,000; paper-makers, binders, booksellers, engravers, circulating libraries, expressmen, etc. And his dramas similarly have brought such and such sums (which he displays in a long column carefully added up) to the directors, actors, decorators, costumers, hairdressers, bill-stickers, machinists, ticket-sellers, firemen, musicians, and so on, including, of course, the poor, who by law have their five per cent. of the receipts. With all this, Dumas was not elected. The workmen cared nothing for these material benefits. Perhaps if he could have appealed to those who had profited in another way by his writings, those who had drawn not francs but enjoyment from them, the result might have been different. The companion of D'Artagnan through the eight volumes of his adventures would not have turned a cold shoulder upon his historian. Even now, when we are told that a new generation has grown up which knows not Dumas, we fancy he could find a sufficiently numerous constituency. At any rate, his lately-erected statue was warmly greeted.

EXCURSIONS OF AN EVOLUTIONIST.

Excursions of an Evolutionist. By John Fiske. Boston: Houghton, Mifflin & Co. 12mo, pp. 379. $2.00.

AMONG our thoughtful essayists, there are none more brilliant than Mr. John Fiske. His pure style suits his clear thought. He does not write unless he has something to say; and when he does write, he shows not only that he has thoroughly acquainted himself with the subject, but that he has to a rare degree the art of so massing his matter as to bring out the true value of the leading points in artistic relief. It is this perspective which makes his work such agreeable reading even on abstruse subjects, and has enabled him to play the same part in popularizing Spencer in this country that Littré performed for Comte in France, and Dumont for Bentham in England. The same qualities appear to good advantage in his new volume, which contains his later essays on his favorite subject of evolution. Most of them (if not all) have already appeared in the magazines, but they are well worth reperusal in a permanent form.

The papers fall mainly into two groups—those concerning the evolution of primitive man in Europe, and those concerning the evolution of Protestantism there—with a few scattering but cognate essays on hero-worship, Darwin, Clifford, etc. The first chapters, on the arrival of man in Europe, give the best popular account that we have seen of that interesting subject—the only one, indeed, in which the preglacial remains in Portugal and California are fairly estimated. Some high authorities give less weight than Mr. Fiske to the theory of Croll, which connects our glacial period with perturbations of the earth's orbit some one or two hundred thousand years ago. Some of them prefer to set a nearer date for that period, and consequently for the appearance of that Arctic race of cave-dwelling men who accompanied it. But the expanse of time since man appeared is so great, on any of the computations now in scientific favor, as to stagger the imagination, and dull it with endless centuries of savagery. The exact length of those long periods in which humanity seemed to stagnate is not a very vital question, for we measure time by its accomplishment rather than the lapse of the monotonous years.

There is a good deal to be said in favor of the theory which Mr. Fiske adopts, that the "missing link," the ape man who first began to use flint weapons and live by his wits rather than his muscles, is to be sought far back in the miocene period, which was so prolific in new animal forms; though, in the absence of any remains but chipped flints and hacked bones, we cannot be sure of the degree of development then reached. The conditions evidently favored change; and variation, once begun, is apt to spread, as the botanists who are trying to make our flowers sport into new forms to-day are well aware. When variation really begins it is not hard to continue and direct it, for the previously unbroken force of heredity is partially counteracted. And so for a time we may well suppose

that this half-hatched humanity was plastic; that variations were abundant and important; and that the new and more intellectual form which the struggle for existence assumed, cooperated with a sexual selection more influenced by considerations of beauty than before, so that the new race progressed for a time at an exceedingly rapid rate. But by the time the period was reached to which we must refer the earliest discovered human bones, the remains of that extinct race of hunters who preceded the glaciers, and whom Mr. Boyd Dawkins calls the men of the river drift, we find a race which had taken the shape of humanity as we know it, but had apparently no power to develop its higher qualities. Natural selection seems to have become a static, not a dynamic power; preserving, but no longer improving man. It had roughly harmonized him with his surroundings in favored European spots, but it had done so in a way which weeded out any further growth there. And when the change of climate came, and these prematurely arrested men of the river drift died out, they left the country to the equally unprogressive but hardier coeval race of Eskimo cave-dwellers, who moved down from the North with the glaciers, and at last retreated northward with them, and still exist there with their primitive characteristics seemingly unchanged since the age of the mammoth.

This long period of savagery lasted for hundreds of thousands of years, according to Mr. Fiske's computation of time—a stagnant marsh of humanity without apparently one current of progress. The few thousand years of modern progress, compared with those interminable centuries of stupor which roll lifelessly back through the age of stone weapons, seem but the passing phase of a moment, like the waking of the Emperor Barbarossa from his magic sleep for an instant once in a century. No one can deny that we are now awake and are living in a period of rapid evolution; but just what relation it bears to the infinitely longer periods of rest or retrogression, neither Mr. Fiske nor Mr. Spencer has yet pointed out. All that we know is that some time after the final retreat of the glaciers, a great awakening of humanity did come in Asia. The European record only shows that after the restoration of a temperate climate the dark-haired Iberian wandered into Europe with his dogs and cattle and grain and pottery, bringing with him from the Orient the rudiments of civilization, and that the tall blonde Aryan, who after a time followed him and conquered him, had the same origin. Pursuing the line of philological argument suggested by Max Müller and others, Mr. Fiske reconstructs some part of the lost Aryan tongue, and derives from it a good deal of information of their customs and character. It is very interesting, but, from the evolution standpoint, one wants to go further, and learn how this strange new civilization arose, with the promise of all our modern progress. What raised this wonderful Aryan from the dead level of the dwellers of the cave and the river drift, and, like the leaven in the parable, gave lightness and life to the whole world? One or two things may be suggested. The discovery of the art of working bronze must have had some stimulating effect, but one must look deeper for a true cause. While fertile Europe stagnated in the hands of a single feeble race, at least three great ones were striving together in Asia: the ancestors of the Iberian, the Mongol, and the Aryan. Then the character of the country encouraged extensive migrations, and emigration is often a vigorous selection of the best stock, particularly when it is aided by the radical sexual selection which accompanies a disproportion of the sexes and a judicious intermixture of foreign blood; and it is favored and its fruits are preserved by new surroundings. The only two cases of marked race development that can be plainly traced in historical times are those of the Teutons in northern Europe and the Moors in Spain—both migratory tribes settling in a land more fertile than their own. But then, many Asiatic migrations come quickly to mind, like that of the Turks into Europe, which produced no such results, so that evidently some other elements must have been active with these to explain the awakening. Mr. Spencer's old suggestion of a rhythmic law of alternating evolution and disintegration Mr. Fiske has never given much weight to. Probably he recognizes in its notes more of the poet's music of the spheres than the anvil clang of modern science.

Toward the middle of the volume Mr. Fiske reprints his reply to the attack which Dr. William James made upon Spencer in the *Atlantic*, three years ago. Dr. James, it will be remembered, objected to the insufficient part which Spencer assigns to the influence of great men upon the progress of humanity; and Mr. Fiske speaks with his master's authority in his defence. The question of hero-worship is so much a matter of sentiment and of point of view, that it is safe to say that it will never be decided. If one is trying to give a dramatic and life-like picture of a past age—as Mr. Froude does, for example—he must perforce throw himself into the lives of its great men, and look at things through their eyes; and then a certain one-sidedness and short-sightedness is almost unavoidable, if one would keep up the illusion. On the other hand, if one is treating history scientifically, and looking not so much for facts as for the general laws which guide the centuries, exceptional men disturb the view, and must be passed over. In such works as those of Buckle, Lecky, or Spencer, the individual is of little importance, except as an illustration of average humanity. We are looking for movements of the mass, and have to ignore to a great extent the exceptions; just as in certain mathematical calculations, where it is important to find the true mean from a number of divergent observations, those which differ very widely from the average are disregarded, and only the nearer ones are combined to get the mean quantity which is to represent them all. The illustration is a misleading one, however, for great geniuses are not exceptional errors, which one can disregard; they are something more even than those brilliant spontaneous variations to which the naturalist looks for improved strains to preserve. They seem often to supply to the great world of thought an impulse which transforms it from stagnation to vigorous and sustained action; and so the question brings us back again to the forces which arouse or arrest evolution.

The essays upon Protestantism are those upon which there will be the most difference of opinion. It is natural that Mr. Fiske should look forward to the future triumph of his own liberal but extremely vague religious views; and the reader will notice that he accepts as satisfactory Mr. Matthew Arnold's still vaguer definitions of divinity. In discussing the causes of the old religious persecution, Mr. Fiske regards as insufficient the usual explanation—namely, that it sprang from the conviction that salvation was only to be won by accepting a particular creed, and that it was an imperative duty to do everything, no matter how extreme, to prevent the eternal punishment which followed unbelief. He attributes it rather to the hardness and cruelty of the times, and to the domineering habit of asserting one's own opinion as infallible, and especially to the feeling of corporate responsibility for the religious belief of all the members of the community—a survival of the savage notion that the gods will punish us if we suffer our neighbors to insult them. No doubt all these feelings had some effect, though perhaps not quite so much as Mr. Fiske attributes to them. The intolerance of imperfect civilization showed itself in many ways, which modern liberalism avoids; but the intellectual pretexts which men employ to defend or excuse their course do have a great effect upon the restraint they put on their acts, although the impulse generally comes from feeling more than from thought. There are other causes, too, that should be mentioned. The spread of practical utilitarianism, for instance, is such that we almost never punish any act now that does not tend to injure others. This is due partly to religious indifference, but more to a feeling that matters of mere opinion are beyond the province of government. It is not exactly a question of infallibility, for every legislator has to assume his own infallibility now as much as formerly when he passes a law, even if there is much to be said on both sides—as, for instance, about marriage with a deceased wife's sister or daughter. His duty compels him to punish those who follow a different rule from that which he lays down; for, on practical matters, some invariable rule must be enforced. But for a fuller discussion of these and many other interesting matters we must refer the reader to Mr. Fiske's pages.

MITCHELL'S HISTORY OF ANCIENT SCULPTURE.

A History of Ancient Sculpture. By Lucy M. Mitchell. With numerous illustrations, including six plates in autotype. Dodd, Mead & Co.

MRS. MITCHELL'S elaborate work has some qualities which render it a valuable addition to the series of works on the same subject that have appeared during the past few years. It is a résumé and study of what has been accumulated, which shows immense diligence and wide reading, and a conscientious getting up of the facts so far as studying museums and collating authorities will go; and the copious illustrating of it gives it a value as a popular book on this subject greater than that of any of its predecessors, so far as illustration can confer value. In the direction of references, while the authoress acknowledges her obligations to Brunn, she follows up her borrowings from the elder authorities by careful study of the occasional articles on the latest researches, so that the book becomes a dictionary of references to all that has been written on its theme.

It begins with the history of Egypt, and gives all the information of the early chronology and of the theological bases of sculpture which are attainable; runs through the eras of Egyptian art; then, taking Chaldæa, Assyria, Persia, Phœnicia, and Asia Minor—each of which divisions of the subject receives a short chapter—enters on the theme of greater interest to the artistic reader, of the "earliest art on Greek soil." For, in fact, sculpture as art, in contradistinction to that sculpture whose purpose was monumental and mnemotechnic, or literary, began with the Greek adoption of it. Archaic Greek sculpture occupies five chapters, followed by six on the age of Pheidias and of Polykleitos; these by eight on the age of Skopas, Praxiteles, and Lysippos; four on the Hellenistic age of sculpture, concluding with three on sculpture in ancient Italy and under Roman dominion. One of the most valuable features of the book is the copious appendix, giving 1,290 notes of reference, many citations from Greek and Latin writers, a general index, and tables of museums, indicating the works of the various epochs to be found in them—a product of great patience, if not always of entire exactitude.

Unfortunately, the confused and discursive character of the book greatly diminishes its popular utility, and its excessive diffuseness makes needless labor in the simple reading of it. A book on such a theme—dry at best and didactic if anything—should be condensed and orderly to the last degree, and the authoress had Müller's 'Ancient Art' as a model in which compactness and orderly arrangement are carried to the highest perfection, with the result of imparting all the certain information we possess of all the ancient arts, in less than half the biblical bulk of Mrs. Mitchell's volume. Such useless digressions as the historical passages, and the mythological—where, as in "The Aryan and Semitic Elements in Greek Religion," they have the faintest and most strained relation to sculpture—are in their aggregate a burden to the avowed function of the book; but when, as in the above case, they are completely misleading, and betray the want of balanced judgment which alone can deal with such uncertain themes, the misdirection of the reader is more than an offset to the slender information conveyed in the aggregate. The summary way in which the authoress dismisses, as put beyond debate, subjects on which the widest difference of opinion exists, only shows that she has herself given but little thought to them. The radical defect of her book, indeed, is the too ready acceptance of one side of any debated question, according to her having been taken by an ex-parte exposition of it. Thus, in the chapter named above, we read:

"The Pelasgians, according to tradition, worshipped at Dodona one highest God, Zeus, but without images [she might have added, that the priests of Dodona, on the same authority, are spoken of as saying that the gods are powers, for they know not their forms]. . . . Hesiod [who wrote centuries after the Dodonean simplicity of theology] tells of thirty thousand immortal watchmen of Zeus wandering through the earth doing his bidding; and it seems most probable that in the people's fancy the poet's great ethical host were polydemoniacal powers, lower in grade than Zeus and inherited from an Aryan ancestry, but giving rise in time to gods of higher standing. . . . Even Apollo and Athena must have been later and beautifully individualized members of this great host; but Aphrodite, we know, was a stranger imported from thoroughly foreign shores and peoples."

Now, so far as we have a right to "know" anything on this subject, the reverse is the case; Apollo and Artemis coming to Greece from Asia Minor, and Aphrodite being, by the authority of the same traditions, one of the earliest Pelasgic deities and most unjustifiably identified with Astarte. We have the genealogy in the Pelasgic legends as Zeus, Dione, and Aphrodite, then Eros. That the subject is abstruse, shadowy, and difficult to decide on, is true, but this is all the better reason why the authoress, who had no call to deal with mythology, should have avoided charging her already overloaded work with matter which should have been better digested in order to be printed anywhere, and which here is a positive drawback to the book.

The Phrygian tombs discovered by Mr. Ramsay, and which from their resemblance to those at Mykenæ have been objects of great archæological interest, the authoress disposes of with judicial briefness, and without reasons—"thus indicating clearly that the pattern of the Mykenæ tombs came from Asia Minor"; when the fact is, that, according to the opinion of Mr. Ramsay and the character of the work itself, it is most probable that the Phrygian work is centuries later than that of Mykenæ, and, if belonging to the same art, is a provincial and barbarous descendant of it. Of that much-debated subject, the necropolis of Mykenæ excavated by Schliemann, Mrs. Mitchell says: "That these tombs of Mykenæ have a greater antiquity than the encircling Cyclopean walls . . . is evident from their primitive build, . . . as well as from the fact that the Cyclopean walls, on reaching this circle, deviate from a regular line, etc., thus clearly indicating the earlier existence of the latter." But the truth is, that the indications all point to the opposite conclusion, showing beyond any cavil that the tomb was fitted to the previously existing walls, of which some fragments, as well as others of buildings of the Hellenic epoch, are employed in the construction of the buttresses which held up the barbarous stone-work of the tomb. Again, "Strabo calls the grottoes at Nauplia the work of the mythic Kyklopes." What he speaks of is the labyrinth, which is a subterranean work entirely different from the grottoes, which are common rock tombs, apparently of a poor class of people, and long posterior to the vaulted tombs of Mykenæ.

On p. 281, we read:

"There is much reason to believe, in consequence of comparisons made by modern study, that such fine archaic bronzes were not of Etruscan manufacture, but were imported from the Greek colonies in Southern Italy, and probably also from the corresponding cities in their parent lands, whence came, as already seen, even so great a master as Pythagoras of Samos. To this family of archaic bronzes of grand style from Italy, but far too noble to be of Etruscan origin, must belong such works as the famous Chimæra in Florence and the splendid Cortona lamp, full of the early Ionian spirit, despite their Etruscan inscriptions, which were doubtless scratched in afterward."

This shows in brief that the authoress misconceives the spirit of Etruscan art, besides being heedless of the weight of evidence. The Chimæra and the Oratore of the same museum are so entirely in the spirit of Etruscan art, and so far from any form of the Greek—even Mykenæan—that there is no excuse whatever for attributing them to Ionian influences or origin.

In general, the 'History of Ancient Sculpture' shows a want of digesting power. There is no gauge of the value of information or opinion, and the crudest and least-founded attributions seem to have as much value as any other. There seems to have been no effort to collate and weigh adverse opinions, where they exist. This absolutely destroys the critical value of the work, and, in fact, leaves it little better than a mass of notes collected with great diligence and perseverance, and, in general, with the most frank and unbiassed intentions, but which, for want of critical acumen, conclude nothing and cannot be admitted as an authority in matters of art or archæology. If it had been limited to the nominal scope—the purely historical—it would have been a more useful book, because smaller and more trustworthy as a guide; for its historical element is, in general, based on good authority. The authoress enters into needless æsthetical considerations, which are sometimes idle and sometimes false. She seems to have adopted the German bases for all her conclusions; but, admirable and sound as are the Germans as scientific authorities, and wherever patience and minute research will carry them, in æsthetical conclusion—in all matters, in fact, which pertain to the regions of pure art and artistic judgment—we do not accept their dicta as of the least authority.

Humor, Wit, and Satire of the Seventeenth Century. Collected and illustrated by John Ashton. J. W. Bouton.

HARDLY any method is observable in the arrangement of the contents of this scrap-book. Verse and prose, epigrams and riddles, anecdotes and ballads, broadsides and plays, are mingled almost pell-mell; and, to add to the confusion, the author now and again inserts a disquisition, or a preface, or a connecting paragraph, which is undistinguished typographically from the reprinted matter. When this has been said, there is little fault to be found with this interesting collection. The author has suppressed the grosser indecencies which lay ready to his hand, while leaving enough to show the coarseness of the age. He has annotated the text, on the whole usefully, but sometimes unnecessarily; once, we have observed, he has failed, as if from inability, to do so. He prints: "I had hope (*sic*) him off with all his cloaths." Few readers would be troubled by this form of the preterite of "help," least of all those who know their 'Uncle Remus' by heart: "Den Brer Wolf, he put in en hope Brer B'ar pull, but dez like he didn't; en den dey all hope 'im, en, bless grashus! . . ." Mr. Ashton has also furnished each extract with a number referring to the list of sources in the appendix; has copied in facsimile a large number of curious woodcuts appertaining to his material, and has added the music of his ballads where he could—some of this being well worth recovering.

We have already indicated the nature of the contents. Of all the objects of satire, the woman, the wife, and particularly "the cruell shrow," is the chief, surpassing the Welshman, the Cavalier, the Oxford "literary feller," and the Papist. Here is the mildest form of it, which sums up not badly one of Lowell's familiar poems. It is taken from 'Witts Recreations. Selected from the finest Fancies of Moderne Muses' (1640):

"Marriage, as old men note, hath likened bin
Unto a publique feast, or common route,
Where those that are without would faine get in,
And those that are within would faine get out."

From the same source comes also this bit of pleasantry, which may illustrate in one way the drinking department of the book, as in another the fine old ballad of the "Bloody Murther of Sir John Barleycorne":

"A fly out of his glasse a guest did take,
'Ere with the liquor he his thirst would slake.
When he had drunk his fill, again the fly
Into the glasse he put, and said, 'Though I
Love not flyes in my drink, yet others may,
Whose humor I nor like nor will gainsay.'"

Of the staple jest, the following is a fair specimen (from 'Coffee House Jests Refined and Enlarged,' 4th ed., 1686):

"A Man in a bitter cold Winter night was passing through the Street, and seeing all a Bed, and no Candle in any Window neither; then bethought himself of this project; for then he went up and down crying Fire, Fire, which made several come to the Windows: They askt him where? where? He told them that he did not know, for if he did, he would go to 't to warm himself; For, says he, I am devilish cold."

What is most interesting, perhaps, is the reader's recognition of old joes to which he is hereby enabled to give approximate dates. Thus one meets with the story of the old woman not ready to be put to shame by the little boy who knew his Creator, as "he was made but t' other day" (1698); of the surgeon who sends for a plaister without delay for an alarming wound that "will heal of it self" if the messenger does not make great haste (same date); of the "Conceited Scholar that was lately come from *Oxford*," who "would needs be forming of Sylogismes," proves that two glasses of wine set before him "at the *Mitre Tavern* in the *Poultrey*" are three, and is left to drink the third as best he can (same date); of the man with whom it was "not so well neither" that he was married, because he had taken a shrew, and "not so ill neither" when his house was burned, "for my Wife was burned in it"—and all the wells and ills between (same date); of the man who would not weep under "a melting sermon" "'because,' says he, 'I am not of this Parish'" (1697); of the man who had as lief go to sea

though his ancestors died there, as another man to bed whose father, etc., had died there (1669). Add the tanner who finds London fashions "not like the Countries, for here the stones are fast in the streets, and the Dogs are loose," and excuses himself for not using the blunt end of his pike against the butcher's dog because the dog had not "used his blunt end, and runne his taile" at him (1650 ?). Here, too, occur the ambiguous verses "to be understood two ways":

"I saw a Peacock with a fiery tail.
I saw a blazing Comet, drop down hail.
I saw a Cloud," etc.

('Westminster Drollery,' 1672). And here, finally, is the culprit who retorts with a graceless pause upon the justice:

"Sir, I am no Dog,
Nor so errant a Rogue
As your Worship——takes me to be"

('Westminster Quibbles in Verse,' 1672).

Mr. Ashton offers this book as an illustration of "Merrie England"; but its mirthfulness is far from being so great as to repress reflections on the evolution of humor in two centuries. Some of the jocosities are almost naïf in their want of anything to stir the risibles, and in this class are anecdotes of what were doubtless actual occurrences, and which, when seen, were comical enough, but become vapid in the telling. We have room for only a single typical instance, taken, by the way, from 'The Sackfull of Newes' (1673):

"A Certain Butcher was flaying a Calf at night, and had stuck a lighted Candle upon his head, because he would be the quicker about his business, and when he had done he thought to take the same Candle to light him to bed; but he had forgot where he had set it, and sought about the House for it, and all the while it stuck in his Cap upon his head, and lighted him in seeking it. At the last one of his fellows came and asked him what he sought for. 'Marry (quoth he), I look for the Candle which I did flay the Calf withal.' 'Why, thou Fool,' qd. he, 'thou hast a Candle in thy Cap.' And then he felt towards his Cap, and took away the Candle burning, whereat there was great laughing and he mocked for his labour, as he was well worthy."

Compare this, for its realism, with the imaginative humor of the following sample of the "funny column" of our American daily press:

"A colored individual who went down on the slippery flags at the corner of Woodward Avenue and Congress Street, scrambled up and backed out into the street, and took a long look toward the roof of the nearest building.

"'You fell from that third-story window!' remarked a pedestrian who had witnessed the tumble.

"'Boss, I believes yer!' was the prompt reply, 'but what puzzles me am de quesbun of how I got up dar', an' why I was leanin' outer de winder!'"

Problems in Political Economy. By William G. Sumner. Henry Holt & Co.

THIS collection will be of great service to instructors, not only as furnishing them with a supply of exercises for their pupils and thus helping to do away with the old-fashioned system of recitations, but also as enabling them to test their own knowledge and powers of exposition: the book might, in fact, be used as a breviary with excellent results. The number of problems happens to be 366, which would allow one for every day in the year including Sundays, and an extra one for leap year. We can fearlessly say that if any one has the courage to devote that amount of time exclusively to answering these questions, he will never regret it—if he survives it. It was once said that it was impossible for any human being to *be* so wise as Lord Thurlow *looked*; and we cannot believe that the present graduates of Yale are so far superior to the former ones as the mastery of these problems would indicate. Some of them imply definite convictions concerning those fundamental principles of philosophy and human society that have been in debate since man became a thinking being, and others relate to subjects upon which it cannot be said that economists have come to any agreement.

For example, to answer the question, "Is political economy a deductive or an inductive science?" in any but parrot fashion, presupposes a profound acquaintance with logic and with scientific methods. The question, "What would be the effect of technical and industrial schools, maintained by taxation, on the wages of artisans?" opens the whole subject of the relation of the state to its subjects, and implies positive conclusions as to the comparative effects of taxation upon rents and wages. Some of the longer questions are still more far-reaching, but we have not space to quote them. Nevertheless, it is well to ask such questions if it be understood that the end is not truth, but the search for truth. As Professor Sumner says, the questions are leading, but although his pupils may be trained to give certain answers of a more or less ready-made character, the very method of instruction that he adopts necessarily develops the judgment. As he remarks in his introduction, the object of his exercises is to develop some independent power of thinking and of applying the principles which have been learned; but the power of criticising these principles is acquired with the power of applying them. We are apprehensive that the statement, "I have long used fallacies as auxiliary to my other class-room work," may be seized upon by captious protectionists as a damaging admission; but it can be met by showing that it is their fallacies to which the author refers. While, we repeat, the book will be of much value to teachers, we can hardly agree with Professor Sumner in the view that a person who has studied only an elementary text-book can deal with these problems. They are in many cases so worded as to be nearly unintelligible to those who have neither heard the author's exposition of the subjects, nor read the works containing the doctrine to be criticised. Even to a tyro, however, the work will be suggestive. Some of the problems are taken from Milnes's collection of 2,000 questions from English examination papers. The book is of a convenient size for the pocket.

John Greenleaf Whittier. A Biography. By Francis H. Underwood. Boston: J. R. Osgood & Co. 1883.

WE are not persuaded that this book has a clear title to existence. The most that can be said for it is that it has been prepared, if not with the approval, at least with the assistance, of the poet, and is the nearest approach to an autobiography that we are ever likely to get from him. But then, when we examine the new personal and genealogical details, we do not find that they add enough to what had been already published to justify another ante-mortem volume. It is something to learn that the first ancestor who came over was not a Friend, and should not have been called "Friend Whittier" by Mr. Kennedy in his biography (p. 11). But this being so, we might have expected to be told exactly which one of his descendants joined that denomination. By inference it was his youngest son, the poet's great-grandfather, who married a Quakeress. Again, in a much more important matter, Mr. Underwood has neglected to better the work of his predecessors. He repeats the tradition, for which Joshua Coffin, the historian of Newbury, was responsible, that through the Batchelder family (on his mother's side) Whittier is of one blood with Daniel Webster; and he enlarges it by including also the late Senator Fessenden, Caleb Cushing, Col. William B. Greene, "and other prominent men," all sprung from the Rev. Stephen Batchelder, the first minister of the town of Hampton, N. H. "It is now known," says Mr. Underwood; but he does not offer any but hearsay evidence in support of the tradition, whereas to establish so interesting an example of "hereditary genius" would have been worthy the greatest pains. A similar disinclination to hard work is shown in the bibliography, which is doubtfully an improvement upon Mr. Kennedy's—in some respects falls below it. Thus, the latter had in a foot-note corrected his erroneous statement that "The Deity" was Whittier's first published poem (in the *Free Press*). Mr. Underwood repeats the blunder (pp. 66, 396), though he of course had Mr. Kennedy's book before him. The point is not quite insignificant, for the title of the earlier poem, "The Vale of the Merrimack," is even more indicative of that attachment to the soil which is one of the strongest characteristics of Whittier's muse.

For the rest, such a work as this, composed under existing circumstances, could hardly be made up without padding, of which Mr. Underwood has been free, as witness the long talk about Quakers in general, and many an irrelevant passage. Whittier's life, while of great moment to the country, has been comparatively uneventful, and the untrammelled biographer would find himself reduced mainly to a study of character and opinion. This, however, would involve far more labor than a mere narrative of personal incidents, and it could not decently be undertaken while Mr. Whittier still survived. For the former rather than for the latter reason, perhaps, Mr. Underwood has avoided the task, and in so doing he has obscured rather than thrown light upon Mr. Whittier's relations to the anti-slavery agitation, for example. Motives of delicacy must put a similar restraint on the critic of the poet as a poet. Nothing would have been lost if Mr. Underwood had omitted all his fine writing in this direction, always excepting the possible inducement so many selections may give to read more deeply of Whittier. As criticism it hardly deserves attention. It remains to point out one or two serious slips of the pen. On p. 107, "Brattleboro'" stands for Bennington. It is inconsistent with all that is known of the editor of the *Liberator* to be told, on p. 127, that "Garrison opposed this view on the ground that a moral cause could *not* be carried on to success without ignoble means." No one who had ever seen John Brown would have described him as "below the middle size" (p. 226). Even at the age of eighteen he was remarked as "a tall, sedate, dignified young man." There are some admirable portraits in this volume—one in particular of Whittier at the age of thirty—and other engravings.

Characteristics. Sketches and Essays. By A. P. Russell. Boston: Houghton, Mifflin & Co. 1884.

MR RUSSELL is one of those authors who write books because they are affected by the distemper called the *lues Boswelliana*. He is ever regretting that every great man was not attended by a Boswell, as his shadow or daimon: "what a book we would have had," he keeps saying, as if the principal use of men of genius were to furnish food to the gossip-scavengers of literature. In default of such author-valets, however, perhaps the next best thing is to supply their place by a diligent reader of memoirs and diaries, who shall collect from this and that quarter the scattered anecdotage concerning those unfortunate

gentlemen who trusted their fame only to their public works.

In this spirit the compiler of these essays on literary or other celebrities has gathered up the stories about Macaulay or Randolph, or whoever it may be, and bound them together by the slightest thread of comment. When, as sometimes happens, there is a dearth of witticisms or adventures in the career under review, he helps the matter out by inserting other tales of kindred spirits, or even less apposite padding, such as Arabic proverbs or moral apothegms. Now, in the manner of the elder Disraeli, he seems selecting from his commonplace book or rummaging his library to make up his patchwork essay; or again, like Montaigne, he slips into a paper on "Habit" the most various material quoted from here, there, and everywhere. Such authors he evidently loves and has in mind; perhaps it seemed easy to him, while he read the one or the other, to make similar books. But in the trial how much easier it always is to miss the secret of that touch which gives to the Englishman's works the pervading sense of scholarly cultivation, and to the Frenchman's the affability of noble leisure. It is harder to be a Disraeli or a Montaigne than a Boswell—at least it is so in Mr. Russell's case. Possibly the seeming haste in which the papers were put together made the result worse than it must needs be. The repetition of the same extract from Lord John Russell, or the same old anecdote of Johnson, grows monotonous; for even gossip may pall on the taste. More attention to style, too, would have made comparison with the suggested models less odious.

In regard to the substance, those who like collectanea of this sort need find no fault. The author has been diligent in his search and profuse in communicating all he found. Such as have occasion for stories of this kind (and the kind is often excellent), and are not above the peccadillo of adorning their addresses or conversation with second-hand glitter that looks like polite learning, will find this volume excellent for their purposes. A certain amount of rubbish and dust may be expected, as in any virtuoso's cabinet, but there are good things enough besides and well worth attention. It is not often that in the space of twenty-two pages (but without one original word) one can obtain so clear an idea of the talk of Coleridge; nor was its monotony and bathos ever more finely given than by its comparison, as here, to a great river like the St. Lawrence, a cataract, the Pontic Sea, a lake overflowing in inextricable currents and regurgitations, an ocean's ebb and flow, a river that imposes silence, the ocean, the waters—and so on to the end of Neptune's geography. For the essay on Woolman, too, we have a liking; the impression it leaves is as softening and ennobling as the one in Coleridge's case is humorous. But, after all, it is melancholy to see any writer dealing with poets like Burns and men like Johnson with such interest in their outward life, and such neglect of what makes them remembered, as if they were the cronies of Pepys instead of the brothers of Shakspere. Such a method is good enough for a wit like Foote, but not for one like Lamb. The whole volume reads like a Sunday newspaper—"reportorial" in substance, realistic, with a spice of morality and religion here and there, and interminably long.

BOOKS OF THE WEEK.

Aikman, Rev. W. A Bachelor's Talks about Married Life and Things Adjacent. Fowler & Wells. $1.50.

Bartlett, A. Jennie. Elder Northfield's Home; or, Sacrificed on the Mormon Altar. A story. The J. Howard Brown Company.

Byers, S. H. M. The Happy Isles, and Other Poems. Boston: Cupples, Upham & Co. $1.25.

Calvert, G. H. The Nazarene: a poem. Boston: Lee & Shepard. $1.

Cook, Mrs. E. G. For Mothers and Daughters. Fowler & Wells. $1.50.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 7, 1884.

The Week.

SENATOR SHERMAN'S latest banking bill is a trifle too obscure for popular understanding. It provides that upon a deposit of bonds any national banking association shall be entitled to receive circulating notes equal in amount to the par value of their bonds bearing interest at the rate of not less than 3 per cent., and redeemable at the pleasure of the United States at the date of such deposit; and if the bonds deposited are not so redeemable, and bear a rate of interest higher than 3 per cent., then the issue of circulating notes may be to an amount equal to 95 per cent. of the par value of such bonds and of the interest that shall accrue on such bonds before they become redeemable, in excess of the interest thereon computed at the rate of 3 per cent. per annum. "And at no time shall the total amount of such notes issued to any association exceed the amount at such time actually paid in of its capital stock, nor the ratio of such bonds and interest above stated, computed on the first day of January of each year." We suppose that this means that circulation may be issued on the 3 per cents at the rate of one hundred cents for each dollar of bonds, and upon the 4 per cents (redeemable in 1904) at the rate of one hundred and fifteen cents for each dollar—*i. e.*, ninety-five cents for the face of the bond and twenty cents for the excess of interest to accrue for twenty years over and above 3 per cent. per annum. This excess, however, is to be computed every year. Consequently the margin of circulation will decrease one cent on the dollar each year. It strikes us that it is quite as important to pass a bill that people can readily comprehend as it is to pass one that the banks can live under and subsist on.

That versatile and somewhat ubiquitous person, Mr. James McHenry, has been getting up a more dreadful exposure of what are called American "railroad methods" than any that has yet appeared. He made his very extraordinary discovery through his having been compelled by "recent events" to "look narrowly into the cause of the disasters to American railroads." What he has discovered is that about half the Western produce exported from Eastern ports is carried here fraudulently—that is, without paying anything to the railroads. Moreover, numerous trains, known, it appears, as "ghost trains," of which nothing is heard at the head offices of the companies, come from the West to the East. In fact, he says that only about one-tenth of the earnings of the roads reach the companies' treasuries. Nobody but Mr. McHenry, we venture to say, ever dreamed of the frauds reaching such a high figure. But Commissioner Fink, who is much better informed about American railroads than Mr. McHenry, says these fraud estimates are far too high; for, says he, the acknowledged railroad receipts last year were $700,000,000. If this was, however, only one-tenth of the actual receipts, the total must have been $7,000,000,000, which is the actual cost of building all the railroads in the United States. So that, if Mr. McHenry's story were true, it would show that the railroads earned their cost in one year, and lost $6,300,000,000 by theft, without its attracting any attention. Mr. McHenry has evidently been looking too "narrowly" into the causes of American railroad disasters, or has delivered himself into the hands of some egregious impostor, or has himself been romancing a little. We fear the public does not greatly care which hypothesis is the correct one.

The most important bill for the regulation of inter-State commerce now before Congress is that of Mr. Reagan, of Texas. Mr. Reagan is a lawyer, and, we believe, an ex-Judge, so that it is not unfair to express the hope that if he reports his bill, he will fully explain in some detail to Congress and the country how he expects it to work. It contains some curious provisions. For instance, it is made unlawful for any carrier "directly or indirectly to charge to or receive from any person or persons any greater or *less* rate or amount of freight, compensation or reward than is charged to or received from any other person or persons for like and contemporaneous service in the carrying, receiving, delivering, storing or handling of the same." Any violation of the act makes a carrier liable to a suit for damages, to an amount treble the loss sustained, and a fine of a thousand dollars. It may be, for all we know, a very wicked thing for a railroad to charge one person more or even less than it charges another for a "like and contemporaneous" service; but what is a like and contemporaneous service? Apparently this precludes a railroad from lowering its rates in order to attract business from any particular quarter, a form of crime which is no doubt very common among the more reckless railroads in a new State like Texas.

Another species of villany very rife in some parts of the country is reached by the following section:

"SEC. 3. That it shall be unlawful for any person or persons engaged in the carriage, receiving, storage, or handling of property as mentioned in the first section of this act to enter into any combination, contract, or agreement, by changes of schedule, carriage in different cars, or by any other means, with intent to prevent the carriage of such property from being continuous from the place of shipment to the place of destination, whether carried on one or several railroads. And it shall be unlawful for any person or persons carrying property as aforesaid to enter into any contract, agreement, or combination for the pooling of freights, or to pool the freights, of different and competing railroads, by dividing between them the aggregate or net proceeds of the earnings of such railroads, or any portion of them."

The knowledge that the railroads not only "pool" freight, but do all in their power to prevent the carriage of property from being "continuous," has been thus far kept from the public; but it had to come out sooner or later, and Judge Reagan evidently means to show them that, the facts once known, no trifling will be allowed. He ought to be intrusted with all legal proceedings arising under the act.

The bill introduced into Congress last Monday by Mr. Hewitt, authorizing newspapers to copyright their titles, seems objectionable, chiefly on the ground that the copyright clause in the Constitution was not intended to apply to such a case. Congress is authorized to secure to "authors" the exclusive right to their "writings" for a limited time. (Constitution U. S., Article 1, sec. 8.) It seems going very far to call the selection of a newspaper title a work of authorship, or the person who selects it an "author." It is, properly speaking, a trade-mark, and as such, it is, we suppose, already protected.

The Fitz-John Porter Bill has passed the House by a considerable majority, after much good speaking, the last speech of note being one by Mr. Phelps, of New Jersey, who produced a letter of President Garfield's to General Porter, expressing himself favorably to the appointment of a board to review the proceedings of the original court-martial. One of the good results of the work of the Advisory Board which President Hayes appointed, is that it sifted the charges against Porter down to two points which the general public could understand and form a judgment about—namely, the slowness of the night march, and the failure to "go in there," on the 28th of July. Before this Board did its work the accusation against Porter bore in the public mind the aspect of a generally treasonable line of conduct, extending over many weeks, and coloring all his acts, and, according to one accuser, showing itself markedly in his countenance. The Advisory Board swept all this away, and brought us down to the only two facts of any importance, and on them threw a flood of light, through new evidence. Since its finding it is safe to say that no one who has examined the case, apart from strong political prepossessions, has failed to see in Porter a greatly injured man. Those who still resist his vindication, of whom General Logan is the chief, are men in whom the political traditions of the war are too strong to be shaken, and who in fact make it a rule to examine all questions arising out of the war under the influence of these traditions. To them Porter was, and must always remain, a traitor, because he was at a critical period dissatisfied with a change of command which good men and women at the North at that day received joyfully as a sign that the war had at last had sincerity and vigor infused into it.

It is reported that among the amendments to the Lowell Bankruptcy Bill suggested by the Convention recently held in Washington,

is one making dealings in "futures" on the part of the bankrupt a ground for objecting to his discharge. This, of course, must be based upon the idea that it is wrong to deal in "futures," but it is hard to see any reason for making a discrimination between this and other kinds of speculation. If the Bankruptcy Bill is to be used as an engine of general moral and commercial reform, then no one who speculates at all ought to be discharged; but why are dealers in "futures" any worse than the rest? The true test is not speculation, but fraud. If a trader conducts his business in such a way that he uses his credit to keep up a fictitious appearance of solvency after he is really bankrupt, he is a cheat and swindler, whether he is speculating in coffee or conducting an apparently conservative banker's business. Of course, dealing in futures under such circumstances would be very wrong, not because they are futures, but because the man, to save himself, is taking risks which will probably involve in ruin or serious loss numbers of innocent people who trust him.

The Atlanta *Constitution* maintains that Mr. Benjamin's denial of the authenticity of the Thurlow Weed Barnes letter "will amount to nothing as far as Republican editors are concerned." We doubt if there was any Republican editor who needed any such denial to convince him that either Mr. Thurlow Weed or Mr. Thurlow Weed Barnes had fallen a victim to a curious delusion. We do not for our part believe that anybody tried to impose on either of them about the letter, or that the writer of it ever thought of anybody supposing that it was written by Senator Benjamin. He was probably some poor devil of a Southerner stranded in New York, who wanted free transportation to Washington, and who signed it "Benjamin," because that was his first name, or because it was the first name that occurred to him. We believe, moreover, that this name "Benjamin" is the only reason which has ever existed for supposing that Mr. Judah P. Benjamin wrote the letter. As a mark of authenticity, it is about as valuable as the name "George" attached to a begging letter declaring the writer a high tariff man, would be in showing that Senator Hoar had secretly come to New York for a spree, had lost his money and was ashamed to borrow of his friends.

Mr. Blaine's "retirement" continues to be disturbed in various annoying ways. Only a few days ago his publishers were compelled to come out in a card denying a malicious rumor that they were in trouble through his failure to supply "copy" fast enough. The rumor was especially atrocious because everybody has had a chance to know, by means of regular weekly statements since the "work" was begun, that Mr. Blaine was reeling off copy at the rate of some thousand pages a month, and that he devoted no less than five hours a day to steady composition. His publishers say that he not only keeps the copy pouring in upon them in an unbroken stream, but that he is writing in a "thoroughly conscientious spirit," and that those who have read the advance sheets are charmed with its "style" and "fairness to both sides." The name of the book is incidentally given, and also the fact that more "steel portraits" will be added than was first intended. The card containing all this valuable information was published on Sunday. Now comes a statement from Pennsylvania that some meddlesomely active journalist there has taken a "poll" of an entire county of the State on the question of Republican Presidential candidates, with the following result: Blaine, 66; Arthur, 1; Lincoln, 1; Beaver, 1; Edmunds, 1. This will require another card containing a positive statement that Mr. Blaine cannot consent to be a candidate. How can a man keep himself in a proper frame of mind for historical composition with perpetual interruptions of this kind to distract him?

The *Christian at Work* is apparently not ashamed of its recent escapade, and returns to its defence of precautionary homicide with an increase of absurdity. What it says now is:

"If our 'preaching' does 'not provide any tribunal to decide' such cases, it is because such tribunals already exist in the established courts of the State—such a court as tried Nutt. The *Christian at Work* not only does not propose that there should be no trial in such cases—it believes that every man killing another should be tried just as Nutt was tried; so that the assertion of the *Nation* that our theory of the justification of a homicide like that of Nutt makes the slayer 'both prosecutor, judge, jury, and executioner,' is conspicuously inexact, and 'falls to the ground by its own gravity.'"

The writer of this extraordinary passage actually forgets the murdered man, and thinks his friends have no right to complain if only the self-constituted prosecutor, judge, jury, and executioner is, after murdering him, made to undergo even a mock trial, like Nutt's. Suppose, however, the jury had found Nutt's act unjustifiable, would this have given Dukes his life again? And if Billy McGlory should kill the editor of the *Christian at Work*, under a misapprehension as to his rights or wrongs, would complete amends be made to society if Billy were afterward tried, and it were shown that when he did the killing he really believed that the editor had done him a great wrong, for which the law furnished no remedy? Suppose it turned out that Billy had been mistaken, would this give the editor back to his work? We think, for our part, that a *Christian at Work* who does not see that if we allow any man to take human life with impunity, on any pretext, in his own quarrel, we open the door to the slaughter of innocent men, and help to bring all criminal justice into contempt, ought to take a vacation—and the longer the better.

Notwithstanding the long period of liquidation and declining prices—nearly two years now—the future course of prices and general state of finance is involved in more than the usual degree of obscurity. Until very recently it has been generally believed that when commodities "touched bottom" they would from that point begin to advance. But the experience with all the articles made from the two great commodities of iron and cotton has not borne out this expectation. The recent reduction of wages by the Fall River cotton manufacturers, and various other incidents, show that the producers and middlemen in all the lines of traffic in cotton goods have adopted the low prices as comparatively permanent. The same is true of the iron trade; there has been no reaction from the extreme depression, nor does the present aspect of trade promise any advance, or any increase of demand, even at the low prices, for any of the great variety of articles manufactured from cotton and iron. We have a large surplus of breadstuffs in the United States—more wheat, it is believed, than at this time last year—and notwithstanding that prices are below the average of the last fifteen years, there is but little demand in foreign markets for our surplus; consequently our exports are falling off as compared with this time last year, and the entire volume of our foreign trade, both in exports and imports, is very much less than it was then. The general drift of our foreign trade is indicated by the fact that foreign exchange has advanced gradually ever since the beginning of the year, until it is now so near the specie-exporting point that an outward movement of gold may begin any day. The dulness of trade throughout the country is of course an index of a decrease of enterprises of every kind, and this in turn is the reason of the excessive supply of idle money in the banks and the abnormally low rates of interest which have now prevailed for a longer time than ever before known in this country.

Mr. John Bright has been bitterly denouncing Mr. Henry George's land scheme on account of its confiscation feature, and remarked, aptly enough, that although it was an American invention there was no sign of its being tried on this side of the water. We called attention to the confiscation feature in these columns two years ago as insuring the condemnation and failure of the whole plan. The curious state of mind into which neophytes sometimes get was illustrated by the fact that this brought us some abusive letters from the Georgites, charging that we had never read 'Progress and Poverty,' or we would not assert that Mr. George proposed to take people's land without compensation. But he does propose it, and in a form which would make it the most heartless as well as the most extensive piece of robbery ever set on foot, for he proposes to rob not only the great landlord, but the poor laborer who had put his money into a house or a farm. We suggested at that time, and suggest now again, that the disciples should be required, as the early Christians were, to show their faith by their works, and that every one embracing the new gospel should be required to present a piece of land to the State. At present we notice, with shame, that it is always other people's real estate which the orators propose should be "resumed" by the Government.

Mr. Matthew Arnold has been asked in St. Louis to give his "general impression of

America," an inquiry regularly put to all distinguished travellers who visit the United States, but, as experience shows, very difficult to answer satisfactorily. The answer which the inquirer desires, and feels to be only fair and proper, is that the reality far exceeds the traveller's highest anticipations. That being once said, the ground is cleared for any friendly criticism that may occur to the visitor —as that life and property seem strangely unsafe here, or that it is singular how low the tone of our political life is, etc., etc. But Mr. Arnold, instead of pursuing this safe course, seems to have assumed that the interviewer wanted him to criticise what he had seen, and he accordingly replied that he noticed that at the railway stations people had to "help themselves," instead of having their comfort looked out for by guards and porters. This unfortunate remark he followed up by a reference to the London *Times*, showing that he understands very little the view generally taken of that newspaper by most Americans, and the interviewer mentions that he "sighed," explaining the sigh as coming from the remembrance of the pleasure he got at home from the daily perusal of that dastardly sheet. The interview adds little to our knowledge of Mr. Arnold or his impressions; but, as is so often the case, shows the interviewer to be a most intelligent and discriminating critic, with a dash of racy humor which Mr. Arnold sadly lacks, and consequently failed to appreciate.

The friends of woman suffrage in England are making a vigorous push to have the change embodied in the coming bill extending the franchise to county householders. Mrs. Fawcett, who has always been one of its vigorous advocates, writes cheerfully about its prospects to the *Pall Mall Gazette*. She uses all the well-known arguments in its favor, but her reasons for thinking she is going to get it are perhaps more interesting than her reasons for thinking that she ought to get it. One is, that at a great reform meeting in the Newcastle Town Moor last autumn, "all allusions to the desirability of removing the political disabilities of women were received with cheers and general approval." Another is, that the Liberal associations of Manchester, Leeds, Birmingham, Edinburgh, and Huddersfield have adopted resolutions "embodying the principle of women's suffrage." The third and last is, that the Liberal members in the present House of Commons are in favor of it by 120 to 76, whereas the Tories are opposed to it by 99 to 29. The Tories, however, have to be counted, unfortunately, on this as on other matters, and, when the Liberals are divided about anything, are very strong.

Mr. Gladstone has been receiving delegations from the late Liberal Conference at Leeds and also from the Trades Unions, seeking to stimulate him in his policy about the extension of the suffrage. The intentions of the Government are very well known as regards the measures it is to introduce. Whatever doubt exists is about the order in which they are to be introduced, and their dependence on each other. There is no doubt, for instance, that Mr. Gladstone will introduce a bill assimilating the county and borough franchises, but there is some doubt as to whether this will be accompanied or only followed by a redistribution of seats, or rather a rearrangement of constituencies. The Tories insist on having both measures together, and so do some Liberals. But the regular old orthodox Liberals wish to leave the order to Mr. Gladstone's discretion. They take similar ground with regard to the bill making London a municipality, which will be one of the most serious tasks he has ever undertaken.

There are all the signs in England of a stormy session of Parliament. The Parnellites have held their usual conference and show but little disposition to confine themselves, as their enemies in England always hope they will, to agitating for separation. They declare their intention of opposing the London Municipality Bill unless they can get a similar bill for Dublin, and are going to bring in a shower of bills of their own amending existing legislation about county government, the municipal franchise, the fisheries, the poor laws, and the national schools. These will of course not be passed, but they will obstruct English business, and are probably intended simply or mainly to meet the taunt that the Home Rulers make no practical demands, and produce no practical scheme of Irish reform of their own. The present tactics will undoubtedly be more difficult to deal with than those of last year.

A Cairo despatch to London states that the Khedive has received a telegram from Baker Pasha announcing his defeat near Tokar. His losses were 2,000 men, four Krupp cannon, and two Gatling guns. The disaster was expected, as Baker Pasha's force consisted of raw troops, poorly armed. The Egyptians are said to have "bolted." Whatever effect this defeat may have upon the ultimate solution of the Egyptian question, recent despatches must convince any fair-minded strategist that all attempts to meet the False Prophet with Egyptian troops formed in a "hollow square" ought to be abandoned. The effect of the attempt in this case is described as follows in one of the despatches: "Only three sides of a square were formed owing to the fact that two companies of the Egyptian troops stood still, being overcome with fright. The enemy poured into this gap, when the Egyptians threw away their rifles and flung themselves upon the ground screaming for mercy. The troops on one side of the square killed many of their own men by wild firing." A square with only three sides, with a gap presented to welcome the enemy, and with the troops on one side firing into the troops on the other, is probably the kind of square the Prophet likes best to meet. It is more common in cable despatches than in actual warfare.

The death of M. Rouher removes the last of the really prominent figures of the Third Empire. There is nobody left now who really stood by the throne of the last Napoleon and answered for him. Rouher in his later years was known as the "Vice-Emperor," so faithfully and fully did he represent his master's sentiments. His value lay mainly in his power and brass as a debater, which became very important after 1866, when the Corps Législatif began to get from under control, and large Liberal majorities began to come in at every election. His opinions were worth but little, and his advice was always wrong. But he figured prominently in some historic scenes. It was he who undertook to reply to M. Thiers's famous epigram, "You have not left yourselves another blunder to commit." It was he, too, who, when the terrible news of the formation of the new German Bund in 1866 came out, in 1867, threw Italy into the German alliance, by almost shouting in the Senate, that "never should she go to Rome—never." He made one more dramatic appearance in the new Chamber after the fall of the Empire, when he was baited mercilessly by the Duke d'Audiffret-Pasquier, in the presence of a crowded house, some of whom would have liked to assault him, and had almost to cry for mercy in his humiliation. He was the last of a tribe who brought almost indelible disgrace, not simply on French politics but on the French character.

The Nihilistic panic in Vienna continues, and is said to pervade all classes of the community. That something in the nature of an insurrectionary outbreak is feared seems to be inferable from the troops having been kept under arms in their barracks through the night. Anything of this kind is, however, very unlikely. The last thing the Anarchists in any country like to do is to show their actual numerical strength by an armed rising. They have hit upon a plan which answers their purpose far better than any open revolt, and that is the spreading of alarm by assassinations and explosions. This is a new but most effective weapon. It has succeeded wonderfully in Russia, measurably in England, and is succeeding now wonderfully in Austria. The great size of modern cities, the quickness of communication, and the greatly increased portability of explosives have placed it in the power of a very small number of men to fill the official and wealthy class in almost any community with terror. But predictions, such as those with which Mr. Henry George is now trying to revive his "boom" in England, of an internecine conflict between classes, like the Thirty Years' War in Germany, may be fairly set down as cheap rhetorical devices. The dangerous anarchical class in every civilized state is very small. The vast majority of the population are people who are industrious and own property, and will fight fiercely for peace and order if necessary. The only way in which the Anarchists can attain even a shadow of success is by lying hid and producing vague terror. If they were ever to show themselves in force anywhere, there would be no thirty years' war with them. Thirty hours would settle their grievances, and the settlement for most of them would be final and complete.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, January 30, to TUESDAY, February 5, 1884, inclusive.]

DOMESTIC.

SECRETARY FRELINGHUYSEN has addressed to the President a communication to be transmitted to the House of Representatives in accordance with the recent resolutions asking for information on the subject of pork prohibition. After reviewing the history of legislation against American pork, Secretary Frelinghuysen calls attention to the constitution of a pork commission by the President, and, in view of the prominent part this commission must play in any intelligent discussion of the question, recommends the President to advise Congress to abstain from any immediate legislative action until the report of the commission shall be before it. He adds that if in the face of clear proofs that our meats are free from disease, any nations with which we are on terms of intimacy should discriminate against us, it would then be the province of the Executive to call the attention of such nations to the provisions of treaties, with the confident expectations that those treaties would be respected.

Secretary Folger has written to the Supervising Inspector-General of Steam Vessels in regard to the application of Mrs. Miller, of New Orleans, for a license as the master of a steamboat plying on the Ouachita River: "I see no reason in unwritten or in written law why Mistress Miller may not lawfully demand an examination, and, if she prove herself duly qualified, have a license to serve as a master of a steam vessel."

In the House of Representatives on Thursday a bill was passed declaring forfeited a number of railroad land grants to Mississippi, Alabama, Louisiana, and other States. By a vote of 184 to 78 the House of Representatives on Friday passed the bill restoring Fitz-John Porter to the army, and directing the President to place him upon the retired list.

Mr. Morrison on Monday introduced his Tariff Bill in the House of Representatives. In general terms it proposes an average reduction of 20 per cent. from the existing tariff throughout the list; but there will be so many exceptions, both as to schedules and articles in the schedules, that the average reduction of the whole bill will not be more than 16 or 17 per cent. Mr. Morrison and his school claim that the actual reduction in the revision of last winter does not exceed 5 per cent., so that the reduction of last winter, taken with the reduction which will be proposed by the Morrison bill, will not exceed 22 per cent., which is a smaller reduction than the Tariff Commission pretend that their bill proposed. An extensive addition to the free list is also made.

Mr. Morrison says that he does not expect that Mr. Randall will resort to anything but open warfare to defeat his bill, or that Mr. Hewitt will introduce a separate measure. Mr. Randall for himself has said that he has no intention of withholding appropriation bills, as has been reported, in order to defeat tariff legislation.

A bill introduced in Congress by Mr. Eaton (Dem., Ct.) on Monday provides that any Federal officer who shall knowingly permit any of his subordinates to be assessed or called upon to contribute money for elections shall be guilty of felony, and on conviction shall be imprisoned two or five years. Any official contributing money shall be liable to indictment and subject to fine or imprisonment at the discretion of the Court, and any citizen knowingly soliciting from any officer or employee of the Government shall be guilty of a misdemeanor.

A bill was introduced in the House on Monday to amend the Constitution. It provides for the election of a President and three Vice-Presidents, each chosen for the same number of years. The First Vice-President shall be President of the Senate, and the Second or Third Vice-President shall occupy that position in case of the removal from office of the President of the United States.

Senator Logan has reported to the Senate the Cox bill to repeal the test oath with important modifications. It repeals the test oath, but it places the continuing stigma of treason upon the graduates of West Point and of the Naval Academy who joined the rebellion, and it makes it impossible for a disloyal man to recover war claims.

President Arthur gave his first state dinner for this season on Wednesday evening, to the members of the Cabinet, the General of the Army, a number of Senators and their wives.

Second-Assistant Postmaster-General Elmer resigned on Monday, and Chief Contract Clerk Henry D. Lyman was nominated as his successor. This is in accordance with civil-service reform principles. Mr. Elmer has accepted the Presidency of a New York financial company.

The decrease of the public debt during January was $11,958,004.

A warm debate took place in the Assembly at Albany on Wednesday, when the bill to regulate the hours of service on street cars was under consideration in the Committee of the Whole. The best men in the Legislature participated. The bill was ordered to a third reading by a vote of 89 to 27. It provides that no horse-railroad company shall exact more that twelve hours for a day's work from its employees. It is opposed on the ground that it is an interference with personal rights.

In the Assembly, on Friday, Mr. Locke, of Rensselaer, introduced a bill similar to the Scott Liquor Law of Ohio, with some modifications. It provides that upon each dealer in intoxicating liquors there shall be a yearly assessment of $300 for spirituous and $150 for malt liquors.

The Roosevelt Bill, taking from the Aldermen of this city the power of confirmation, was ordered to a third reading in the Assembly on Tuesday afternoon by a vote of 61 to 38.

The New York Civil-Service Commission has sent its report to the Assembly with a message from the Governor approving suggestions that the law be made to apply more strictly to cities.

Statistics compiled by the Secretary of New York State show that the total number of paupers relieved and supported during 1883 was 135,154, and the expenses of the poor-houses, $2,112,792. In administrating temporary relief, $640,382 were spent. Of the total expenses New York city shows $1,070,320, and Kings County, $286,811.

Elisha Harris, M.D., Secretary of the New York State Board of Health, died in Albany on Thursday. Dr. Harris was regarded as a high authority on the subject of vital statistics, and in relation to sanitary matters generally.

The Texas House of Representatives has passed a bill imposing a penalty of from one to five years' imprisonment for fence cutting, but allowing any one who has been completely cut off by surrounding fences to open a passageway.

The jury in the Feuardent-Cesnola suit gave a verdict late on Saturday afternoon. They found for the defendant on the first and third counts and on the second count ten stood for the defendant and two for the plaintiff. Of the five counts, on each of which Mr. Feuardent claimed $5,000 damages, only three were submitted to the jury. The libel alleged in the first was that in his first published answer to Mr. Feuardent's criticisms on the Cypriote statues, General di Cesnola said that the charges were maliciously made, and absolutely without foundation in fact; in the second count, that in a letter to the trustees of the Metropolitan Museum General di Cesnola said that the firm of Rollin & Feuardent had not made an honest effort to sell the collection, and had overcharged him for expenses. The third count was based on General di Cesnola's letter, published in various newspapers, intimating that Mr. Feuardent was a charlatan, ignorant of archæology, and either thoroughly dishonest or thoroughly ignorant and reckless.

The long strike in the glass-works trade, which has lasted for seven months, was settled by the conference at Pittsburgh, Pa., on Wednesday. The strike was against a reduction of from 10 to 20 per cent. in wages. The basis of the settlement is immediate resumption at last year's wages, which will be paid until April 1, after which, until July 1, the wages will be governed by a sliding scale based upon the price of glass.

A strike of the spinners at ten Fall River, Mass., mills was begun on Monday.

Rowell, the murderer of Lynch, who seduced his wife, was acquitted at Batavia, N. Y., on Thursday, on the ground of self-defence. His attorneys had urged the plea of insanity. Rowell was given a popular reception.

Eleven colleges were represented by thirty-one delegates at the second annual conference of the College Young Men's Christian Association held at Amherst, Mass., during the week.

Wendell Phillips died at his residence in Boston on Saturday at 6:15 P. M., after an illness of about one week. His disease was angina pectoris. He was born November 29, 1811. His invalid wife survives him. The funeral services will be held on Wednesday. The Rev. Samuel Longfellow will deliver an address.

Catherine Morgan Dix, widow of General John A. Dix, died in this city on Sunday at the age of seventy-seven.

President H. E. Packer, of the Lehigh Valley Railroad, died at Mauch Chunk, Pa., on Friday, at the age of about thirty.

FOREIGN.

It was reported from Egypt on Wednesday that Baker Pasha, with 1,600 troops, had landed at Trinkitat on the previous Monday, and an additional body of 2,000 men landed on Tuesday, completing the force for the relief of Tokar. Nearly 20,000 rebels are between Trinkitat and Tokar. Baker Pasha recently made a cavalry reconnoissance, and attacked Osman Digna, killing and wounding more than 120 of his men.

The commander at Tokar, in a letter published on Friday, said: "It would be impossible for our condition to be worse. The rebels have filled up all the wells outside the town. The water inside is brackish and bad, and the troops are suffering from diarrhœa. There is great fear that it will be necessary soon to surrender. The firing on the part of the rebels continues day and night."

A spy captured near Trinkitat on Friday reported that there were 7,000 rebels five miles distant. Baker Pasha sent letters promising full pardon to rebels who submit to him.

The enemy has made an unsuccessful attack upon the fortified camp of the Egyptians at Suakim. Baker Pasha's advance on Tokar was begun on Sunday. The Turkish Ambassador to Great Britain has informed Earl Granville that the Porte is preparing a note to the Powers insisting upon the retention of the Sudan as an integral part of Egypt under the Sultan's suzerainty, and requesting that the whole question be referred to a conference of foreign ambassadors at London or Constantinople. Bismarck has advised a postponement of sending the note.

Despatches from Suakim received on Tuesday announced the serious defeat of Baker Pasha on Monday. He was near Tokar when attacked. Of the 3,500 men which he had with him 2,000 were killed and wounded. Four Krupp and two Gatling guns were captured. The Turks and Europeans fought well. With the remnant of his force Baker Pasha succeeded in reaching Trinkitat, where the gunboat *Ranger* is lying. He will proceed to Suakim immediately on the *Ranger*.

General Gordon telegraphs to London that messages have reached him from the Sudan hailing his mission with gladness.

At a great Liberal meeting in Birmingham, Eng., on January 29, Mr. John Bright denounced the virulent and extravagant attacks made by the Conservatives upon the Government during the Parliamentary recess. The Tories, he declared, were still as much opposed to the rights of the people as when they opposed the abolition of the Corn Laws. Mr. Bright entreated the workingmen of England to continue to exclude from power a party which so injured and insulted them, while it continued unchanged and impenitent.

Mr. Bright also condemned Henry George's land propositions, saying that they were most extraordinary and impracticable, and the wildest ever imported by an American inventor. Mr George's scheme began with a hitherto-unheard-of general system of confiscation, which Mr. Bright believed would end in immeasurable evil and confusion. The plan, he said, was simply an insult to the intelligence of the English people. Nevertheless, the system of land tenure must be altered so as to enable the land to come gradually and naturally into the hands of those most requiring and desiring it, most able to pay for and be t able to work it for the public advantage. Englishmen should try these reforms before attempting wild and extravagant schemes.

An urgent summons was issued on Thursday to the British Conservatives by the "whip" of that party. He says that an amendment relative to the Egyptian policy of the Government would be moved to the address in reply to the Queen's speech, and that an important division would, in all probability, be taken on the 7th of February.

Mr. Bradlaugh made no effort to take the oath on the opening of Parliament, but remained below the bar. On the 11th of February, however, he will advance to the table of the House of Commons in order to take the prescribed oath. Meanwhile Sir Stafford Northcote will make no motion hostile to Mr. Bradlaugh, and will not support any Conservative who does so.

Parliament was opened on Tuesday by Royal Commission. Very few members were present to hear the Queen's speech read. It announced the continuance of friendly relations with all the foreign Powers and made no statements of particular significance. In regard to Egyptian affairs it says that the order of evacuation was recalled as a precaution against possible effects of the Sudan military reverse in Egypt itself. The aim of the occupation of Egypt remains the same as heretofore. Such counsels have been offered to the Egyptian Government as a prudent regard for its resources and conditions seemed to require. The address in reply was adopted by both houses without amendment. In the House of Commons an amendment was moved and the Government policy was severely criticised by the Conservatives, but the Liberals made no reply, as all members of the Cabinet were absent at a special Council on Egyptian affairs. A vote on the amendment was thus precipitated, and the Conservatives were wholly unprepared. The vote was 77 to 20 against the amendment. The Conservatives complain that they were deceived by the Liberals. They intended to prolong the debate until Friday and then marshal all their forces for a vote.

At the conference of Parnellite members of Parliament in Dublin on Monday, it was decided to oppose the London Municipal Bill, unless a similar bill for Dublin should be introduced. It was decided to introduce bills amending the acts which relate to land and to laborers. These will deal with county government, municipal franchise, fisheries, the reclamation of land, the poor laws, national teachers, and the registration of voters.

A letter from the British Government was officially transmitted to the directors of the Suez Canal Company, at their monthly meeting in Paris, on Tuesday, approving the convention of M. de Lesseps with the British steamship owners. This agreement was made in November, 1883. M. de Lesseps advised its acceptance.

Lord Derby, British Secretary of State for the Colonies, has accepted the modified proposals of the Transvaal delegates regarding the new frontier by which a commission appointed for the purpose is to settle the disputed boundary on the spot.

Marquis of Queensberry, in a pamphlet to Parliament advocating reform in the marriage service, proposes, in order to meet divorce cases, to leave out in the marriage ceremony the words, "Whom God has joined together let no man put asunder," substituting "Whom the Government or nature may put asunder let no man attempt to keep together."

In the debate on the labor question in the French Chamber of Deputies on Thursday M. Ferry said that it did not appertain to the Government to find a solution of the labor problem, but rather to private persons. Real reforms consisted of liberty in individual initiative and foresight. The state ought to aid a private initiative, but not become its substitute. M. Clémenceau, replying, said that crushing taxes and high rents caused the sufferings of the working men. The remedy was an alliance between the working men in all countries, a reduction in freight rates, and the development of public instruction and liberty.

In the French Chamber of Deputies on Saturday, M. Clémenceau's resolution for the appointment of a committee to inquire into the needed reforms of the working classes was adopted by a vote of 254 to 249, notwithstanding the protest of M. Ferry. The Senate, by a vote of 136 to 117, has rejected the clause of the Trades' Syndicate Bill, legalizing federation trades meetings.

There are exciting rumors in Vienna of a plot to assassinate the Emperor of Austria, the Empress, and certain princes, statesmen, and editors who have been condemned to death by the Anarchists. Several bodies of troops are kept under arms in case of emergency.

In spite of numerous arrests, the agrarian agitation still continues in Pskow and Vitebsk, Russia. So intense is the irritation of the peasants in the latter province that the Governor has telegraphed to St. Petersburg asking that the troops specially sent to Vitebsk be withdrawn as a collision is feared.

The Berlin police discovered on Thursday a Socialist plot to rescue the Russo-Polish student, Padlevski, who had been imprisoned there for the past nine months. Two Socialist leaders were placed under arrest.

The Lower House of the Prussian Diet passed on Thursday the estimates for public worship, in spite of the opposition of the Ultramontane party, by a vote of 147 to 100.

The controversy between the Liberal and Conservative press of Berlin regarding the funeral of Herr Lasker has grown in bitterness and intensity. The Conservative papers make violent attacks upon the memory of the dead statesman.

The *Moniteur de Rome* on Saturday said: "Herr von Gossler's recent replies in the Landtag end for the present all hopes of a reconciliation between the Vatican and Prussia. The Catholics of Prussia are full of faith and ardor, and ready to meet fresh persecution for the honor and liberty of the Church." The Court of Cassation has decided the case of the Government against the Propaganda, that the latter's real property must be converted into Government stock. This decision is a severe blow to the Vatican, which talks of appealing to the Powers.

General Lew Wallace, the American Minister to Turkey, has demanded from the Porte an indemnity of $10,000 on account of the alleged illegal arrest of Dr. Pflaum, an American, by the Governor of Assos; also an indemnity for the American travellers who were recently attacked by Kurdish brigands in Anatolia.

Two invalided members of Henry M. Stanley's expedition to the Congo River have arrived at Madeira. It is their positive opinion that M. de Brazza, the leader of the French expedition, is dead, as at last accounts he was surrounded by hostile natives.

O'Neill, the African explorer, has arrived at Mozambique, having traversed 1,400 miles of hitherto unexplored territory between Lake Nyanza and that place. He discovered Lake Amurambu, which he declares to be the true source of the Prenda River.

Fears of another revolt in the Spanish army were reported, on Tuesday, in a Berlin despatch.

The new agreement between the Canadian Government and the Canadian Pacific Railroad was presented to the Dominion House of Parliament on Thursday. By it an advance of not more than twenty-two million five hundred thousand dollars is made by the Government at five per cent. interest, for which the entire road becomes liable. The three per cent. Government guarantee remains as before.

The Winter Carnival was opened auspiciously at Montreal on Monday. The Governor-General arrived in the afternoon and was given an enthusiastic reception. In the evening there was a torch light procession of snow shoe clubs and an illumination of the Ice Palace. Ten thousand visitors had arrived in the city on Monday.

P. W. Thomas, Sons & Co., London stock brokers, failed on Thursday for about $4,000,000. One member of the firm has absconded.

Eugene Rouher, the French statesman, died in Paris on Sunday, at the age of seventy. He began his public career after the Revolution of 1848, when he was sent to the Constituent Assembly. He became Napoleon's Minister of Justice in 1849. Napoleon appreciated his abilities and frequently recalled him to his Cabinet. In 1860 he concluded a treaty with England on free-trade principles and in the following years concluded equally liberal treaties with other countries. In June, 1863, he became President of the Council of State. For the next five years he shouldered great responsibilities—the Mexican expedition and the Maximilian episode, the relations of France to America during the civil war, and her attitude toward Germany. He opposed the granting of more liberty to the people, and his ministry fell in 1869. He was then made President of the Senate. The Emperor was supported by him in precipitating the Franco-Prussian war. In 1872 he again entered the Chambers as a Bonapartist and advocated the Prince Imperial's cause until his death. He was an efficient supporter of free trade.

The death of the Swedish Bishop Carl Olaf Bjorling was announced on Friday. He was the author of a number of works on theology, history, and philosophy, written in Latin.

The death of the eminent Danish preacher and theologian, Hans Lassen Martensen, was announced on Monday. His most important work is a profound treatise on 'Christian Dogma' (1849).

Josephine Gallmeyer, the well-known German soubrette, died in Vienna on Sunday at the age of forty-five.

THE STATE OF TRADE.

THE situation of trade and industry shows no improvement with the beginning of the new year, nor is there any reason, except in the hopes and imaginations of men, why January, 1884, should be different from December, 1883. It is true that a good deal of money is liberated on the first of January, in the shape of dividends and interest; but unless the conditions of trade invite its investment in productive industry, the effect of dividend and interest payments is as small as the transfer of money by an individual from one pocket to the other. Midwinter is the time of all others when we should least expect a revival of trade, and this has been an unusually close winter. What the approaching spring may have in store for us we must wait to learn.

We have remarked in former articles that the present state of trade and industry bears all the marks of a commercial crisis except one. It was *not* introduced by a money panic. According to the usual conditions of a crisis, we should have had a great stringency in money about the 1st of July, 1881, a run on the banks, a violent collapse of credit, a sudden fall in stocks, and a lot of heavy failures followed by a dribble of smaller failures prolonged for an indefinite period. The absence of anything like a money panic in the present case has deceived even the shrewdest and most experienced observers of commercial events. The decline in stocks has been very gradual, and there has been no collapse of credit, yet we are having all the after effects of a crisis in full measure. Manufacturing industry is depressed to a degree hardly surpassed in our history, and mercantile failures are extraordinary in number and amount. It is a common remark among those who do not look below the surface of things, that this is "a rich man's panic." The losses of a few rich men make a stronger impression than the pinching of the great mass of the well-to-do and working-classes, whose silent but severe economy and suffering are manifest on every hand. But it is not true that this is peculiarly a rich man's panic. If the millionaires have parted with a few of their millions the poor have encroached heavily upon their past savings; and many thousands of them in the iron, woollen, and cotton trades are out of work altogether, with no immediate prospect of re-employment.

Another singular and anomalous condition of the crisis is that prices of agricultural products are depressed in a marked degree, together with those of manufactured goods. As the exchange of the one for the other really constitutes the trade of the world, it would seem that a simultaneous decline of the two ought to leave things about where they were before. Such would be the case if the decline were proportional all round, but it is not proportional. The products of handicraft have fallen in price more than the products of the soil. Sales of cotton goods have been made this winter at thirty per cent. below actual cost to the manufacturer, and an enormous quantity of like fabrics are on hand in warehouses, and cannot be sold except at prices which will not replace the capital that they represent. No such condition exists as regards agricultural products, although prices are considerably lower than the average of this season of the year, and lower than we had reason to expect when the harvest was gathered. If the decline had been equal to that which has taken place in other departments of industry, there would be no such thing as a general depression, although there might be special cases of stagnation and distress growing out of overproduction in particular lines of trade.

A large part of the existing depression results from the slackening of railway construction since the close of the year 1882. Few persons have any adequate conception of the amount of labor and material required to build and equip a thousand miles of railway. When we say that the West Shore and Buffalo Road, for instance, has cost fifty or sixty millions of dollars, the mind can scarcely grasp a sum of such magnitude. Still less can it trace the countless channels and rivulets through which so vast a reservoir of capital has taken its refreshing course. The stoppage of such gigantic works has the same effect upon general traffic as the derailment of a fast-moving train of cars has upon the passengers, who are dragged a long distance bumping over the ties if not completely overturned.

The overproduction of railways during the past four years has been the cause of the overproduction of many other things, especially of things which enter into the construction of railways. An abnormal activity in these trades has turned more capital and labor in certain directions than can be profitably and permanently employed there. There must be a redistribution of employments, and this is in fact now going on. The cure and remedy for the hard times is to be found in this way, and no other. When the equilibrium of employments is once more reached or approximately reached, it will be found that good times have returned unperceived. Business will then start up afresh as it did in the latter part of 1879, and with as little presage of its coming.

MR. FRELINGHUYSEN ON COPYRIGHT.

THE importance of the correspondence between the American Copyright League and Mr. Frelinghuysen lies chiefly in the fact that his letter may be taken to represent the views of the Administration, and to show that should an authors' copyright bill pass Congress, the President would sign it. In a measure intended to afford international protection to authors, the President would, in the ordinary course of things, be guided by the opinion of the Secretary of State. Especially would this be the case now, when the State Department has already been appealed to to secure the same protection by way of treaty. Mr. Frelinghuysen, too, is one of the few very cautious and reticent men in public life, and would not be likely to break the silence he has carefully maintained as to copyright ever since he came into office, unless what he said was intended to go for much more than the expression of mere private opinion. He has, in fact, apparently taken the opportunity afforded him by the letter of the League to make such a statement of the views of the Administration on the subject of copyright as it would have been long ago forced to make on the floor of Congress had the Cabinet seats there.

The correspondence shows that the Copyright League, before adopting their present plan of urging before Congress the passage of a simple authors' copyright law, very judiciously determined to get some official statement of the exact condition of the negotiations for a publishers' treaty. The possibility of obtaining copyright by means of such a treaty had been under consideration for several years, and it was generally understood that the negotiations were a failure; but so far from anything being known positively on the subject, it was not even known what were the views of the Secretary of State as to the possibility of disposing of the matter by treaty, or as to copyright in general. Any one who wished to know what Mr. Frelinghuysen's views were, had to apply confidentially, not to anybody connected with the Government, but to some publisher; and, as a result, all that he could find out was that Mr. Frelinghuysen was thought to be opposed to a treaty; but whether because he was in favor of securing copyright by some other means, or because he was a believer in piracy and "cheap books," could not be ascertained. The Copyright League determined, in the first place, to find out. They therefore wrote him a letter, in which they asked him to let them know how the negotiations stood, expressing themselves at the same time as opposed to the whole scheme of a publishers' treaty, yet willing to take even that if they could get nothing better. What the publishers had tried to get was a treaty recognizing the English author's copyright here, provided he would sell it to an American publisher within a limited time, or vice versâ as to American copyright in England. What authors want, and what justice demands, is a recognition of copyright as property in both countries without any such restrictions whatever. Nevertheless the authors were willing to take for the time an instalment of justice granted them as a sort of boon by the publishers of England and America. Thus far, nobody had profited in any way by what had been attempted, except the great pirate Munro, who had neatly used the time consumed in the negotiations to make his fortune by wholesale plunder of both the foreign author and the American publisher. He, of course, must have hugely enjoyed the spectacle afforded by the discussions in the press over the question, whether the time during which justice required that the foreign author should be protected from him was three, six, or, as some people thought, nine months. Not a month, said he, not a week, not an hour. Rob the rascal as soon as he reaches the market, and give the public "cheap books."

Mr. Frelinghuysen's reply to the League is dated January 25, and states that the treaty "is still under consideration," but adds these words, which, so far as the Administration is concerned, remove all perplexity and obscurity from the path of those who have taken the matter up. He says:

"The difficulty in the way of negotiating a

formal copyright treaty with any foreign country is that the copyright laws of the two countries are usually so different that a detailed reciprocal code cannot be agreed on. Such a codified treaty necessarily puts the foreign author on a different footing from the home author, more privileged in some things it may be, and less so in others. And this difficulty is enhanced when—to quote the language of the Executive Committee's letter—such detailed stipulations 'put limitations as to time of publication and impose conditions as to manufacture that belong to regulations of trade and tariff, and not to authorship.' I am satisfied that a simpler solution of the question could be effected by some means which will give in each country to the foreign author the same right as a native author enjoys. The domestic copyright law does not attempt to legislate upon the relations between an author and his publisher, and it is not easy to see why an international compact should legislate upon a point which in each country is left to the course of trade. I think the foreigner owning a copyright should have here the same privilege as our own citizens, provided our citizens have in the foreigner's country the same rights as the natives thereof; and thereupon I would leave to the mutual convenience of the holder of the copyright and the publisher the adjustment of their contract, and leave to the tariff the task of protecting the paper makers, type founders, printers, and other artisans who join in producing the book as a marketable article."

This was probably much more than the League expected to get. Before the reply was written, Mr. Dorsheimer had introduced in Congress his simple authors' copyright bill—embodying precisely the same suggestions which, with some amendments making the term of international copyright the same as that of domestic copyright, the Judiciary Committee has agreed to report favorably to the House. The publishers are in favor of some bill, and it is known that the cheap-book business—the 20 and 25-cent "libraries" (reprints of foreign copyright works)—has been pushed so far that there is now little or no profit either in piracy or in reprinting from advanced sheets. The advanced-sheet publisher is only a fortnight ahead of the pirate, and his "library" cuts heavily into the pirate's profits. The foreign author suffers, and nobody gains. Hence, after many long years, the sudden and significant cessation of the people's bitter cry for cheap books, and the remarkable discovery that the press of the country, the Executive, and probably a majority of Congress, are in favor of putting the right of the literary man to the enjoyment of the product of his labor on the same footing with the right of the planter to his bale of cotton, of the farmer to his acre of wheat. The League has a chance such as no movers for copyright in the last fifty years have enjoyed.

THE FEUARDENT-CESNOLA TRIAL.

The Feuardent-Cesnola suit has at last terminated. The jury has refused to believe the attacks on the genuineness and authenticity of the Cesnola collection made by Mr. Feuardent, directly and through Mr. Clarence Cook. On the charges brought by General di Cesnola against Mr. Feuardent, in connection with their business transactions, it has failed to come to any conclusion. All this was foreshadowed clearly enough in 1881. It was tolerably plain then that Mr. Feuardent and his friends were asserting a great many things about the collection which they were unable to prove, and were relying on such flaws, or shortcomings, or contradictions as they could detect in General di Cesnola's writings and personal history to make up for any defects there might be in their own argumentation. It was this importance of the part played in their case by the personal element which made their writing so heated and vindictive. Such fury as pervaded Mr. Clarence Cook's pamphlet and the articles in the *Times* would have been useless and ridiculous if the destruction of General di Cesnola's personal reputation had not been so needful to success of the whole enterprise. No sane man, however enthusiastic an archæologist, could have become so excited simply over the question whether "No. 157" had had a tambourine stuck on it, or "Hercules" had been furnished with a new leg.

It is necessary to a proper understanding of the case to admit that the history of the collection furnished a good deal of material for this mode of attack. General di Cesnola did not go to Cyprus with any special or proper equipment for the work of archæological exploration. His previous career had been that of a soldier, and not that of a savant or even a student. He acknowledged on his cross-examination that he had not given any attention to archæology until he began to excavate, and he was then obliged to import from abroad the books with which he "studied up." He had apparently at that time not visited the Continental museums, nor familiarized himself in any way with the work that had been done in this field by the great lights of England, France, and Germany. Nor does it appear that he had any of that thorough knowledge of ancient literature which is so needful a part of an archæologist's outfit. Moreover, he was, during his explorations and up to the time of the sale to the New York Museum, placed in the anomalous and somewhat embarrassing position of having to seek a market for his finds almost as rapidly as he reached them. He made four or five consignments of antiquities for sale in England in the course of the ten years he was in Cyprus. There is nothing discreditable in this. There was no good reason why General di Cesnola should not sell his discoveries; but we all know that nobody who is looking for a market for anything can long preserve a scientific or judicial frame of mind about it. A man may have to be at the same time a dealer and an archæologist, but just in so far as his collections become wares must his judgment of their scientific or artistic value be disturbed or impaired. While General di Cesnola was trying to play these two not wholly compatible rôles, he wrote a good deal about the collection, both letters and articles and a book, sometimes in the character of a vender and sometimes of a virtuoso, and he was evidently all the while learning more and more about his subject, correcting some of his earlier impressions and getting a clearer knowledge of the archæological standards and tests and terminology. It is plain from his evidence, for instance, that when he wrote his book he did not attach the precise and distinct meanings to the words "repair" and "restore" which he has more recently made them bear.

The result of all this is, naturally, that it is possible to catch him in a good many contradictions, and inconsistencies, and misdescriptions, and failures of memory. He wrote a good many things during this, to him, most eventful and exciting period of his career, which it would doubtless be well if he had not written, and which he himself regrets, and which are capable, in the hands of an enemy, of disagreeable interpretations. But then which of us would pass with success or *éclat* through the ordeal to which he was subjected on the witness stand the other day? Who could bear to have his private letters, accounts, articles, promises, professions, explanations, during six or seven trying years, and his whole history from his boyhood, turned inside out by a bitterly hostile questioner, without suffering in some degree in dignity, if not in reputation?

The tribunal to which he submitted the Feuardent charges when they were first made, too, was, it must be admitted, unfortunately constituted. If these charges were worth examining at all, they should not have been examined by a body which, however competent, did not possess the complainant's confidence, and on whose impartiality he could cast reasonable doubts. Mr. Feuardent was not a person who could be treated with absolute contempt. He bears high testimonials from the authorities of the British Museum, who have employed him in this field as an adviser and purchaser for many years, both as to his knowledge and character. He was *primâ facie* entitled to have his charges passed on by an unprejudiced jury of experts. As a matter of fact they were passed on by a body of gentlemen who were almost necessarily biassed in favor of General di Cesnola, and of the contents of the Museum, and only one of whom had any reasonable claim to be considered an archæological authority. If it be said that the questions submitted to them were questions of fact rather than of law, the answer is that the main object of the investigation was to close Feuardent's mouth, and that this could only have been done, if at all, by plainly disinterested and authoritative judges.

The mistake that Mr. Feuardent and his friends made, however, to which the court and the public owed this extraordinary and costly trial, was in supposing that if they could discredit General di Cesnola as a man, the utter unreliableness of the collection as a specimen of antique art would follow as a logical sequence. No other theory will account for the extraordinary weakness and, as it has turned out, futility of their evidence as to the nature and extent of General di Cesnola's alterations. They have not been able to show that he made extensive repairs or restorations, or that any statue whatever is "a fraudulent patchwork of unrelated parts," or that anything has been done to the collection which any competent authority considers mischievous, misleading, unprecedented, or even unusual. They have fulfilled none of the serious promises of the Cook pamphlet or the *Art Amateur* article. The jury refused to adopt the theory that even if General di Cesnola were as base as Mr. Bangs depicted him, the

collection must be worthless either for artistic or educational purposes. They evidently are prepared to hold that a bad man may be a good collector, and that a statue may have great value even if the owner tells lies about it.

The truth is that the Feuardent party has suffered a good deal from having a too ready command of the press. Their situation now reminds one of the unfortunate stock speculator who said that "exclusive information and extensive banking facilities had been the ruin of him." They had so many periodicals and able writers at their disposal that they became lavish and overweening, and forgot, what is so necessary in making charges, to conjure up vividly and frequently the possibility of some day being called on to prove them before an unsympathetic audience. The most infallible of accusers has now and then to think of the witness stand in order to prevent his indignation from running away with him. Mr. Clarence Cook must just now be thinking of this a good deal. Ever since these proceedings began, the witness stand was for that furious and implacable archæologist the only post of honor. He ought to have passed the last three months in trying to get into it, in order to explain to an outraged community the true inwardness of this astounding fraud. And the truculent and amusing young lions of the New York *Times* ought to have sat round him on their haunches. But he avoided it as if it were a plague spot. He popped in and out of the court-room, but nobody called him, and he does not appear to have struggled or protested. This is a melancholy close to a very brilliant and exciting "art" episode.

SHOULD LYNCHING BE REVIVED?

THE Ohio lynching case recently reported reads in some respects like the cases common fifty years ago, when life and property in the new Western States were notoriously insecure, and society so unorganized that the courts of justice could not be relied upon to deal with criminals. A man named Clifford, living at a place called Rendville, was called to his door on Saturday night, and shot down in cold blood. Richard Hickey and his son, owners of a liquor-shop in the neighborhood, were arrested on suspicion, and taken before a magistrate for a preliminary hearing. While the examination was going on, twelve masked men —not twelve enraged, or furious, or excited men, but twelve "silent, steady, masked men" —came in, took the case out of the magistrate's hands, put a rope round the younger criminal's neck, "hoisted" him, and then proceeded to conduct a preliminary examination of their own. This resulted in a speedy declaration by the young man that his father committed the crime. The elder Hickey was then "hoisted," but he protested his innocence, and was thereupon hoisted and rehoisted until he was strangled to death. It is not known who the lynchers were, but they are believed to be "peaceful and quiet citizens" who "thought the circumstances under which Clifford lost his life, in view of the uncertainty of the courts, required that speedy justice be done." There is "general regret," the despatch adds, that "this act of lawlessness occurred," but there are "few sympathizers" with Hickey.

The unfortunate point in the case is that it seems at least doubtful whether the old man committed the crime at all. The only explanation of the murder of Clifford is that a brother of his had recently married a daughter of old Hickey, and that he had subsequently said that he would rather have seen his brother dead in his coffin than married to her. This enraged the old man so that he at once murdered Clifford. It is evident, however, that this evidence is defective; for, assuming that such a remark is necessarily wiped out in blood by the family of the slighted girl, the act of vengeance is after all as likely to be executed by a brother as by a father, and so we are not surprised to find that another member of the family declares that an older son, who has since escaped, fired the shot.

If this were an isolated case, we should not think so much of it; but there have been recently several indications pointing to the prevalence of a feeling in some parts of the United States that lynching, on account of the difficulty of executing murderers, must be revived. In Colorado the other day, a woman was summarily tried and executed by a number of "silent, steady" neighbors—the first woman, it is said, ever lynched in that "section"; and within a few miles of New York a ruffian who had made a murderous assault, but had not actually taken life, was rescued from a crowd of lynchers with great difficulty. In all these cases, the lynching, successful or attempted, is the work of the neighbors, acting in a hasty but organized way, and therefore in a way that makes all talk of punishment idle. They resemble each other in springing from a feeling that the law is so uncertain, and the difficulty of hanging murderers so great, that lynching has "got to come." A return to the custom of lynching in civilized communities is, however, a vastly more serious matter than its temporary outbreak in a pioneer State. In California such work as was done by the vigilance committee was always looked upon as merely a temporary substitute for the regulated administration of justice by the courts. It was always treated in the press and even by foreign observers as destined to disappear as the community grew civilized. But a revival of lynching in the midst of magistrates, sheriffs, police, detectives, and courts of justice, regularly organized and dealing with crimes against the person, can only be talked about as a "remedy" for anything by those who take a very black view of our social condition. A revival of lynching can only be excused by the admission that the courts do not, for some reason, administer justice in criminal cases; or, in other words, that they positively encourage crime.

We actually do hear, in communities like New York and Ohio, the complaint that the law is in such a state that murderers cannot be hung. Here, for instance, owing to the great facility of appeal and technical defence, we have practically three trials—one with the jury, one in the Supreme Court, and one in the Court of Appeals—before we know whether there is even a good chance of a murderer being hung. This comes, apparently, from the fact that the Legislature, whenever it is appealed to to make the procedure in murder cases a little more complicated than it was before, invariably does it. The acts which it passes, it is true, usually attract little or no attention at the time they are passed, and their existence is often unknown to the public till they are brought out in the progress of some trial. They are often passed at the instance of the class of criminal lawyers who in our large cities make fortunes out of the delays in criminal cases, and are essentially "private" bills, designed for the exclusive benefit of murderers.

But such laws could not be passed or remain for an instant on the statute books of any community in which there was not a vast amount of latent sympathy with crime of this sort, and a very feeble feeling of the importance of punishing murder rapidly and in a way to enforce the lesson upon the criminal class. No such statutes get passed in England or France or Germany. There is nothing to prevent their repeal here, if we want to have them repealed. A revival of lynching, however, or the taking of the work of judge, jury, and executioner into private and volunteer hands is a singular way of correcting or removing the causes from which the trouble springs. It is not found necessary to lynch or administer private justice upon thieves, because there is no liking for theft in the community, and consequently none gets into the Legislature. Of course, if murderers are not punished by the courts they will be in other ways, but a revival of lynching, or the fact that lynching has "got to come" in a modern civilized State can only be looked upon as not a cheering sign of hope or progress, but as an awful warning. It has "got to come" in the same sense that the plague or cholera has got to come if we do not prevent its coming. If there is a "feeling abroad" as to the uncertainty of murder trials, why does it not find its way into the Legislature? May it not be said that the very fact that it does not tends to throw doubt on the existence of any such feeling, which is not removed by the exploits of "silent, steady," masked executioners, however usually quiet and peaceable?

DOCTORS IN COURT.

A VOLUME has just been privately printed in Pennsylvania by Dr. George L. Harrison, formerly President of the Board of Public Charities of that State, collecting all the legislation of the modern civilized world on the protection of the insane. Dr. Harrison is a lawyer and a philanthropist, and has made a special study of this subject in all its aspects. The result throws some light on one or two questions of considerable interest to the public and the medical profession, in connection not only with the protection of the insane, but with expert testimony as to insanity.

A generation ago there was comparatively little indication in the laws relating to insanity of any prevalent dread of intrusting the decision of the fact of insanity to physicians. The general view was that the certificate of two or three doctors to a man's being out

of his mind was reason enough for shutting him up, and taking away his property from him. When an English novelist undertook to show that such a system might lead to terrible consequences, what he said was generally thought in this country to be the exposure of an English abuse, and to have little application to the United States. But Dr. Harrison says that precisely this abuse is to be found in Pennsylvania to-day. He gives several cases which have come under his own observation. In one of these a boy, perfectly sane, but suffering from the effects of an amputation, was locked up in an asylum, and was nearly driven crazy when he discovered where he was. He was released, and is now earning a living and married. In two of the cases, the patients were, properly speaking, kidnapped by the doctors; an attempt to inquire into their conduct in one of them came to nothing. In another, a man of considerable means was caught, shut up for nine months in a "retreat," at a distance from his friends, who did not know where he was. His property was handed over to a committee, and it was not till after nine months that he managed to obtain his liberty again. When the matter came up in court it appeared that the only ground for thinking him insane, even after he reached the hospital, was his habit of walking up and down the corridors and talking about himself.

Such are the results of leaving the right to decide the fact of insanity to physicians, and the tendency of legislation now is to insist upon a judge's decision in addition to that of the doctors. This is the law of Massachusetts to-day. In New York the judge is, as we understand it, not obliged by law to pass upon the question, but he has the right to do so, and generally now exercises it. A decision by him ought to be obligatory, as the question is not purely a medical one, and the doctors are in most cases paid for their certificate by some one who has an interest in depriving the patient of the control of his property. The question whether a man can take care of his property is a question which it is far safer to leave to any fair-minded lawyer, occupying a responsible position, than to a couple of casual alienists who may have been called in for this purpose, and who have at any rate the usual alienists' facility for finding lunacy in every case they examine.

The tendency which is thus exhibited in the laws of some States is found in the verdicts of juries in others. A curious illustration of this fact is given in the Meredith case in Philadelphia, in which the jury has just returned a verdict of sanity in the case of a gentleman who was proved to be subject to a delusion that he was "persecuted" by enemies—a strong indication of insanity—whose delusion was declared by the judge in his charge to "belong to a dangerous class or type," and who had, in consequence, been during most of the time since 1877 either "in actual confinement," or "under a moral restraint," and as to whom the experts testified that the removal of his restraint would cause his insanity to break out again. That the jury should have, under such circumstances, decided that Mr. Meredith was entitled to his liberty, could only have come from an entire disregard of the doctors' testimony. The distrust of medical testimony exhibited in this case is shown not only by juries, but by every good judge who has to pass upon it. He always nowadays warns the jury against the testimony of the doctors, as entitled to very little weight. The effect of the prevalent feeling on the subject is seen in all trials like the Meredith case, in all will contests, and generally in murder trials, though here it seems to be more than balanced by sympathy for the criminal. It is this sympathy which is at the root of the difficulty of getting criminals hung; but the doctors here come in to furnish a medical basis for a perjured verdict. As long as the prisoner, therefore, is allowed to introduce evidence on his own behalf—and how this is to be prevented it is difficult to see—the introduction of the State expert system, frequently recommended by writers who discuss this subject, will not avail much, although it will of course be an improvement. If physicians who give such evidence on the subject of insanity as we meet with every month or so now in criminal trials, are never punished either by their own profession or by the law, "experts" will continue to be produced for the purpose of giving a semblance of decency to verdicts of acquittal, and so long the prejudice against medical testimony in general will deepen.

THE RUMFORD MEDALLIST.

It is well understood that the "Rumford Medal" is about to be awarded by the American Academy of Arts and Sciences, in Boston, to Prof. Henry A. Rowland, of the Johns Hopkins University. Great as this honor is, it has been so rarely bestowed that the public may be excused for inquiring, "What is the Rumford Medal?" and "Why is it given to Rowland?" We shall try to answer these questions, though as to the former "the intelligent reader" will do well to turn for himself to the pages of Rumford's 'Life,' which was written by Dr. George E. Ellis a few years since.

On the 12th of July, 1796, nearly ninety years ago, that learned, humane, versatile, foresighted philosopher, who began his life as Benjamin Thompson, of New Hampshire, and ended it as Count Rumford of Bavaria, addressed two letters, in nearly the same words, to the Royal Society of London and the American Academy of Boston. Their purpose was to convey £1,000, or $5,000, to each of these scientific bodies, to be held as a fund, the income of which should be given every second year in premiums for important discoveries or useful improvements which might be published (within the two years previous) on heat or on light. If nothing should appear worthy of the prize, the premium was to be withheld and the income applied to the augmenting of the capital. One of the premiums was offered exclusively for discoveries made public in any part of Europe; the second, in any part of America.

During most of this century the Royal Society has had but little difficulty in discharging its trust. Rumford, Davy, and Brewster were among the first to receive the prize, and then there came a barren period, between 1818 and 1834, with but one fruitful year, when Fresnel was honored for his work on 'Polarized Light.' From 1846, onward, there is an unbroken series of biennial awards. A mere catalogue of the worthies who have thus been decorated suggests the history of modern physical research: Faraday, Regnault, Arago, Stokes, Pasteur, Kirchhoff, Tyndall, Jamin, Clerk Maxwell, Des Cloizeaux, Angström, Lockyer, Janssen, Cornu, Huggins, and Abney. In this country the task at first was not so easy, and no award was made during a period of more than forty years. In 1831 the difficulty of finding worthy competitors appeared so great, that the American Academy requested permission from the Legislature of Massachusetts, and finally obtained it, to use a part of the income for purposes akin to, but not identical with, those proposed by the founder of the prize. In 1839, for the first time, an award was made, and the Rumford Medal was bestowed on Robert Hare, of Philadelphia, for his invention of the compound blowpipe. Another barren period followed. At length, in 1862, Ericsson received the medal for his caloric engine; and in 1865 it was given to Professor Treadwell, of Harvard, "for improvements in the management of heat." It was next awarded, in 1867, to Alvan Clark, for his improvement in the telescopic lens. In 1870 it was given to George H. Corliss, of Providence, for improvements in the steam-engine. At a later day it was given to Dr. John W. Draper, of New York, for his discoveries in the theory of light. The latest award, prior to the current year, was to Prof. Willard Gibbs, of Yale College, for researches in thermo-dynamics.

All this is an old story, in which there happens to be a fresh interest because of the recognition now given to the work of Professor Rowland. As yet this is not well known to the public, for his printed statements in regard to it are brief and scattered, and have not yet permeated to the popular compendiums of science. But his inventions and discoveries are perfectly well known to physicists, for they have been repeatedly brought to the attention of learned societies at home and abroad. The admirable ruled surfaces, or "diffraction gratings," as they are commonly called, which were made by Mr. L. M. Rutherford, of New York, for spectrum analysis, have been for several years past among the most important instruments for investigations in respect to the nature of the sun's light. Mr. Rowland conceived the idea of improving these gratings, partly by making the surface on which they are ruled concave, and partly by a new and better method of ruling. He devised a new method of making the screw which guides the cutting diamond, and designed the whole dividing engine so as to obtain the highest accuracy. In both particulars he was successful. The machine worked so perfectly when it was first mounted for a trial, that it has never been taken down, but has steadily, by night and by day, pursued its accurate course. If he had paused here, after giving to the physicists of the world these gratings as instruments for further investigation, he would have made a grand contribution to physical science; but he did not rest content. He mounted his own gratings in a spectroscope of an original construction, in a room fitted up as a camera obscura, and there for two years past he has been making a photograph of the spectrum on a scale never before attempted. In this part of his work he has had the benefit of personal relations with Captain Abney, of the Royal Engineers, whose scientific researches in photography need only be alluded to. A photographic map of the spectrum is now well advanced toward publication, which will show to the world exactly what this invention has done.

One curious fact is worth adding. The scene of Professor Rowland's activity is a small "back-building" (as they call it in Baltimore), fitted up as a mechanic's shop, in Howard Street near the University. The screw which does the

ruling is down in a dark cellar where the temperature is nearly uniform, and the camera where the photographic work is carried on is the garret of an adjacent dwelling house. Nothing could be humbler than these unpretentious laboratories; but hither have come pilgrims from this and other lands—Cayley, Spencer, Sylvester, Carpenter, Newcomb, Hall, Young, Langley, Trowbridge, Draper, and many more, to watch with their own eyes the marvellous furrows of the little diamond plough, to wonder at the brilliant hues of the spectrum revealed by the grating, and to see the mysterious multitudes of lines which may be counted on the photographic plates.

We have referred to these researches on the solar spectrum because they are the most recent. It is probable, however (though we have not seen it so stated), that the award to Professor Rowland is based partly on a previous study of the mechanical equivalent of heat. In 1877 he began an investigation on this subject—after a preliminary study of thermometers, which was of importance—aided in the construction of a new instrument which he had invented by an appropriation from the Rumford fund of the American Academy. The main conclusion of his elaborate and original inquiry was a close confirmation of the value already announced by Joule. His paper on this subject was printed by the American Academy. A second paper, in which an elaborate review was made of all similar investigations, was honored with a premium from an Academy in Venice, and printed there. It is only just to add that the work of Professor Rowland has been generously encouraged by the Trustees of the Johns Hopkins University, who have given him ample pecuniary support, and have allowed him abundant freedom for the prosecution of his great research.

WENDELL PHILLIPS.

LIKE so many eminent men in New England, Mr. Phillips traced his line of descent to a Puritan clergyman—in this case the Rev. George Phillips, first minister of Watertown, Mass. From him was descended, in the fifth generation, John Phillips, first Mayor of Boston, who was chosen in 1822, a sort of compromise candidate between Harrison Gray Otis and Josiah Quincy, who equally divided public favor. John Phillips is credited by tradition with "a pliable disposition," which he certainly did not transmit to his son. He was a graduate of Harvard College in 1788, held various public offices, and was for many years "Town Advocate and Public Prosecutor," a function which certainly became, in a less official sense, hereditary in the family. He was a man of wealth and reputation; and he built for himself a large mansion, which is conspicuous in the early engravings of Boston, and which is still standing at the lower corner of Beacon and Walnut Streets. There Wendell Phillips was born November 29, 1811. He was thus placed by birth in the most favored worldly position, the whole Phillips family being rich and influential, at a time when social demarcations were more distinct than now. He was, however, brought up wisely, since John Phillips made this rule for his children: "Ask no man to do for you anything that you are not able and willing to do for yourself." Accordingly his son claimed in later life that there was hardly any kind of ordinary trade or manual labor used in New England at which he had not done many a day's work. He attended the Boston Latin School, entered Harvard College before he was sixteen, and was graduated (in 1831) before he was twenty, in the same class with Motley, the historian. Both of them had personal beauty, elegance, and social position; and Mr. Phillips always readily testified that both of them had certain narrow prejudices which he outgrew very soon, and Motley in the end.

It is rare for any striking career to have a dramatic beginning; but it may be truly said of Wendell Phillips that his first recorded speech established his reputation as an orator, and determined the career of his life. Being graduated at the Cambridge Law School in 1833, he was admitted to the bar in 1834. In 1835 he witnessed the mobbing of Garrison; in 1836 joined the American Anti-Slavery Society. In 1837 occurred the great excitement which raged in Congress around John Quincy Adams when he stood for the right of petition; and in November of that year Elijah P. Lovejoy was murdered at Alton, Ill., while defending his press from a pro-slavery mob. The Rev. Dr. Channing and others asked for the use of Faneuil Hall for a meeting to express their indignation; the city authorities refused it; Dr. Channing then wrote an appeal to the citizens of Boston, and the authorities yielded to the demand. At the Faneuil Hall meeting Jonathan Phillips, a wealthy citizen and a second cousin of Wendell Phillips, presided; Dr. Channing spoke, and then two young lawyers, Hallett and Hillard. James Trecothick Austin, Attorney-General of the State, then took the platform, and his speech soon proved the meeting to be divided on the main question, with a bias toward the wrong side. He said that Lovejoy died as the fool dieth, and compared his murderers to the men who threw the tea into Boston Harbor. The meeting broke into applause, and seemed ready to go with Austin, when Wendell Phillips came on the platform amid hisses that scarcely allowed him to be heard. Almost at his first words he took the meeting in his hands, and brought it back to its real object. "When I heard," he said, "the gentleman lay down principles which placed the murderers of Alton side by side with Otis and Hancock, with Quincy and Adams, I thought these pictured lips (pointing to their portraits) would have broken into voice to rebuke the recreant American, the slanderer of the dead." From that moment the tide was turned, the meeting carried, the oratorical fame of Wendell Phillips secured, and his future career determined. From this time forward, and while slavery remained, he was first and chiefly an abolitionist; all other reforms were subordinate to this, and this was his life. To this he sacrificed his social position, his early friendships, his professional career. Possessing a sufficient independent property, he did not incur the added discomfort of poverty; but, being rich, he made himself as it were poor through life; reduced his personal wants to the lowest terms, earned all the money he could by lecturing, and gave away all that he could spare.

He was fortunate in wedding a wife in perfect sympathy with him—Miss Ann T. Greene—and indeed he always said that her influence first made him an abolitionist. A life-long invalid, rarely leaving her room, she had yet such indomitable courage, such keenness of wit, such insight into character that she really divided with him the labors of his career. It is impossible for those who knew them both to think of him without her; it is sad to think of her without him. They lived on Essex Street in a region almost deserted by residences and given over to shops; the house was plain and bare, without and within; they had no children, and, except during the brief period when their adopted daughter was with them, the home seemed almost homeless outside of the walls of Mrs. Phillips's apartment. There indeed—for her husband and her few intimates—peace and courage ruled, with joy and hilarity not seldom added. But for many years Mr. Phillips was absent a great deal from home on his lecture tours, though these rarely extended Westward or over very long routes. Both he and his wife regarded these lectures as his main mission; for, even if he only spoke on "The Lost Arts" or "Street Life in Europe," it gave him a personal hold upon each community he visited, and the next time, perhaps, an anti-slavery lecture would be demanded, or one on temperance or woman's rights. He always claimed this sort of preliminary influence, in particular, for his lecture on Daniel O'Connell, which always secured for him a great following among our Irish fellow-citizens, at a time when they were bitterly arrayed against the anti-slavery movement.

Unlike his coadjutor, Edmund Quincy, Wendell Phillips disavowed being a non-resistant. That scruple, as well as the alleged pro-slavery character of the Constitution, precluded most of the Garrisonian abolitionists from voting or holding office, but Phillips was checked by his anti-slavery convictions alone. This fact made him, like Theodore Parker, a connecting link between the non-resistants and the younger school of abolitionists who believed in physical opposition to the local encroachments, at least, of the slave power. They formed various loosely-knit associations for this purpose, of which he was not a member; but he was ready with sympathy and money. In one of their efforts, the Burns rescue, he always regretted the mishap which for want of due explanation threw him on the side of caution, where he did not belong. At the Faneuil Hall meeting, which it was proposed to transfer bodily to Court Square, Theodore Parker was notified of the project, but misunderstood the signal; Wendell Phillips was never even notified, for want of time, and was very unjustly blamed. It is doubtful whether he was, in his very fibre, a man of action; but he never discouraged those who were such, nor had he the slightest objection to violating law where human freedom was at stake. A man of personal courage he eminently was. In the intense and temporary revival of the mob feeling in Boston, in the autumn and winter of 1860, when a John Brown meeting was broken up by the same class of "gentlemen of property and standing" who had mobbed Garrison, Wendell Phillips was the object of special hostility. He was then speaking every Sunday at the Music Hall, to Theodore Parker's congregation, and was each Sunday followed home by a mob, while personally defended by a self-appointed body-guard. On one occasion the demonstrations were so threatening that he was with difficulty persuaded to leave the hall by a side entrance and was driven to his home with a fast horse by the same Dr. David Thayer who watched his dying bed. For several nights his house was guarded by a small body-guard of friends within and by the police without. During all this time there was something peculiarly striking and characteristic in his demeanor. There was absolutely nothing of bull-dog combativeness; but a careless, buoyant, almost patrician air, as if nothing in the way of mob violence were worth considering, and as if all threats of opponents were simply beneath contempt; he seemed like some English Jacobite cavalier on the scaffold, carelessly taking snuff and kissing his hand to the crowd before laying his head upon the block.

No other person than Garrison could be said to do much in the way of guiding the "Garrisonian" anti-slavery movement; and Wendell Phillips was thoroughly and absolutely loyal to his great chief. In the details of the agitation, perhaps the leading organizers and strategists were two remarkable women, Maria Weston

Chapman and Abby Kelley Foster. The function of Wendell Phillips was to supply the eloquence; but he was not wanting either in grasp of principles orinterest in details. He thoroughly accepted the non-voting theory, and was ready not only to speak at any time, but to write, which he found far harder, in opposition to those abolitionists, like Lysander Spooner, who were always trying to prove the United States Constitution an anti-slavery instrument. His "The Constitution a Pro-Slavery Compact" (1844), though almost wholly a compilation from the Madison papers, was for many years a storehouse of argument for the disunion abolitionists; and it went through a series of editions.

In later life he often wrote letters to the newspapers, in which he did not always appear to advantage. But he did very little writing on the whole; it always came hard to him, and he had, indeed, a theory that the same person could never succeed both in speaking and writing, because they required such different habits of mind. Even as to reports of his speeches he was quite indifferent, and it was rather hard to persuade him to interest himself in the volume of 'Speeches, Lectures, and Essays,' which was prepared by James Redpath in 1863. The editor was a good deal censured at the time for retaining in these speeches the expressions of applause or disapprobation which appeared in the original newspaper reports, and which Mr. Phillips had erased. It is, however, fortunate that he did so; it not only increases their value as memorials of the time, but it brings out that close contact and intercommunion with his audience which was an inseparable part of the oratory of Wendell Phillips. He also published "The Constitution a Pro-Slavery Compact" (1844); "Can Abolitionists Vote or Take Office?"(1845); "Review of Spooner's Constitutionality of Slavery" (1847), and other similar pamphlets. He also showed real literary power and an exquisite felicity in the delineation of character in his memorial tributes to some of his friends, as, for instance, the philanthropist Mrs. Eliza Garnaut, of Boston, whose only daughter (now Mrs. G. W. Smalley, of London) he afterward adopted.

The keynote to the oratory of Wendell Phillips lay in this: that it was essentially conversational—the conversational raised to its highest power. Perhaps no orator ever spoke with so little apparent effort or began so entirely on the plane of his average hearers. It was as if he simply repeated in a little louder tone what he had just been saying to some familiar friend at his elbow. The effect was absolutely disarming. Those accustomed to spread-eagle oratory felt perhaps a slight sense of disappointment. Could this quiet, easy, effortless man be Wendell Phillips? But he held them by his very quietness; it did not seem to have occurred to him to doubt his power to hold them. The poise of his manly figure, the easy grace of his attitude, the thrilling modulation of his perfectly trained voice, the dignity of his gesture, the keen penetration of his eye, all aided to keep his hearers in hand. The colloquiation was never relaxed, but it was familiarity without loss of keeping; when he said "isn't" and "wasn't," or even, like an Englishman, dropped his g's and said "bein'" and "doin'," it did not seem inelegant; he might almost have been ungrammatical and it would not have impaired the fine air of the man. Then, as the argument went on, the voice grew deeper, the action more animated, and the sentences would come in a long sonorous swell, still easy and graceful, but powerful as the soft stretching of a tiger's paw. He could be terse as Carlyle; or his sentences could be as prolonged and cumulative as those of Choate or Evarts; no matter, they carried the same charm. He was surpassed by Garrison in grave moral logic; by Parker, in the grasp of facts, and in merciless sarcasm; by Sumner, in copiousness of illustration; by Douglass, in humor and in pathos; but after all, in the perfect moulding of the orator, he surpassed not merely each of these, but all of them combined. What the Revolutionary orators would now seem to us we cannot tell, but it is pretty certain that of all our post-Revolutionary orators, save Webster only, Wendell Phillips stood at the head; while he and Webster represented types of oratory so essentially different that any comparison between them is like trying to compare an oak-tree to a pine.

He was not moody or variable, or did not seem so; yet he always approached speaking with a certain reluctance, and never could quite sympathize with the desire to listen either to him or to any one else. As he walked toward the lecture room he would say to a friend, "Why do people go to lectures? There is a respectable man and woman; they must have a good home; why do they leave it for the sake of hearing somebody talk?" This was not affectation, but the fatigue of playing too long on one string. Just before coming on the platform at a convention he would remark with absolute sincerity, "I have absolutely nothing to say"; and then would go on to make, especially if hissed or interrupted, one of his very best speeches. Nothing spurred him like opposition, and it was not an unknown thing for one of his young admirers to take a back seat in the hall to stimulate him by a counterfeited hiss if the meeting seemed too tame. Then the unsuspecting orator would rouse himself like a lion. Again, when this opposition came not from friends but foes, it was peculiarly beneficial; and perhaps the greatest oratorical triumph he ever accomplished was on that occasion in Faneuil Hall (January 30, 1852), when it was reopened to the abolitionists after the capture of the slave Thomas Sims. Mr. Webster's friends were there in force, and drowned Mr. Phillips's voice by repeated cheers for their favorite, when Mr. Phillips so turned the laugh against them each time, in the intervals when they paused for breath, that their cheers grew fainter and fainter, and he had at last mobbed the mob.

He used to deny having trained himself for an orator; drew habitually from but few books, Tocqueville's 'Democracy in America' being among the chief of these; but read newspapers enormously, and magazines a good deal; while he had the memory of an orator or a literary man, never letting pass an effective anecdote or a telling fact. These he turned to infinite account, never sparing ammunition and never fearing to repeat himself. He used to say that he knew but one thing thoroughly—the history of the English Revolution—and from this he obtained morals whenever he wanted them, and, to tell the truth, used them in almost any direction. He knew the history of the American Revolution also; Sam Adams being his favorite hero. He was a thorough Bostonian too; and his anti-slavery enthusiasm never rose quite so high as when blended with local patriotism. No one who heard it can ever forget the thrilling modulation of his voice when he said, at some special crisis of the anti-slavery agitation: "I love inexpressibly these streets of Boston over whose pavements my mother held up tenderly my baby feet, and, if God grants me time enough, I will make them too pure to bear the footsteps of a slave." At the very outset he doubtless sometimes prepared his speeches with care, but his first great success was won off-hand, and afterward, during that period of incessant practice, which Emerson makes the secret of his power, he relied generally upon his vast accumulated store of facts and illustrations, and his tried habit of thinking on his legs. On special occasions he would make preparation, and sometimes, though rarely, wrote out his speeches beforehand. No one could possibly recognize this, however; he never seemed more at his ease, more colloquial, more thoroughly extemporaneous than in his remarkable address before the Phi Beta Kappa Society at Cambridge; yet it had all been sent to the Boston daily papers in advance, and appeared with scarcely a word's variation, except where he had been compelled to omit some passages for want of time. That was, in some respects, the most remarkable effort of his life; it was a tardy recognition of him by his own college and his own literary society; and he held an unwilling audience spell-bound, while bating absolutely nothing of radicalism. Many a respectable lawyer or divine felt his blood run cold next day when he found that the fascinating orator whom he had applauded to the echo had really made the assassination of an emperor seem as trivial as the doom of a mosquito.

He occupied during most of his life the willing position of a tribune of the people; nor was there any class with which he was unwilling to be, logically and politically at least, identified. Emerson, while thoroughly true to the anti-slavery movement, always confessed to feeling a slight instinctive aversion to negroes; Theodore Parker uttered frankly his dislike to the Irish. Yet neither of these had distinctly aristocratic impulses, while Phillips had. His conscience set them aside so imperatively that he himself hardly knew that they were there; he was always ready to be identified with the colored people; always ready to give his oft-repeated lecture on O'Connell to the fellow-countrymen of that hero; but in these and all cases his democratic habit had the good-natured air of some kindly young prince; he never was quite the equal associate that he seemed. The want of it never was seen by his associates; it was in his dealing with his antagonists that the real attitude came out. When he once spoke contemptuously of those who dined with a certain Boston club which had censured him, as "men of no family," the real mental habit came out. And in his external aspect and bearing the patrician air never quite left him—the air that he had in college days, or in that period when, as Edmund Quincy delighted to tell, an English visitor pointed out to George Ticknor two men walking down Park Street, and added the cheerful remark, "They are the only men I have seen in your country who looked like gentlemen." The two men were the abolitionists Quincy and Phillips, in whose personal aspect the conservative Ticknor could see little to commend.

There is no fame so intoxicating or so transient as that of mere oratory. Some of the most accomplished orators whom America has produced have died within a few years in mid-career and left scarcely a ripple on the surface. Two of these, to name no others, were ex-Governor Bullock, of Massachusetts, and Professor Diman, of Rhode Island. Neither of them had the fortune to be identified with any great moral enterprise or to stand before the public for a long time and be the mouthpiece of its indignation or its aims. It was not chance that gave this position to Wendell Phillips. A great many elements of genius, studies, social prestige, and moral self-sacrifice had to be combined to produce it. It never turned his head; his aims were too high for that, and he was aided by the happy law of compensation, which is apt to make men indifferent

to easily-won laurels. There is no doubt that, in the height of his fame as a lecturer or platform speaker, he often chafed under the routine and the fatigue; and felt that, had not fate or Providence betrayed him, his career would have been very different. He felt that, coming forward into life with his powers and at the time he did, he might easily have won the positions which went easily to men less richly endowed—as Abbott Lawrence and Robert C. Winthrop; and that, had he been once within the magic circle of public office, he could have used it for noble ends, like his favorite, Sir Samuel Romilly. "What I should have liked," he said once to a friend, "would have been the position of United States Senator for Massachusetts"; and though he never even dreamed of this as possible for himself, he saw his friend Sumner achieve a position which he himself, could he once have accepted its limitations, might equally have adorned.

It is impossible to say how office might have affected him; whether it would have given him just that added amount of reasonableness and good judgment which in later years seemed often wanting, or whether it would have only betrayed him to new dangers. He never had it; and the arduous life-long habits of the platform told upon him. The platform speaker has his especial dangers as conspicuously as the lawyer or the clergyman; he acquires insensibly the habit of a gladiator, and the better his fencing the more he becomes the slave of his own talent. *Les hommes exercés à l'escrime ont beau vouloir ménager leur adversaire, l'habitude est plus fort, ils ripostent malgré eux.* As under this law the Vicomte de Camors seduced, almost against his will, the wife of the comrade to whom he had pledged his life, so Wendell Phillips, once with rapier in hand, insensibly fought to win as well as for the glory of God. The position once taken must be maintained—the opponent must be overwhelmed by almost any means. No advocate in any court was quicker than he to shift his ground, to introduce a new shade of meaning, to abandon an obvious interpretation and insist on a more subtle one. Every man makes mistakes; but you might almost count upon your ten fingers the number of times that Wendell Phillips, during his whole lifetime, owned himself to be in the wrong or made a concession to an adversary. In criticising his career in this respect, we may almost reverse the celebrated censure passed on the charge of the Six Hundred, and may say that it was not heroic, but it was war.

If this was the case during the great contest with slavery, the evil was more serious after slavery fell. The civil war gave to Phillips, as it gave to many men, an opportunity, but it was not, in his case, a complete opportunity. At first he was disposed to welcome secession, as fulfilling the wishes of years; "to build," as he said, "a bridge of gold for the Southern States to walk over in leaving the Union." This mood passed, and he accepted the situation, aiding the departing regiments with voice and purse. Yet it was long before the war took a genuinely anti-slavery character, and younger men than he were holding aloof from it for that reason. He distrusted Lincoln for his deliberation and believed in Fremont; in short, for a variety of reasons, took no clear and unmistakable attitude. After the war had overthrown slavery, the case was even worse. It was a study of character to note the differing demeanors of the great abolitionist leaders after that event. Edmund Quincy found himself wholly out of harness, *désœuvré;* there was no other battle worth fighting. He simply reverted for the rest of his life to that career of cultivated leisure from which the anti-slavery movement had wrenched him for forty years; he was a critic of music, a frequenter of the theatres. Garrison, on the other hand, with his usual serene and unabated vigor, went on contending for the rights of the freed men and of women, as before for those of the slaves. Unlike either of these, Wendell Phillips manifested for the remainder of his life a certain restlessness; always seemed to be crying, like Shakspere's *Hotspur,* "Fye upon this idle life!" and to be always seeking for some new tournament. This would not perhaps have been an evil had he not carried with him into each new enterprise the habits of the platform, and of the anti-slavery platform in particular. There never was a great moral movement so logically simple as the anti-slavery reform; once grant that man could not rightfully hold property in man, and the intellectual part of the debate was settled; only the moral appeal remained, and there Wendell Phillips was master, and could speak as one having authority. Slavery gone, he found himself thrown, by his own life-long habit, into a series of new reforms, where the questions involved were wholly different and at a different stage of development. You could not settle the relations of capital and labor off-hand, by saying, as in the case of slavery, "Let my people go"; the matter was far more complex. It was like trying to adjust a chronometer with no other knowledge than that won by observing a sun-dial. In dealing with questions of currency it was still worse. And yet Wendell Phillips went on, for the remainder of his life, preaching crusades on these difficult questions, which he gave no sign of ever having seriously studied, and appealing to prejudice and passion as ardently as if he still had three million slaves for whom to plead.

It was worse still when, with the natural habit of a reformer, he found himself readily accepting the companionship into which these new causes brought him. The tone of the anti-slavery apostles was exceedingly high, but there were exceptions even there. "He is a great scoundrel," said Theodore Parker of a certain blatant orator in Boston, "but he loves liberty." It was true and was fairly to be taken into account. You do not demand a Sunday-school certificate from the man who is rescuing your child from a burning house. But it is to be said, beyond this, that though the demagogue and the true reformer are at opposite extremes, they have certain points in common. Society is apt to make them both for a time outcasts, and outcasts fraternize. They alike distrust the staid and conventional class and they are distrusted by it. When a man once gets in the habit of measuring merit by martyrdoms, he discriminates less closely, and the best abused man, for whatever cause, seems nearest to saintbood. Mr. Phillips, at his best, had not always shown keen discrimination as a judge of character; and the fact that the Boston newspapers thought ill of General Butler, for instance, was to him a strong point in that gentleman's favor. In this he showed himself less discriminating than his old associate Stephen Foster, one of the most heroic and frequently-mobbed figures in anti-slavery history; for Stephen Foster sat with great reluctance to see Caleb Cushing mobbed and silenced in Faneuil Hall by his own soldiers, after the Mexican war; and only lamented that so good a mob, which might have helped the triumph of some good cause, should be wasted on so worthless a creature as he. Fortunate it would have been for Wendell Phillips if he had gone no further than this; but he insisted on arguing from the mob to the man, forgetting the people may be censured as well for their sins as for their virtues. The last years of his life thus placed him in close coöperation with a man whose real motives and methods were totally unlike his own; indeed, the most unscrupulous soldier of fortune who ever posed as a Friend of the People on this side the Atlantic.

But all these last days, and the increasing irritability with which he impulsively took up questions to which he could contribute nothing but courage and vehemence, will be at least temporarily forgotten now that he is gone. They will disappear from memory like the selfishness of Hancock or the vanity of John Adams in the light of a devoted, self-sacrificing, and courageous career. With all his faults, his inconsistencies, his impetuous words, and his unreasoning prejudices, he belonged to the heroic type. Whether we regard him mainly as an orator or as a participant in important events, it is certain that no history of the United States will ever be likely to omit his name. It is rarely that any great moral agitation bequeaths to posterity more than two or three names; the English slave-trade abolition has left only Clarkson and Wilberforce in memory; the great Corn Law contest only Cobden and Bright. The American anti-slavery movement will probably embalm the names of Garrison, Phillips, and John Brown. This is for the future to decide. Meanwhile, it is certain that Wendell Phillips had during life that quality that Emerson thought the highest of all qualities—of being "something that cannot be skipped or undermined." Now that he is gone, even those who most criticised him will instinctively feel that one great chapter of American history is closed.

A LIVERPOOL ART GALLERY.

LONDON, January 16.

OF the thousands of travellers weekly passing through Liverpool, scarcely one in a month finds his way to the Gallery of Art of the Royal Institution. Indeed, it requires some perseverance to arrive there; for, of the inhabitants of the town, and even of the policemen, few know the whereabouts of the place, and the enterprising person who eventually reaches the door (unless indeed it be on a Monday) probably finds it closed and the building apparently deserted. Let him, nevertheless, ring, and boldly walk up stairs, asking no questions, for there are pictures hanging upon the four walls of the main room on the first floor that are well worth an hour's inspection.

The history of this little neglected gallery might be told in a few words, were it worth while, but a hurried reader will be thankful to be introduced at once to the paintings themselves. Of these, there are some hundred and fifty or more, many of them indifferent, many interesting only historically; there remains, however, a residuum of real excellence. The two or three Byzantine paintings of the twelfth and thirteenth centuries, rare though such works are in the galleries of Europe, belong, perhaps, to the historically interesting class, and the same may be said of a mutilated panel painted with a "Coronation of the Virgin" by Lippo Memmi; but the little *tempera* painting by his brother-in-law, Simone Martini (signed and dated 1342), cannot fail to afford delight as well as to awaken interest. "Two surpassing painters have I known," said Petrarch; "Giotto, the Florentine, whose fame is great among the moderns, and Simone, of Siena." It was at the Court of the Popes at Avignon that the poet met Simone, and there he painted the portrait of Laura, described in more than one of the sonnets. During the painter's residence at Avignon he made the little Liverpool picture; and of all his smaller works it is not only the best preserved, but it is the one

that represents in highest perfection the lyrical beauty of the artist's thought. It shows us the boy Christ brought back by his father from among the Doctors to where the weary Virgin sits, reading for consolation in her Book of Devotion. But the charm of the little picture lies almost as much in the beautiful finish of the decorative adjuncts, the minute colored mouldings, the cusped canopy, the punctured halos of varied pattern on the gold ground, as in the graceful and expressive figures.

Of Giotto, likewise, the gallery possesses a reminiscence in the shape of certain portions of fresco, cut from the walls of the Carmine, at Florence, the year before the conflagration took place by which all except the famous Brancacci Chapel was destroyed. Vasari says that the frescoes were by Giotto, but it is not impossible that in this, as in so many other statements, Vasari was wrong. At all events these saved portions are judged, by common consent, to be the work of pupils, from the design of the master, perhaps, and, it may be, executed under his eye. The most pleasing of the pair represents a group of women holding baby John the Baptist, rolled up in a bundle; the dumb parent does not appear, but can be readily supplied by the imagination. Of two predella panels, from some altar-piece, one is obviously the handiwork of Fra Filippo Lippi himself, and represents an incident not without its charms for the romantic monk. A Bishop and a young lady sit together at a table eating and drinking; she, we are given to understand, has procured an invitation from him by certain unholy blandishments, and, indeed, the two black horns that find their way through her golden hair proclaim her character plainly enough to be the reverse of angelic. The pious Bishop is on the high road to ruin. Providentially, however, St. Andrew knocks at the door of the room, and the machinations of the fiend are brought to nought. In execution the work is most carefully done, the colors are tenderly handled and harmonious, and the most carnal spectator must admit that the expressions of the faces, especially that of the serving-lad, are remarkably naïve. A bust portrait of a lady is interesting, because it was cut from the wall of the Riccardi Palace at Florence, and may well depict some member of the Medici family, who formerly dwelt there. As to its authorship there are various opinions, the name of Botticelli being mentioned, not without a show of reason.

The latest picture of importance, belonging to the Florentine school, is a Madonna and Child, undoubtedly by Luca Signorelli. It is not one of the best of the works of that powerful but unequal master, and, besides, it has been a good deal rubbed; nevertheless, it is instinct with the force and vigor which he never failed to manifest in every creation of his brush.

Far more beautiful is a predella panel painted with a "Birth of St. John Baptist," by the little-known but most accomplished Umbrian artist, Fiorenzo di Lorenzo. The execution possesses the qualities of patience and delicacy, and the design is marked by the felicity and tenderness that have rendered famous the panels which once formed the treasury doors of the Church of S. Francesco, and are now preserved in the gallery at Perugia. The women are of peculiarly sweet and affectionate type. Their drapery is gracefully arranged and harmoniously colored. The lights upon the folds are drawn in fine lines of gold with great good taste.

Of pictures belonging to the school of Siena in the fifteenth century, there are two worthy of note. The first of these, probably the work of Francesco di Giorgio, is a picture which has been much discussed by historians. It represents the "Preaching of St. Bernardino of Siena," and contains the portraits, on a small scale, of several members of the Medici family. The figures are in many cases badly drawn and the buildings are in bad perspective; nevertheless the panel is of rare value, enabling us as it does to enter a mediæval church, and watch the behavior of a congregation listening to the words of a famous mediæval saint. Bernardino stands in the little four-legged pulpit he used to take about with him, and is in the act of displaying to the people one of his little tablets with the monogram I.H.S. The women are separated from the men by a curtain, which, however, is not too high to prevent a young dandy from taking up a good position of observation. Most of the people are kneeling before the little six-inch-high benches, which are all the sitting accommodation provided. The devout are not ashamed to give visible expression to their feelings, old ladies being particularly fervent. Many, both men and women, look about them and chatter, and some ladies who are just coming in, have all their attention concentrated on their own personal appearance. No attempt is made to keep the children in order. At the moment chosen by the painter, the preacher is pausing in his address, and trumpeters are blowing a blast to herald the entrance of the magnates of the town. The other Sienese picture is a "Madonna with Angels," probably by Matteo da Siena. The loving Virgin and her crouching babe, with the lily-bearing Gabriel and the reverently inquisitive little John, are fascinatingly grouped together, while the tasteful use of gold adds to the attractions of the well-combined colors. An excellent reproduction of this picture appeared in the *Portfolio* about two years ago.

The best represented of the Italian schools is undoubtedly the Venetian. Even in Venice such an altar-piece as the "St. Mark with Four Saints" is rare. It was painted by one of the earliest-settled Venetian artists, and belongs, properly speaking, to the school of Murano. The manner of the coloring is altogether that of the Umbrian Gentile da Fabriano, who for some years resided in Venice in the service of the town; the type of the figures, on the other hand, shows unmistakable traces of German influence. The picture is thus of great value, marking as it does the exact point of departure of true Venetian art, which united the strength of the North and the grace of the South to the rich coloring of the East. By Mantegna's marriage with the sister of Gentile and Giovanni Bellini, the influence of the learned and scientific school of Padua was brought to bear upon the rising artists of Venice; and it is probable that it was owing to this influence that the Bellini were enabled to overcome their rivals, the Vivarini, and thus to determine the line of development which led through Giorgione and Titian to Tintoret and Veronese. In such connection the presence of a finely-finished though rather damaged "Pietà," not indeed by Mantegna, but by his close imitator, Ercole Roberti di Antonio, is of especial interest. It shows, indeed, the influence of Giovanni Bellini, but the Paduan factor is so visible in it that it may well be taken (for want of a purer type) as an example of the Paduan element, which formed the final ingredient that went to make the Venetian school. A genuine and most excellent example of the work of Giovanni Bellini is a "Portrait of a Venetian Gentleman," duly signed and in good preservation. The rather weak brow of the youth is surmounted by a black cap of the shape fashionable at the day. He wears a black waistcoat and a cloak of dark green, bordering on black. The only bright color in the picture is the blue of the sky, with its white cumulus clouds; nevertheless there is a richness of tone and texture about the whole that marks it unmistakably as the work of a great colorist. Giovanni's less important followers—Pietro degli Ingannati, Vincenzo Catena, and the like—are well represented, but their pictures are of secondary importance. First rate, however, is the "Holy Family with S. Margaret in a Landscape," by one of the three Bonifazios—probably by him called, in Morelli's now classical work, Bonifazio Veneziano. It is a beautiful human family, grouped happily together among the flowers, the prettiest young mother, and the sweetest of babes, who playfully lays a garland of flowers upon the glorious golden hair of kneeling Margaret. The child John would gladly join in the play, and the Virgin looks musingly toward him as he reaches forward. Pet goldfinches are on the marble base of a ruined column, and pet rabbits sit in solemn discussion on the grass. The whole is painted with perfect skill and perfect ease. A more ideal work it would be possible to find, but not one fuller of refinement, gentleness, and quiet joy.

But the Venetian painter best represented is Tintoret. The study for the "Paradise" in the Ducal Palace at Venice is alone worth a day's journey to see. At Paris and Madrid are other studies for the same great work, but the Liverpool canvas is the most important of them all, because in it the conception of Paradise as a solid sphere of seraph-borne blessed ones, ranged about the central glory, makes its first appearance. The sketch is wrought with wonderful speed and certainty of hand. It must have been begun and finished at a sitting. The colors are splashed in, yet no single touch of brush or finger has been directed by chance. Few forms are rendered, it may be, but every form is definite and true. Each figure (and there are multitudes of them) is recognizable and usually namable. Each face wears a definite expression. The whole is solidified by the master's extraordinary power in the handling of light, and animated by his unrivalled and almost terrific power. An "Entombment" (for the present in the meeting-room of the Royal Institution in the building on the other side of the street) is a finished work by the same painter. It is one of the most powerful conceptions of the final scene of the great tragedy. The figures are in a mysterious half-light, grouped about the tomb, their attitudes expressive of long pressure of suffering, culminating in despair. A vague glimmer of pallid light strikes weirdly athwart the group and adds to the woeful aspect of the whole. Dark rocks shut them in behind, and a dark sky envelops them above, and from out the gloom emerge only the cold forms of painful death and more painful life. A "Last Judgment" professes to be the painter's study for the well known colossal picture, in the Madonna del Orto at Venice (described not quite accurately in vol. ii. of 'Modern Painters' and in the Venetian Index in 'Stones of Venice'). It is really an early copy from that picture, but, owing to the present faded state of the original, its vast dimensions, and the dark position in which it hangs, the copy is of more than ordinary value to the student of Tintoret. A "Crucifixion," painted by some scholar of Paul Veronese's, is founded on Tintoret's picture in S. Cassiano at Venice, and is not without charm. The "Finding of Moses" is likewise a tolerable work of Veronese's school.

Of pictures by Northern artists the collection contains no inconsiderable number, and one or two of them are worth notice. First in order comes a "Descent from the Cross," ascribed to Roger van der Weyden, and certainly by a painter of his school. The two thieves upon the wings are identical with those in a unique engraving of a "Descent" by the "master of 1464," preserved at Hamburg, the remainder of the

engraving being copied from Roger's "Descent" at Madrid. A large picture of one of the same thieves is in the museum at Frankfort, so it is not impossible that that may be one of the wings of the Madrid picture; it is, at all events, from the hand of Roger. Two very interesting panels belong to the early Westphalian school, and are undoubtedly the wings of a "Crucifixion" in the National Gallery, close beside which hangs another panel, evidently by the same master. The Liverpool panels represent various incidents in the Passion of Christ, painted in a coarse but powerfully dramatic manner. No gallery would be complete without its Cranach, and this possesses at any rate one (a "Venus"), and possibly a second in the form of a portrait of a middle-aged woman "got up" in very juvenile fashion, and smiling forever at the usually empty room. Hans Baldung Grün is represented by an "Age and Youth," and there are several more school pictures, both of German and Flemish origin. One of the most remarkable panels in the gallery is painted with a Madonna of very Milanese type, but in colors and with accessories that can only have come from the Low Countries. It is almost the only picture painted by a Northern artist under Italian influence that cannot be called a failure. The little naked smiling boy, nestling so happily against his mother's breast, is one of the most charming productions of any school or period. A beautifully finished portrait of Marguérite de Valois, sister of Francis I., can be none other than the handiwork of François Clouet, called "Janet," though it is usually assigned to Holbein. The rich stuffs of the lady's garments are painted with extraordinary care and skill; every detail is finished to the last point of perfection, and, though the subject is not an interesting or beautiful person, the painter has treated her with such genius that she cannot fail to attract the eye of even the most casual spectator.

Of later pictures of the schools of Rembrandt, Rubens, and other Dutch and Flemish painters, there are several worth seeing, though possibly not worth going to see. There are also meritorious specimens of the English school—a self-portrait by Reynolds's pupil and biographer, Northcote, for instance, and a series of some dozen or more cartoons by Romney—but these and the like the visitor will have no difficulty in discovering for himself, if the paintings mentioned above prove attraction enough to draw him, when next he passes through Liverpool, to the neglected Gallery of Art of the Royal Institution. W. M. CONWAY.

Correspondence.

THE ISSUE OF PAPER MONEY.

TO THE EDITOR OF THE NATION:

SIR: In your recent criticism of the opinion expressed by Mr. Jackson Schultz, that the paper circulation of the country should be issued by the national Government instead of by private corporations, you cite as conclusive answers to the proposition, 1st, that to charge the Government with the duty of issuing paper currency is substantially to ask it to engage in the banking business on an immense scale; 2d, that the issue of paper money is left to the banks by all solvent governments, because it is only through the banks that the exact amount of paper needed by the country can be ascertained; 3d, that if the Government were to issue the paper money without doing a regular banking business of deposit and discount, the amount of circulation needed by the country would have to be determined either by Congress or by the Secretary of the Treasury.

I think I represent a large class of your readers willing to be enlightened on this subject, when I say that your arguments seem to me far from conclusive. The Government has been for years charged with the duty of issuing paper money, and now has about $346,000,000 of it outstanding. If without "engaging in the banking business on an immense scale" it can issue that amount, why not $376,000,000 more? Is it the amount of the issue which determines whether the Government is engaging in the banking business? If so, how are we to fix the point at which the issue ceases to be a legitimate function and becomes "engaging in the banking business on an immense scale"?

The most obvious answer to your second objection is, that the issue of paper money by the United States is the strongest possible evidence that at least one solvent government does not leave the issue of such money to the banks.

I think, too, you exaggerate the danger of allowing Congress to determine the amount of currency needed by the country. Until the amendment of the clause in the National Bank Law fixing the amount of the circulation, that question was under the control of Congress, and nevertheless the country was reasonably prosperous and made considerable progress in the payment of the national debt. Its determination will devolve upon Congress again when the bonded debt, and with it the national bank circulation, shall be extinguished. But as long as any portion of the bonded debt remains outstanding, the volume of the currency can be kept adjusted to the wants of the people by authorizing the Secretary of the Treasury either to anticipate the payment of bonds out of the surplus funds when that can be done to advantage (which is equivalent to saying when there is a demand for currency), or to loan the surplus funds upon the security of bonds deposited and *bearing no interest during such deposit*, which is substantially what is done now with the national banks—the principal practical difference being that the bonds deposited by the banks continue to draw interest. It is assumed that the demand for currency would never exceed the available surplus in the Treasury—an assumption which is justified by past experience.

The immediate advantage to the public at large to be derived from replacing the national-bank notes with United States notes must be apparent to every one. In order to redeem their outstanding notes, the banks would be obliged to surrender their bonds to that amount, the United States would save more than $11,000,000 annually in interest, and a number of offices would be rendered unnecessary. And all this would be effected without either inflation or contraction of the currency, and without any appreciable disturbance of values. When such an opportunity is offered to any government, stronger arguments than those advanced by you ought to be required to induce it to forego it.

J. CHAMBERLAIN.

BALTIMORE, January 18, 1884.

[In the first place, the Government never was, and is not now, "charged with the duty of issuing paper money." Its paper money now in circulation was issued for the purpose of making a forced loan in time of war, and the amount issued was determined solely by the needs of the Treasury. The greenbacks are, in other words, simply unredeemed promissory notes. In the second place, the Government can issue $1,000,000,000 greenbacks if it likes, but it cannot, we hold, make them legal tenders. But issuing them would not "be engaging in the banking business on an immense scale," inasmuch as the banking business consists in the receipt of money on deposit, and the lending of it to traders and others on interest. The issue of notes is not an essential part of the banking business. In the third place, the existence of the national banks *is* proof that this Government also does leave the issue of paper money to the banks, inasmuch as the national bank bills are the only paper money now in the country issued simply and solely as currency. In the fourth place, the extent of the danger to be apprehended from leaving the amount of the currency in the control of Congress, is, of course, as yet matter of opinion, and is only deducible from the past dealings of Congress with the currency, and from principles of human nature, and the experience of other countries. As a matter of fact, legislative power over the volume of the currency has always been abused in times of trouble.—ED. NATION.]

CHINESE AND ITALIANS.

TO THE EDITOR OF THE NATION:

SIR: If your correspondent, Mr. S. B. Wiggin, is justified in his belief that "no man ever heard any Californian propose a restriction of Italian immigration," although all Californians approve the restriction of Chinese immigration, Californians must discriminate with much more nicety than New Yorkers. For there are certainly many people in this State who would like to see both Chinese and Italian immigration prohibited—probably one-third of the voters of New York city would.

Many Italian laborers came to this place some two years ago to work on the West Shore Railroad and on the Amsterdam City Water Works. They were as a class industrious, sober, and very frugal, many of them eating little besides bread. But the sight of their industry and frugality was to some of our citizens the reverse of edifying. Italian industry and frugality were associated in the minds of those citizens with a low standard of living; and a low standard of living they look upon with that solemn disapproval which Mr. Arnold would think appropriate to their own low standard of morals and manners.

One day there was a squad of twenty or thirty Italians digging in one of our principal streets. There were some half-dozen English-speaking laborers looking on. As I was passing I heard one of these remark: "They're not like men at all; they're worse than the Chinese." The others agreed in a chorus. I stopped and looked to see what the matter was with the Italians. They were good-looking and able-bodied and were working hard; and yet they were not oppressed by their work, as was shown by their occasionally joking, laughing, and singing snatches of some ditty. It was quite clear that there was nothing the matter with them that these on-looking laborers were capable of discerning. The matter simply was that the Italians were *there*. Either of these English-speaking laborers would undoubtedly *second* a proposal for the restriction of Italian immigration. Probably no one of them ever "proposed" anything in his life. J. C. COZENS.

AMSTERDAM, N. Y., January 28, 1884.

PACIFIC COAST VIEW OF THE CHINESE.

TO THE EDITOR OF THE NATION:

SIR: It is an endless, as well as a thankless, task to answer the attacks upon the Chinese by California writers, for the reason that they dis-

dain evidence, and readvance refuted reasons or arguments as if they never had been met. Nevertheless, it is worth while to say a word now and then; for, though they succeed in obtaining foolish and unjust laws, we can at least keep them in mind of the fact that they have not gained the moral support of the rest of the nation.

Your contributor in the *Nation* of January 24, Mr. Samuel Bradley Wiggin, who considers his Eastern opponents "hide-bound fanatics," is evidently himself a fanatic of the first water. He hesitates at no extreme in his description of the Chinaman; he believes in no arguments in his favor. Yet he must have at hand abundant evidence contradicting every statement that he makes. He can find in any library, and in a great many houses of San Francisco, Mr. George F. Seward's book on 'Chinese Immigration,' giving the testimony of hundreds of reliable, intelligent people, collected by the State, proving the Chinese to be industrious and frugal *in every true sense* (Mr. Wiggin's observation, whatever it may mean), of good general habits, and, moreover, what may surprise him, cleanly as compared to the average Californian.

As to infanticide, he had only to be at the pains to inquire of any respectable and intelligent Chinaman (and there are plenty in San Francisco), and he would have received indubitable proof that destruction of female children is as uncommon among the Chinese of that city as among any other of its inhabitants. Probably he and his Eastern friend could not discriminate between boys and girls in Chinese dress. To them they would look alike. But, in any case, it would not be surprising to any but a monomaniac that the majority of the children in the streets should be boys. Yet on that slender suggestion, fortified by the extorted and probably half-understood admission of some irresponsible shopman, intent on conciliation, Mr. Samuel Bradley Wiggin makes an assertion to the whole American public which he should be ashamed on such evidence to whisper to his wife.

I have lately been living in California, and I did not find the unanimity against the Chinese which he represents. Every man that held an office, and every man that hoped to run for an office (and the latter class is unhappily uncommonly numerous in the State), and every man of the loafing class, whether he wore broadcloth or homespun, was indeed dead against John Chinaman. Those who had nothing to expect from the voters, and who aimed to advance their fortunes by industry, temperance, and frugality, were oftener in his favor than against him. But, as everybody knows, there are enough of the latter class united with those of the former, and aided by the activity of the anti-Chinese politicians, to carry the State against the Chinese with an apparent unanimity. There is no pretence of fair dealing in the public discussion of the subject, which no doubt in part accounts for this appearance of unity. The leading San Francisco papers will not publish an article on the Chinese side, or would not while I was in the country. I know of instances where the attempt was made in vain.

As for relative habits and morals, not to speak of the abundant evidence in favor of the Chinese in Mr. Seward's book, I know of household servants who, after the continuous and faithful labor of the day, walked four miles into town to attend an evening school, returning at midnight to be up and at work again by six in the morning. On the other hand, I saw in one of the best up-town streets of San Francisco two boys of ten and twelve, pinks of respectability, with gold watch-chains and shirt-studs, throwing pieces of brick and stone at a respectable Chinese house-servant who was walking in front of them, he vainly remonstrating. There were but few people in sight, but those few paid no attention other than to bestow a benignant smile upon the boys. I ventured also to remonstrate, and as I suggested a visit to a police station, and stood by until the Chinaman turned the corner, the amusement terminated for that time. Who corrupted the sense of right in those young gentlemen? Not Chinamen.

Mr. Samuel Bradley Wiggin's views about the Italians are an amusing commentary on his anti-Chinese sentiments. They also, it seems, are industrious and frugal, and undersell the lord of the land; but Mr. Wiggin naïvely consoles himself by reflecting that the Italian has a family, and he has "faith to believe that his children will be an improvement on their father," *i. e.*, *less* industrious and frugal, since that is the only charge he has against them.—Your obedient servant,

EDWARD CUNNINGHAM.

MILTON, MASS., January 26, 1884.

TO THE EDITOR OF THE NATION:

SIR: If you will allow me I would like to comment on an anti-Chinese letter published in the last number of the *Nation*. I will pass over the references to the Chinese as paupers and as coolies, and to the opinion expressed that they are not frugal, nor industrious, nor cleanly. I will take the writer at his word—that the conclusive argument against the Chinaman is that he does not come here to stay; that he *must* return to China, alive or dead. After learning from the writer of the many revolting characteristics of the Chinaman, one is disposed to think that the one redeeming feature of his immigration is, that he *does not* come here to stay. Now I do not like to see the good people of the Pacific coast grieve over the loss of their detested, yet beloved, John. I think I can show them where they may look for consolation, and find it. I think when John migrates here (if he has a chance) a little longer, that he will come here to stay. I think that his desire to return is one that is common to humanity, and one that, after a while, would be gotten over.

As evidence of this I will mention the Chinese immigration to Java, to Malacca, and to Burmah, which has been going on for a much longer time than the immigration to America. To these places John goes; in them he raises his family, dies, and is buried. This shows that there is no *necessity* about his returning to China, and that probably with a little study of the Chinese character, and a little tact, he could be induced to stay in this country. Allow me to suggest that this little tact does not consist in annoying him, insulting him, nor even in mobbing him. The good people of the coast seem to have assumed that as he is so opposite to us in most things, a decidedly opposite way of treating him would be most likely to give them the result they are so anxious for, viz.: that John should make his permanent home with them. But this is a mistake, surprising as it may seem, and I would recommend our friends to study the Chinese immigration to other countries to find out both how to get him and how to keep him.

CHICAGO, January 28, 1884.

"UNEARNED INCREMENT" AND SHRINKAGE.

TO THE EDITOR OF THE NATION:

SIR: On page 45 of the current volume of the *Nation*, you justly say:

"No discussion of our land problem will be complete which does not show how the shrinkage"—*i. e.*, the shrinkage in values—"as well as the increment, is to be dealt with."

It is due to the author of the phrase "unearned increment," or of its equivalent, "unearned increase"—the late Mr. John Stuart Mill—to say that he did not overlook this point. Section 4 of the "Programme" put forward in 1870 by the English Land Tenure Reform Association, of which Mr. Mill was President, proposes—

"To claim for the benefit of the state the interception by taxation of the future unearned increase of the rent of land (so far as the same can be ascertained), or a great part of that increase, which is continually taking place without any effort or outlay by the proprietors, merely through the growth of population and wealth; *reserving to owners the option of relinquishing their property to the state at the market value which it may have acquired at the time when this principle may be adopted by the Legislature.*"

In a paper explaining this "Programme"—*vide* pp. 225 *et seq.* of the fifth volume of 'Dissertations and Discussions,' published in 1875 by Henry Holt & Co.—Mr. Mill supplements the words which I have italicized by saying that owners who may not turn their lands over to the state when the proposed system of taxation shall be put in force, "should be allowed at any future period to alter their minds and give up their lands for the price first offered, or more, if they can show that they have made, during the intervening period, substantial improvements at their own cost." He adds: "The option thus allowed would be a permanent security to the land-owners against any unjust or excessive exercise of the right of taxation by the state." That it would guarantee the land-owner against the risk of loss through shrinkage, as an offset to depriving him of the chance of gain through unearned increase of value, is, of course, apparent.

It is, perhaps, hardly necessary to remark that the phrase "unearned increase of value" just used is substantially equivalent to the phrase "unearned increase of rent," since the selling value and the rental value alike depend on the amount of income that can be derived from the land. As the word rent is used by Mr. Mill in its scientific sense, "unearned increase in the rent of land" would, of course, include unearned increase of rental value where the land is occupied by the owner, as well as unearned increase of actual rent—in the popular sense of the word—in cases where the land is occupied by a tenant.

It may be worth while to note the fact that, whatever may have been the case with building land in the cities and towns of Great Britain and Ireland, a considerable part of the farming land of the kingdom has fallen in value since the time when the "Programme" above referred to was put forth; and that, under the operation of the plan then advocated by Mr. Mill, the state would probably have had a good deal of land thrown on its hands at more than its present market value. How far the losses to which, for a time at least, it would thus have been subjected would, during the same time, have been overbalanced by the revenues from unearned increase, I shall not attempt to estimate; but the net gain to the public treasury, and through it to the people, would doubtless have been considerably less than Mr. Mill anticipated.

The truth is, that it is in a new and rapidly-growing country, like the United States, that the plan advocated by Mr. Mill would produce its largest results. The depreciation of farming land in Great Britain—so far as such depreciation has actually taken place—was due in considerable part to the cheapening of transporta-

tion between the Atlantic ports of the United States and the grain fields of the Northwest, which increased the activity of American competition in British markets; but this is a cause from which the American land-owner gained in about the same degree as the British land-owner lost. A certain amount of unearned increase of value was simply transferred from British land to American land.

There are, of course, many instances of "shrinkage" of value, even in this country. This is especially the case in periods of great business depression, such as that which followed the panic of 1873; but even in times of prosperity, miscalculations are often made as to the destiny of particular tracts of land, and speculation carries prices to a pitch that cannot be maintained, making more or less shrinkage inevitable. In the main, however, the course of land values is rapidly upward, and is destined to be so for a long time to come, unless events as unlooked for as another glacial period, or as a collision with a comet, shall occur to prevent it.

But while it is in new countries, rapidly increasing in population and wealth, like the United States and some of the British colonies, that "unearned increase in the rent of land"—I use the word "rent" in its technical scientific sense—is most strikingly manifested, and is most rapidly enriching one part of the population at the expense of another part; and while it is in such countries that a system of taxation like that advocated by Mr. Mill would be most effective, it is precisely in such countries that there is the least inclination to adopt any measure of radical land reform, for their statesmen seem to be imbued with the conviction that it will be all in good time to lock the stable-door when the horse shall have been stolen.

EDWARD T. PETERS.

WASHINGTON, D. C., January 29, 1884.

GREEK OR BARBARIAN?

TO THE EDITOR OF THE NATION:

SIR: You have very properly remarked that students who do not succeed in Greek at our colleges are not likely to succeed any better in French or German. I think the remark an important one, and the only one that can be in fairness taken against the well-known argument of Mr. Charles Francis Adams, jr. There is, however, something more to be said on the subject, which, as far as I know, has not been alluded to by any of the numerous writers who have taken up the defence of Greek against the threatening inroads of the barbarians. If it be true that a poor scholar in Greek would very likely have been just as poor in French and German, it is true for the reason that a modern language *thoroughly studied* is about as difficult as an ancient one, and that, hence, as much or nearly as much time should be allowed for the study of the one as of the other. Dr. Peabody, in an article in the *Atlantic*, greatly errs in thinking it possible that a student who gives most of his time and attention to Latin and Greek may learn German and French in odd hours, by a purely conversational or similar method.

I have taught German and French for over twenty years to collegiate classes, and have been a devoted and fairly successful student of ancient and modern languages for well-nigh forty years, but during all this time I have never met a case like the one considered possible by Dr. Peabody. To learn German well requires fully as much time as to learn Latin well. It takes far less time to learn to *read* French, but to gain a fair mastery in writing and speaking French would require more time, in my opinion, than is devoted to Greek in our best colleges.

It will doubtless be said that it is not the object of the college to teach anything thoroughly—except the ancient languages! I have no quarrel with those who believe this, but I insist on their stating the fact. Four years are a brief time to obtain something more than a smattering of three or four languages. The testimony of the most competent judges—for instance, President Barnard, also the late Edward Lasker, and many presidents of German gymnasia—seems to have established the fact that even Latin and Greek are not well learned during the time now devoted to their study; and who has ever heard of any one really gaining more than a superficial knowledge of a modern language, in addition to his Latin and Greek, during that time? The knowledge of French possessed by a German Gymnasium graduate is more than modest, and not much better than the knowledge of a modern language possessed by our own graduates of the A.B. course. Would it not, under these circumstances, be wise to adopt two courses of study in our colleges, one emphasizing the modern, the other the ancient, languages? The State Universities of Michigan, Iowa, and others have done so, and Cornell at Ithaca also. I feel quite sure, from actual experience, that such an arrangement would prove satisfactory, because it would leave the classical side a chance to prove their superiority as educators of the "whole man," and enable the other side to give a thorough training in the modern branches. The Latin, all or most of it, might be retained in the latter course, as it actually is in the institutions named.

Those who think that the Berlin test, as applied to the Realschule students, was decisive, and who on this account oppose the plan here suggested, should bear in mind that the Prussian Realschule has to contend with a peculiar difficulty, viz.: that of not being considered the equal of the Gymnasium. If, indeed, this prejudice were well founded, it would not prove anything against the training in modern languages, but against an insufficient amount of such training. The Prussian Realschule requires 84 hours (the weekly average for the course) of languages, while the Gymnasium requires 126 hours. Of its 84 hours, the former gives one-half to Latin, and divides the other half between French and English. The remainder—42 hours—is devoted by the Realschule to additional mathematics (50 per cent. more than the Gymnasium allows) and to several sciences.* It follows that the Berlin test rather condemns the deficiency of language in general, or else the preponderance of mathematics and science, but not the training in modern languages, if made just as long and complete as the training in the ancient languages furnished by the Gymnasium.

One word in regard to the educational value of modern languages. Prof. Max F. Müller, of Oxford, claims that this value is fully equal to that of the ancient tongues, leaving literature out of consideration. Professor Whitney, of Yale, emphasizes the importance of the study of languages next of kin to the English, as a natural basis for comparative philology. Both gentlemen rank high as philologists, are sincere friends of classical culture, and speak from a vast experience. Doctor Peabody, to whom I have referred, claims superiority for the Greek as a training for literary purposes, and asserts that he can tell from the style of an article whether the writer has had Greek training or not. I have some doubts about this. The fact is, most writers of some standing necessarily have had a classical education, for the simple reason that most of them are graduates of colleges, which until recently have recognized no other. Nevertheless, we may find a few good writers who built their high culture on a different foundation, and gained their fine diction in another school. If there were a Shakspere among us, would Doctor Peabody miss the Greek stamp on his writings? Or would he think less of Dante, Schiller, Burns, because these great poets were innocent of Greek? Would he, as an editor, refuse contributions from a Herbert Spencer, a John Bright, a Professor Tyndall? Until proof is furnished that these men would have been still better writers if their early education had included Greek, Doctor Peabody must not expect us to attach very much value to his assertions.

C. A. EGGERT.

IOWA CITY, January 20, 1884.

*Some time ago I was corrected by one of your contributors for having claimed equality in the amount of Latin required by the Realschule and Gymnasium. The writer gave the requirements of the Saxon Realschule, which is lower than that of the Prussian. I was nevertheless in error in claiming equality; the real proportion is as above stated. (See Wiese, 'Das hoehere preussische Schulwesen.')

THE DECLINE OF LAISSEZ-FAIRE IN ENGLAND.

TO THE EDITOR OF THE NATION:

SIR: During the reading of the acute and interesting observations of Mr. Dicey in the *Nation* of January 10 and 17, upon the present tendency in England to make more and more use of the agency of the Government in effecting social reform, as contrasted with the strong laissez-faire notions of thirty years ago, it has occurred to me that a strong and interesting evidence of this alteration is presented by the change wrought since that time in English public opinion upon the history of England in the seventeenth century. This is shown not only in the case of the royalist party in general, but especially in the case of Wentworth. A revulsion of feeling has occurred in favor of the party, and especially of the statesman, who wished to gather power into the hands of the Government, to be used for the accomplishment of great internal reforms. It cannot be supposed that this is owing chiefly to Mr. Gardiner's researches, but rather that the change in the current of public opinion as to governmental action in the present has, to borrow a metaphor from electricity, induced a current in public opinion upon the action of Government in the past.

It seems to me, too, that the increase which Mr. Dicey notices, between 1850 and 1880, in the prominence given to sympathy in English social and political thought, is similarly reflected in the contrast between the characteristic nineteenth-century histories of the two periods—between Macaulay's narrowness of sympathy and the broad and impartial appreciativeness which, aside from its scholarship, is the distinctive merit of Mr. Gardiner's great work.

J. F. JAMESON.

BALTIMORE, January 27, 1884.

AN INDEX WANTED.

TO THE EDITOR OF THE NATION:

SIR: It is a matter of surprise and regret to students of English literature that no volume of the series of English Men of Letters has yet been indexed. Facts relating to one of a group of contemporary writers have to be traced through several volumes of the series. To find all that is said on Burke, one must read the volumes on Johnson, Goldsmith, and Gibbon. This work is easy and pleasant enough for awhile; but one's energy sometimes flags after searching for

a single fact through the 6,000 pages of the series. Every careful student will partially index his books for himself, but every such student would regard a complete index of this series as a valuable addition to his library.

W. E. MEAD.

ANSONIA, CONN., February 1, 1884.

DR. CLEVENGER AND THE UNIVERSITY OF CHICAGO.

TO THE EDITOR OF THE NATION:

SIR: Holding Professor Olson's communication before a mirror, or inverting it, neither adds to nor detracts from its lucidity. His well-known familiarity with the classics affords him a scope of expression often quite felicitous, and enables him upon occasion to be diplomatic—abilities the genial Professor, whom everybody likes, would value less were his acquisitions less classic and more scientific.

I felt pained to think he should have thought it necessary to imply so much in saying so little. It is of little consequence that the club held its meetings in the University, and that its proper title is University Club of Chicago and not Chicago University Club. For that matter, according to the Douglas heirs, there is no Chicago University or University of Chicago. They claim that the Senator deeded the land upon which the University was built, with the stipulation that the University should be called by his name.

The chair in question, according to the catalogues, was not vacant; but as Professor Dexter has not delivered a lecture at the University for some years, and as the suggestion of my appointment was made after that gentleman had brought suit against the University, it is safe to assume that the chair in reality was unfilled, except so far as Professor Bastin could spare time from teaching zoölogy, botany, chemistry, physics, mineralogy, and geology, to fill it.

Professor Olson was President of the University Club at the time the Darwinistic lecture in question was delivered, and, as he may remember, interested himself with Professors Bastin and Garrison in consulting the President of the University concerning my appointment; and that activity in that direction was suddenly ended immediately after the lecture was delivered, even though before this the President had made an appointment to call upon me concerning the chair. Another member of the Faculty told me that, as my evolutionary views clashed with those taught in other departments of the University, the President reconsidered the matter of appointing me. I understood that Professor Bastin resigned owing to similar intimations concerning the effects of his teachings. The well-known Baptist affiliations of the University are incompatible with evolution, but not with involution.

As to the martyrdom alluded to, probably the necessity for bringing suit to recover professorial salaries would make the incumbency of, and not the failure to obtain, the chair a sacrifice.

This ends *my* share in the controversy, no matter what may be published hereafter.—Respectfully, S. V. CLEVENGER.

CHICAGO, February 1, 1884.

THE THEORIES OF ORE DEPOSITS.

TO THE EDITOR OF THE NATION:

SIR: Permit me to endeavor to correct, as far as possible in the space allowed, some of the statements contained in the review of 'The Geology of Wisconsin,' in the *Nation* for January 24. I refer to the nearly two columns devoted to the ore deposits, in which it seems to me your critic has done injustice to a number of scientific men.

The view that the copper of the Lake Superior region was originally finely disseminated through the igneous rocks has been advocated by Müller (1856), Bauerman (1866), Marvine (1873), Wadsworth (1880), and others. That it was locally concentrated through the agency of permeating atmospheric waters has been held by Foster and Whitney (1850), Rottermund (1856), Müller (1856), J. W. Dawson (1857), Hunt (1863), Bauerman (1866), Pumpelly (1871), Marvine (1873), Wadsworth (1880), and others. That the copper was originally a portion of the material from which the lavas were formed has been advocated, if not by others, at least by Wadsworth, who, after summarizing the views of others, gave in 1880 a theory in all essential points identical with Chamberlin's.

It was held by Whitney, in 1854, that the lead and zinc deposits were from aqueous solutions, and that the gases originating from the decomposing organic matter in the beds influenced the precipitation. In 1860, after giving sufficient evidence to show that the ores were extracted from the ocean during the Trenton Period, Whitney stated his belief that the cause of that extraction was the decomposition of the immense amount of organic matter in the beds and the hydrogen sulphide yielded by them; and that the finely divided ores thus scattered through the formation were later concentrated by the percolating waters. Pumpelly and Hunt later advocated the same view, and added to it the theory that organic bodies, in the process of growth, stored up metals in their tissues, while later, through their decomposition, these metals were deposited in the forming strata. Pumpelly accounted for the localization by ocean currents and *sargasso seas*, and held that the metals were leached into the sea from older formations. Shaler, in 1877, summarized these views, and thus presented a theory almost identical with Chamberlin's.

I claim, then, that your critic is unjust to others in stating that all theories previous to Chamberlin's are unsatisfactory while his is satisfactory, when others had previously advanced the same views. Your critic is mistaken in his statement that Whitney regarded the Archæan rocks as the distant source of the metals; and in attributing to Chamberlin the original idea of the theory of ore deposits given in your columns. The mode of presentation and certain details of local application alone seem to be original with Chamberlin, and although he was not as careful as he should have been to give credit to others, the injustice done in the review seems to be the fault of your critic, whoever he may be, rather than of any one else.

I have written this not to endorse any theory, but simply to see justice done.—Yours very respectfully, M. E. WADSWORTH.

MUSEUM OF COMPARATIVE ZOÖLOGY,
CAMBRIDGE, MASS., February 4, 1884.

Notes.

G. P. PUTNAM'S SONS announce for their spring publications 'The History of the Discoveries of America to the Year 1525,' by Arthur James Weise; 'Prehistoric America,' by the Marquis de Nadaillac, translated by "N. D'Anvers," and furnished with a preface by Prof. F. W. Putnam; Anton Gindely's 'History of the Thirty Years' War,' translated by Prof. Andrew Ten Broeck; 'The Book of the Beginnings,' a familiar study of Genesis, by the Rev. R. Heber Newton; 'Bible Characters,' by the late Rev. Alexander D. Mercer, D.D., with a memoir; 'The Words of Christ, considered as Principles of Personal and Social Growth,' by President John Bascom, of the University of Wisconsin; 'By-Ways of Nature and Life,' by Clarence Deming; 'The Early Spanish Masters,' by Emily W. Washburn; 'The True Theory of the Sun,' by Thomas Bassnett; 'The Unity of Nature,' by the Duke of Argyll; 'Politics,' an introduction to the study of comparative constitutional law, by Wm. W. Crane and Bernard Moses; 'The Elements of Political Economy,' by Prof. Émile de Laveleye, translated by Alfred W. Pollard; a new edition of the 'World's Progress'; and a new (the "Stuyvesant") edition of Irving's Works, in seven volumes, large 12mo, at a cheap price.

Charles Scribner's Sons have in press, or in preparation, 'Peter the Great,' by Eugene Schuyler, of which the magazine-reading public have already had a foretaste, and which will be illustrated by a very large number of engravings and a special map of Europe in Peter's time; 'Creation; or, the Biblical Cosmogony in the Light of Modern Science,' by Prof. Arnold Guyot; 'The Creoles of Louisiana,' by Geo. W. Cable, illustrated; 'The Question of Ships,' by Lieut. J. D. J. Kelley, U. S. N.; and 'Dr. Johns' and 'Bound Together—A Sheaf of Papers,' in the uniform edition of the works of Donald G. Mitchell. The same house will be the American publishers of the 'Life of Frederick Denison Maurice,' by his son.

'Darwinism Stated by Darwin Himself' is the title of a volume of selections from the writings of the great naturalist, by Professor Nathan Sheppard, to be published by D. Appleton & Co. They will also add to their Parchment Paper Series 'Pictures of English Society,' by George Du Maurier, taken from *Punch*.

Following Part I. of the first volume of the Philological Society's great 'Dictionary of the English Language' (*A* to *Ant*), Macmillan & Co. will issue 'The Cup and the Falcon,' a new drama, by Lord Tennyson, and this poet's works in a new popular edition, in one volume.

F. W. Christern has received the prospectus of a great undertaking on the part of the Paris house of Victor Palmé. This is nothing less than a reproduction in facsimile of the 'Conciliorum Collectio' of Joannes Dominicus Mansi, which was published at Florence and Venice in the period 1759-1798, and is now practically unobtainable at any price, though it is the standard work of reference for the leading historians of the day. The reprint will be sold only by subscription, and only as a whole, embracing thirty-one volumes. These will appear at the rate of one every two months, and will be provided with a general index.

"Le Gendre de M. Poirier" of MM. Émile Augier and Jules Sandeau has been published out of turn in Mr. Wm. R. Jenkins's "Théâtre Contemporain," owing to the circumstance of this comedy's having been selected for a text-book at Columbia College.

It is not a little difficult to find anything new and true to say about Cavendish's 'Laws and Principles of Whist,' the fourteenth edition of which has just been published (London: De La Rue; New York: Scribner & Welford). He who gives his days and nights to the study of Cavendish will surely avoid that desolate old age which Talleyrand seemed to dread more than any punishment in the world to come. A word of praise is due to the care with which are printed in red and black the "hands" of the various illustrative games and *coups*.

The appearance of 'A Latter-Day Saint,' the first volume in the "American Novel Series" of Henry Holt & Co., seems to mark a distinct stage in the change and evolution of American publishing consequent on the starting of the cheap "libraries" and the break-up of the courtesies of the trade. The new series is sub-

stantially uniform with the admirable "Leisure Hour Series," perhaps the best collection of foreign fiction ever issued by any American publisher. Devoted at first wholly to reprints, it was a long while before an American novel was admitted into the "Leisure Hour Series," and the first intruder, 'Democracy,' did not have many followers nor any as successful. But as English fiction is driven almost entirely out of American magazines, so is it dropping out of the lists of the regular publishers, who cannot (or care not to) compete with the Pirates' Own Library. Running down a catalogue of the "Leisure Hour Series," we noticed that it has contained eighty-eight volumes by British authors, thirty-two by Germans, sixteen by Americans, ten by Frenchmen, seven by a Russian (Turgeneff), and one by a Scandinavian (Bjornson).

Mr. Geo. Cary Eggleston's summary review of "Our Twenty-one Presidents," in the February number of the *Magazine of American History*, deserved portrait illustrations somewhat more *recherché* than have been allowed it. Dr. Cyrus Thomas's brief paper on the "Houses of the Mound Builders" is a very clear and convincing presentation of the evidence justifying the belief that these houses were very perishable structures of reeds or timber and clay. Prof. Edward E. Salisbury begins a valuable genealogical account of the Griswold Family of Connecticut. In the current instalment of the well-edited original secret record of private daily intelligence for Sir Henry Clinton, some fresh and interesting testimony is adduced affecting the loyalty of Gen. Sullivan.

The *Platonist*, "an exponent of the Philosophic Truth," edited by Thomas M. Johnson, and published at Orange, N. J., has just entered upon its second volume, despite its ungainly form and the popular prejudice against Greek.

The "Portraits of American Fishes," twenty in number, recently issued by the *American Angler*, a journal doing efficient work in the cause of fish protection, are praiseworthy as giving a good idea of the outlines of our most common salt and fresh-water fishes. Beyond this we can say little in their favor, though great accuracy is claimed in the delineation of the exact number of the fin rays, and even the scales on the gill covers of subjects. The engraving and printing are so poor that the plates are unattractive, and the impression they make at first sight unfavorable.

Prang & Co. are early in the field of St. Valentine with a series of luxurious *billets doux et beaux*, silk-fringed and verse-tipped. The subjects of the illustrations are rather in traditional accord with the Old World than the New, and the love-making of two English sparrows, which is the theme of the most successful of them, is not apropos of our 14th of February. Another, with a girl gathering apple-blossoms, is too remote for anything but dreams; but love, flowers, and birds go together there.

We receive from Mr. J. A. S. Monks a charming etching—sheep in a rolling pasture, a work full of good qualities and promise of even better. It is simple and large in composition, with a fine sense of the picturesque in choice of subject, and firm and direct in execution.

Up to the present time three numbers of the Proceedings of the Society for Psychical Research in England have been published. An extensive collection of all literature in any way connected with the debatable phenomena designated by such terms as "mesmeric," "psychical," and "spiritualistic," is being made. The fullest reports yet rendered are on thought transference, and the phenomena they describe certainly seem most extraordinary. A girl of seventeen is placed outside a locked door with a member of the committee to observe her closely. Within are her two younger sisters and other members of the committee. The latter select at random a card from a pack, and show it to the younger girls, who keep their minds intently fixed on it, when the name of it is called out, quite often correctly, by the girl without—in one case correctly fourteen times consecutively, where the chances against being right were 4,782,969. In another series of experiments simple figures, not easy to describe in words, are chosen, and a gentleman called in from another room who fixes the given outline intently in his mind. He is then led into a chamber and stationed behind, and within a few feet of, but *not* touching, a "sensitive" young man. After a few minutes of intense concentration on the part of the former, the latter takes up a pencil and draws a rough sketch of the figure. Many of the originals and copies are given. All who have seen these experiments, we are told, are fully convinced.

Hachette & Co. publish a second edition of the 'Manuel de Philologie Classique,' by Solomon Reinach, one of the most brilliant and scholarly of that corps of archæologists trained by France in the school at Athens, and whose graduates have traversed the whole field of classical archæology with a scientific enthusiasm which no hardship or even the fear of death (which has occasionally occurred among them) has ever checked. This volume is encyclopedic in its comprehension of all that is necessary to elementary knowledge of philology and archæology; an indispensable handbook for the student of the latter. It treats not only of philology pure and simple, but bibliography, epigraphy, palæography, the history of ancient art, numismatics (with careful indication of the method of recognizing false coins), comparative grammar of the Sanskrit, Greek and Latin, political and literary history of antiquity, music, measure in poetry, and the antique customs as revealed by literature and art, with a résumé of mythology. It forms a closely printed volume of 414 pages, including thirty-four pages of index—a marvel of condensation.

—"W. B. B." writes us:

"Your correspondent 'J.' suggests an index to *Niles' Register*. I beg leave to say that *Niles' Register* is included in the list of periodicals indexed by Poole in his 'Index to Periodical Literature,' which can be seen at any of the public libraries in New York city."

True; but this is not the kind of indexing our correspondent had in mind. Poole's does not supply the place of any special index, though in default of any it is of course invaluable.

—The series of lectures which Dr. Brehm, the distinguished German naturalist and traveller, is delivering in this city, does not receive on the part of our daily press the attention which the position of Dr. Brehm, as well as the intrinsic merit of the lectures themselves, deserves, and which, we are glad to notice, they meet with at the hands of our German public. Dr. Brehm, to whose 'Thierleben' we have often had occasion to refer in these columns, is in his own country second in popularity to no contemporary scientific writer, and as a lecturer it would be difficult to find his superior anywhere. No one who heard his discourses on "A Journey in Siberia" and "The Fauna of the Primeval Forest," could fail to be impressed with his eloquent delivery, abounding in exquisite bits of word-painting, such as his description of the awaking of spring in the Khirgiz steppe; the crossing of the river Pishma, in Southwestern Siberia, on floating ice perforated by the natives and held together by stout rope; an epidemic among reindeer herds in the dreary country of the Ostiaks, or the aspect of the forest scenery of Abyssinia. Dr. Brehm will deliver three more lectures at Steinway Hall, on "The Fauna of the Tundra" and "The Pagan Ostiaks," "Character Sketches of the Ape Family," and "Colonists and Exiles in Siberia."

—Sir Lepel Griffin's rather priggish article on "Philistia," in the January *Fortnightly*, has been received with great good humor on this side of the Atlantic, which proves that Americans have made some advance toward a state of mental equipoise since the time of Mrs. Trollope. We say priggish, because a writer who begins with the expression of a grave doubt whether Christopher Columbus conferred a blessing or a curse upon the civilized portion of the human race by discovering America, must be set down as a literary prig, however meritorious may have been his services in other departments of activity. Very droll, too, is Sir Lepel's self-examination upon the question whether he is really justified in delivering the opinions which a two months' sojourn in the United States have enabled him to form. The fly on the ox's horn took an equally serious view of his responsibilities. Having settled this matter in favor of entire frankness, he sets forth with a long quotation from the New York *World*, in the style of Mr. Jefferson Brick, illustrating in a rough way, perhaps, but nevertheless truly, the ideas entertained by "the most amiable and intelligent Americans" in respect of their own grandiose future, and the humiliation in store for the bloated aristocracies of the Old World. That this is the real spirit of America is made all the more certain to him by his perusal of "one of the latest and most pleasing American books, entitled 'An American Four-in-hand in Britain,' by Mr. Andrew Carnegie." While Americans hold the most unfavorable views of the destiny of Europe generally, they entertain a perfectly brimstone feeling toward England. Their dislike of Englishmen is, however, easily accounted for, because, according to Sir Lepel, the English are "almost the most disagreeable race extant." With this fine touch of impartiality he goes on to show that it is one of the reigning fallacies of the day to suppose that American women are good-looking. They are, on the contrary, extremely plain and ill-favored, except when one approaches the Canadian line, where an intermixture with the fine blood of the north has brought in a streak of comeliness. This is especially noticeable at Detroit, which is famed among American cities for its beautiful women. Lord Coleridge's compliment to American women for their beauty and intelligence transcended, in Sir Lepel's opinion, the ordinary bounds of after-dinner gush. Indeed, the Chief Justice's opinions of America and Americans generally have had a depressing effect upon Sir Lepel, causing him to doubt the independence of the Judiciary. "A Chief Justice," he says, "should speak only from the bench." Sir Lepel attended one of Mr. Matthew Arnold's lectures, and went to the theatre to see how Mr. Irving and Miss Terry were appreciated by New York audiences. He found Mr. Arnold a total failure as a lecturer, because nobody could hear him, and nobody could have understood him if they had been able to hear. Mr. Irving made a mistake in producing the play of "Charles I." in New York, because the Americans, "although ignorant of history, still vaguely associate Cromwell with liberty and the Stuarts with persecution." Sir Lepel had been led to suppose that he should find the works of Matthew Arnold in the hands of the railway porters of America, so widely were the blessings of education extended throughout the country. But he did not see one railway porter thus employed. In fact, he did not see one whose literary diversions took any higher form than the *Police Gazette*. This is far from reassuring, because it

proves that Mr. Arnold's present endeavor to diffuse sweetness and light among fifty millions of people is a much heavier task than was generally supposed. Sir Lepel promises us another article on the working of our political institutions. It is safe to say that he will not be taken too seriously.

—Some twenty-five years ago Henrik Ibsen began publishing the remarkable series of works (now numbering thirteen dramas and a volume of lyrical poems) which has gained for him the position of the foremost Scandinavian poet, and has called forth from his great but generous rival, Björnson, the admission that he possesses the "greatest dramatic power of the age." No Scandinavian poet is so widely read, owing not only to the burning earnestness and not infrequently biting satire of his writings, but partly, also, to the fact that, by adopting a peculiar orthography, his works are read with almost equal facility in Denmark, Norway, and Sweden. Each new work of Ibsen's has been received with harsh comments by the critical press of Scandinavia; but of late years, when the high praise of foreign critics has compelled his home assailants to at least tacitly admit the unqualified excellence of his literary style, criticism has been directed to the subject-matter of his works, and his last two dramas, "Et Dukkehjem" ("A Doll Home," of which a translation by Miss Lord, entitled "Nora," was published in London in 1882) and "Gengangere" ("Ghosts"), in which he sharply satirizes the relations of sex in married life, have given rise, in addition to the usual press notices, to a whirlwind of pamphlets, pro and con. The eminent Danish critic, Georg Brandes, has closely followed Ibsen's literary career for nearly twenty years, and during that time has not spared criticism, though the harsh tone of some of his earlier notices has latterly been softened. To the November number of *Nord und Süd* he has contributed a thorough and appreciative paper, containing a masterly analysis of the poet's life and works. He points out how the hard daily struggle of Ibsen's youth must have acted on his reserved, satirical nature as a challenge, and resulted in a certain suspiciousness in his dealings with mankind. The ground tone in Ibsen's works is one of deep dejection. A born idealist, who from the first thirsted after the beautiful in its highest form—ideal, spiritual beauty; a born rigorist, influenced also by his orthodox surroundings—determined to admire or acknowledge no other than moral beauty—he needed but a few repulses to cause him to draw back within himself with a distrust of the surrounding world in his heart. His first deep impression as a spiritual individuality was that of the rareness, or "never-ness"—as he in a bitter moment has added—of moral worth. It became an impulse with him to put to the proof whatever seemed real, and convince himself of its falsity. It became a passion with him to knock with his fingers upon what seemed like metal, and it afforded him a sort of painful satisfaction to hear the clang of its hollowness. Ibsen is a pessimist, but his pessimism is not of the kind which finds life itself an evil. He finds the world bad, but does not concern himself with the question as to whether life is a good. However sceptical he generally is, he does not really doubt the possibility of happiness. His pessimism is of a moral nature, grounded in the conviction that the ideal may become the real. It is, in brief, the pessimism of indignation; and his want of sympathy with much that is painful is due to his conviction of the educational power of suffering.

—Brandes emphasizes the fact that Ibsen's works represent with peculiar exactness his actual beliefs, and quotes statements made by Ibsen in conversation, and extracts from his letters, as proofs. For example, in December, 1870, Ibsen wrote: "Liberty, equality, fraternity are no longer the same things that they were in the days of the blessed guillotine. This is what the politicians will not understand, and therefore I hate them. These men want only revolutions in the outer, in the political world. But all such are mere trifles; it is a revolution in men's spirits that is needed." "The strife for freedom," Ibsen writes, in 1871, "is nothing else than the constant, living appropriation of the idea of freedom. He who possesses freedom otherwise than as the thing struggled for, possesses it dead and spiritless." Ibsen knows himself only as an individual, and the only thing he really believes in and respects is personality. He stretches his belief in the sacredness of personality to the furthest. He thinks that an individual in order to develop the fruitful possibility within his being, first and foremost must stand free, stand alone; and he has therefore a wakeful eye to the dangers which association, friendship, and even marriage, in this regard, carry with them. Ibsen is convinced that in each man slumbers a warrior soul, an unconquerable might. Man shall become himself not through the will of higher powers, but through his own. In the third part of his article Brandes has carried his psychological analysis so far, as he puts it, "that the standpoint of Ibsen's mind can be seen in the light of the literary consciousness of the time." It is impossible to follow Brandes in this interesting part of his article and do justice (in a few words) to his keen analysis of the different groups of Ibsen's plays, as they deal with one or other of these four divisions of the ideas which Brandes thinks are especially active in the present—namely, such as deal with religion; such as have to do with the differences between two ages; such as relate to classes of society and their struggles; lastly, such as deal with the relations between sex. Naturally, Brandes, in closing, makes some remarks comparing Ibsen and his contemporary, Björnson. Ibsen, he claims, is a universal spirit, while Björnson, despite the cosmopolitanism of his poetical description, is national. The two have no other likeness than that which arises from having the same country, the same lifetime, and similarity in the use and development of poetic material. The article is accompanied by an etched portrait of Ibsen, which displays a face of noble and impressive appearance, but of almost repelling sternness, though this is somewhat modified by Brandes's word picture of the poet.

— It was recently announced in the German papers that all doubt concerning the authenticity of the much-discussed memoirs of Heine in M. Julia's possession would soon be set at rest by their publication in *Vom Fels zum Meer*. Instead of solving this question, however, the February number of that periodical contributes its share toward the complication by an article from Herr Gustav Karpeles, who, if anybody, ought to be able to speak with positiveness, but who, instead, is exasperatingly cautious and judicial. That there once existed at least three manuscript volumes of Heine's memoirs he considers as established beyond doubt; but whether, as would appear from the poet's utterances at various times, they were begun as early as 1823, partly recast later, in deference to his relatives, or consigned by him to the flames in a fit of dissatisfaction, and entirely rewritten in the last years of his life, when he lay in the "mattress tomb"—all these questions Herr Karpeles declares himself unable to answer. That Heine in his last illness was occupied with what he spoke of as his memoirs we know from his letters to the *Mouche* and from Alfred Meissner, who himself saw the manuscript; but Karl Hillebrand, then Heine's secretary, seems to have been unaware of their existence, or at least is silent on the subject. On the whole, Herr Karpeles thinks it "probable" that whatever unpublished manuscripts Mathilde Heine sold to the poet's relatives had previously been copied, and that such a copy is at present in the hands of M. Julia. Neither Herr Karpeles nor any of the numerous writers who for many months have been busy with the memoirs has done more than whet public curiosity concerning a work which Heine himself, in a letter to his publisher, Campe, spoke of as "a great book, covering the entire history of our time, . . . with its most remarkable persons, . . . the result of my most precious and most painful studies," and in which, as Herr Karpeles temptingly points out, we should find depicted Goethe and Schlegel, Humboldt and Hegel, Meyerbeer and Mendelssohn, Rossini and Wagner, Lassalle and Marx, Thiers and Victor Hugo, George Sand and Musset.

— In every other respect the latest number of *Vom Fels zum Meer* will not disappoint its readers, who, if they do not receive the solid instruction which, for instance, the *Rundschau* offers, are better served in point of variety than those of any other monthly known to us, either in Germany or in this country. None contains so miscellaneous a "miscellany," and but few surpass it in illustrations. In looking over the list of writers in this number we meet with but one widely-known name, that of Anzengruber, the inimitable writer of peasant dramas; but the English reader who knows that great names in periodicals are not always a guarantee against disappointment will be inclined to admit that the economical habits of German publishers have their advantages, if not for writers at least for readers. We believe the practice of offering large sums for a mere name, regardless of the nature and quality of the contribution, is unknown among publishers of German periodicals, and hence none of the articles which appear in the best monthlies ever have the appearance of having been expressly "written up." Indeed, the *Rundschau*, to the obvious advantage of all concerned, not infrequently publishes articles which, strictly speaking, are not new, such as recently delivered scientific addresses. We observe that *Vom Fels zum Meer* in its latest number incidentally returns to a subject which, some months ago, it exhaustively discussed in an able article on "White Lies" (*Die Nothlüge*), and which has been still more fully treated in a recent work by Max Nordau on "The Conventional Lies of Civilized Man" (*Die Conventionellen Lügen der Culturmenschheit*). Can it be that another era of German introspective philosophy is dawning? And has the ingenuousness of Bismarck really paved the way for another "Tugendbund"—for a return to the days of Fichte, the most uncompromising theoretical opponent of "white lies" among German moralists?

—The high-level meteorological observatory on the summit of the Ben Nevis, formally inaugurated in October last, was visited at Christmas-time by two members of the Governing Body of the institution, Professor G. Chrystal and Mr. John Murray, and a few particulars of the visit of inspection are given by Professor Chrystal in *Nature*. The routine of the observatory at present consists in hourly observations of the barometer, protected thermometers, dry and wet-bulb and maximum and minimum; wind-direction and pressure; rain, snow, sleet, or hail; mist, fog, or haze; clouds lower and upper; amount, species, and direction; sunshine-recorder, miscellaneous, thunder, lightning, ha-

los, aurora, meteors, etc. The thermometric instruments are attached to a ladder fixed in the snow, as the level of which rises and falls, they are moved from step to step, so as to keep them as nearly as possible at the regulation distance of four feet from the surface. A measurement from the top of the ladder to the surface gives the depth of the snow, which then varied from six to ten feet at different parts of the summit of the mountain. The observers have had for some time back to conduct a constant warfare with the rapidly accumulating snow. Not infrequently all hands had to be turned out to clear the doors and windows of the observatory, when it sometimes happened that the snow drifted in so rapidly that it was almost impossible to shut the door again. The device of the snow staircase overcomes the difficulty to a large extent. Professor Chrystal does not dwell at length on all the interesting casual observations recorded in the log kept by Mr. Omond, the chief observer. He alludes, however, to the frequently occurring phenomenon which Mr. Omond calls "glories." The shadow of the head or hands of the observer is frequently seen on the clouds in the valley to the northeast surrounded by a halo of color. The phenomenon appears to be akin to, or identical with, the mist phantom so well known under the name of the "Brocken Spectre." The directors passed one night on the summit with the observers, and rose the next morning to see the sun rise—an extraordinary spectacle. Mr. Omond was congratulated on the weather he enjoyed on Ben Nevis, but it appeared that the treat was as great for him as for his guests. Since the beginning of his seclusion on November 11, there had been only three fine days: all the rest of the time the most he had seen was an occasional glimpse of a snow-covered mountain-peak through a hole in the mist.

KADESH-BARNEA.

Kadesh-barnea: its Importance and Probable Site, with the Story of a Hunt for it; including Studies of the Route of the Exodus and the Southern Boundary of the Holy Land. By H. Clay Trumbull, D.D., Editor of the *Sunday School Times*. Charles Scribner's Sons. 1884.

WHETHER one shares the opinion of the author or not, that "Kadesh-barnea was a site of importance forty centuries ago"—an allusion to the march of Chedorlaomer; that "it was more than once the scene of events on which, for the time, the history of the world was pivoting"; that a study of it in its varied associations involves a study of Jewish history from the days of Abraham "to the still vague and shadowy days of unfulfilled prophecy"—it is not difficult to agree with him that that famous locality, the pivotal point of the Jewish wanderings through the wilderness, as related in the Pentateuch, is not too small a subject for a large book, considering that its location has been for centuries, and to this day continues to be, a matter of almost passionately earnest discussion among eminent scholars.

Where was Kadesh-barnea, or Kadesh (the Holy, or the Sanctuary), also designated as Enmishpat ("Fountain of Judgment"), Meribah (Strife), and perhaps also Rithmah (Broomgrass-spot)—around which the Israelites dwelled or wandered for thirty-seven or thirty-eight years; where Moses struck the rock and Miriam died; whence the Hebrews, on the return of the spies, started in their rash attempt to invade the Land of Promise from the south, and whence their leader sent messengers to the King of Edom, before moving toward the land east of the Jordan? What is certain is, that it was south of the southern border of Palestine; that it adjoined the western extremity of Edom; that it lay in a wilderness of its own name, forming a part of the Wilderness of Zin, in the still more comprehensive Wilderness of Paran. But, how far south did Palestine extend? how far west, Edom? and how far north, Paran? Which known site would answer all the requirements of the numerous texts in which Kadesh-barnea is mentioned? We must restrict our review of identifications to those suggested by actual travellers.

Dr. Thomas Shaw, an English scholar, who travelled in the East in 1722, was inclined to locate Kadesh as far south as Kalaat Nakhl, in the centre of the Pilgrim's way leading from the north end of the Gulf of Suez to the north end of the Gulf of Akabah, about 100 miles north of Mt. Sinai. The learned Pococke, who began his Eastern journey some fifteen years later, was induced by vague reports to presume that Moses's rock of Meribah, in the Wilderness of Zin, was even much nearer to the Mount of the Law. Nearly seventy years passed before another European scholar trod the ground of the Hebrew wanderings. In 1807 Seetzen, the famous German explorer, came on a "flat, dry wady," on the northwest edge of the Azazimeh mountain tract, which was designated to him as Wady el-Kdeis. Seetzen attempted no identification of the place with Kadesh, in spite of the resemblance of the names and of the proximity of the locality, about fifty miles south of the site of Beer-sheba, to the border of Palestine. The Swiss traveller, Burckhardt, who, following Seetzen, explored the Arabah, the great depression—a continuation of the Jordanic Ghor—extending from near the Dead Sea to the Gulf of Akabah, and in 1812 discovered the ruins of the ancient rock-city, Petra, thought Kadesh-barnea, in its wider sense, was perhaps the Biblical name of that gorge. Léon de Laborde, who artistically supplemented Burckhardt's description of Petra, accepted the Swiss traveller's suggestion, and located the fountain of Kadesh near Jebel Jerafeh, west of Petra. Karl von Raumer located Kadesh in the northern portion of the Arabah, and not far from that tract it was sought by the American traveller, Stephens, in 1836, and immediately after by Lord Lindsay and G. H. von Schubert. Dr. Robinson, whose explorations of Scriptural lands so rapidly eclipsed those of almost all other travellers through the same regions, believed he discovered the waters of Meribah-Kadesh in "'Ain el-Weibeh, one of the most important watering places in all the great valley" of the Arabah, near its north end. "There are here, indeed, three fountains, issuing from the chalky rock of which the slope is composed. . . . The southernmost source consists of three small rills of limpid and good water, flowing out at the bottom of a small excavation in the rock. The soft chalky stone has crumbled away. . . ." There was nothing striking in the topographical reasons which could be adduced in favor of all these identifications, and, on the other hand, there are many points in the respective Biblical accounts which militate against them—and they are very forcibly urged by our author.

About a year after the appearance, in 1841, of Robinson's 'Biblical Researches,' John Rowlands, an English clergyman, who had repeatedly travelled through the Sinaitic Peninsula and the adjoining parts, made a trip from Hebron southward, in company with his friend Canon Williams, and under the guidance of a Bedouin sheikh, Selim. The travellers had reached, on the wall-rampart of the Smooth Mountain, about fifty miles south of Hebron, a point, as they considered on natural as well as Biblical grounds, of the south frontier of Canaan. While they stood there, Sheikh Selim told them that at some distance beyond there was a place known as Kadis. It was exactly where they would have expected to find the site of Kadesh, but they were then unable to proceed to the place. Not long afterward Rowlands made another trip south—this time in company with Mr. Johns, the British Vice-Consul at Jerusalem—travelling by way of Gaza. Here he found two sheikhs of the Terabin Arabs—a tribe accustomed to roam through the eastern branches of the Wady el-Arish—who, after much inquiry, promised to guide him to Ayn Kadeis, in the Azazimeh Mountains. The journey thither was fruitful in identifications calculated to strengthen the expectation of reaching the site of Kadesh. And finally he stood, as he afterward described it in a letter to Canon Williams, "before the rock smitten by Moses, and gazed upon the lovely stream which still issues forth at the base of this rock." His excitement was indescribable as he

"paced backward and forward, examining the rock and the source of the stream; looking at the pretty little cascades which it forms as it descends into the channel of a rain torrent beneath. . . . The rock is a large single mass, or a small hill, of solid rock, a spur of the mountain to the north of it rising immediately above it. It is the only visible naked rock in the whole district. The stream, when it reaches the channel, turns westward, and, after running about three or four hundred yards, loses itself in the sand."

Rowlands had "not seen such a lovely sight anywhere else in the whole desert—such a copious and lovely stream." Everything seemed to answer perfectly to the description inferable from Scripture—the name, the location, the approaches, the roads, the wild surroundings, the rock, the water, and "the grand space for encampment which lies to the southwest of it—a large rectangular plain about nine by five or ten by six miles, and this opening to the west into the still more extensive plain of Paran."

The first scholar of eminence who supported Rowlands's view was Professor Tuch, of Leipzig, in 1847. Winer, in his Biblical 'Realwörterbuch,' and Dr. Wilson, in 'The Lands of the Bible,' also adopted it. In 1849, however, Dr. Robinson came out in defence of his own identification of Kadesh, ridiculing the discovery of Ain Kadis and "the amusingly credulous character of the whole narrative" about it. In America and England, Robinson's *dictum* was sufficient to prejudice most Bible students against Rowlands and his discovery; but in Germany, such high authorities as Fries and Kurtz came forward with able dissertations in opposition to the views of the American traveller, and a host of other critics accepted or favored their conclusions—among them Karl Ritter and Knobel. In England, too, the same view, favorable to Rowlands's Ain Kadis, was eventually taken by Wilton, Palmer, Tristram, and others, and in this country by President Bartlett and Professor Lowrie. What prevented Rowlands's striking identification from being universally adopted, in preference to the rather arbitrary locations of Kadesh in the Arabah, was mainly the doubt expressed by Robinson and his supporters, which was strengthened by the repeated failure of travellers to find the locality described by the enthusiastic English divine. Dr. Stewart, Dr. Thomson, Abeken, Palmer, Bartlett, and others came near Seetzen's Wady el-Kdeis and Rowlands's Ain Kadis, but each of them was led away from, or otherwise missed, the rock and the stream the sight of which so enchanted the latter explorer. The reason of these failures is thus stated by our author:

"All by themselves, in the mountains bearing

their name, north of the region of the Teeyâhah and the Haywât, are the Azâzimeh Bed'ween, 'one of the poorest and most degraded of Arab tribes'—the most Ishmaelitish of Ishmaelites. According to Palmer's testimony, 'they are superstitious, violent, and jealous of intrusion upon their domain, suspecting all strangers of sinister designs upon their lives and property.' . . .

"'Ayn Qadees, the site of Kadesh-barnea, is in the heart of the Azâzimeh territory. The Azâzimeh themselves will not guide travellers to it; nor will they give consent to the Teeyâha to do so. Hence, although it is but a little distance east of the direct route from Sinai to Hebron, it has, for generations, been practically inaccessible to travellers. The ordinary Teeyâha guides could not escort travellers thither; the superstitious Azâzimeh would not. And, in this state of things, the Teeyâha have doubtless been reluctant to admit to travellers that they knew of a place so near their route, while they were unable to go to it. Therefore it is that there came to be doubts of its very existence. . . .

"Rowlands, indeed, was peculiarly favored in having Terâbeen guides from Gaza, as he went in search of the long-sought site. The Terâbeen are the only Arabs who seem on good terms with all the other tribes alike. Their immediate territory stretches from below Suez to Gaza. They . . . are on excellent terms with the jealous, superstitious, and quarrelsome Azâzimeh. . . . It was through their guidance that Rowlands was enabled to reach the jealously-guarded fountain of Kadees within the territory of the Azâzimeh. But when he came out from that sacred enclosure, it seemed as if its entrance were not only immediately closed behind him, but actually lost to sight and knowledge."

It would take more space than we have to tell, after our author, by what use of wit and Yankee shrewdness, with what help from a noted dragoman, and in spite of what dangers, he, in the beginning of the spring of 1881, "on a casual tour, was enabled to overcome all these obstacles, and find his way to a sight shielded so jealously, and lied about so vigorously and variously, by successive generations of the typical Ishmaelites who surrounded it." For the particulars we must refer the reader to the part of the book which treats of the "Hunt." Mr. Trumbull entered the tract of the Azâzimeh through Wady Kadis, "an extensive, hill-encircled, irregular-surfaced plain, several miles wide, and . . . certainly large enough to have furnished a camping ground for Kedorla'omer's army, or for all the host of Israel"—which means a great deal in the sense of the writer, whose faith in the verbal text of the Pentateuch (of course including its often assailed figures) is such as to make him exclaim with St. Paul, in regard to doubt and doubters: "'God forbid: yea let God be found true, but every man a liar.'" Along the middle of the wady is an extensive water bed. Rich fields of wheat and barley covered a large portion of it. There were artificial ridges to retain and utilize the rainfall. Along the foot-hills of the ranges northward were found "cairns and circles of stone, which could hardly be other than remains of dwellings of a prehistoric age," and "signs on every hand of a large population there in former times." Our traveller then traversed a rough, stone-covered plain, still called Wady Kadis. It was distressingly waterless, with dazzling chalk hills in front—just such as the Wilderness of Kadesh must have been when the Israelites expected to die there with their cattle from thirst. But after nearly three hours of moving in the wady, on a sudden, sharp turn to the right, the eagerly-sought wells of Kadis were before his eyes.

"It was a marvellous sight! Out from the barren and desolate stretch of the burning desert-waste, we had come with magical suddenness into an oasis of verdure and beauty, unlooked for and hardly conceivable in such a region. A carpet of grass covered the ground. Fig trees, laden with fruit nearly ripe enough for eating, were along the shelter of the southern hillside. Shrubs and flowers showed themselves in variety and profusion. Running water gurgled under the waving grass. We had seen nothing like it since leaving Wady Fayrân. . . .

"Standing out from the earth-covered limestone hills at the northeastern sweep of this picturesque recess, was to be seen the 'large single mass, or a small hill, of solid rock,' which Rowlands looked at as the cliff (*Sel'a*) smitten by Moses. . . .

"A circular well, stoned up from the bottom with time-worn limestone blocks, was the first receptacle of the water. . . . A basin or pool of water larger than either of the wells, but not stoned up like them, was seemingly the principal watering place. It was a short distance southwesterly from the second well, and it looked as if it and the two wells might be supplied from the same subterranean source—the springs under the rock. . . . Another and yet larger pool, lower down the slope, was supplied with water by a stream which rippled and cascaded along its narrow bed from the upper pool; and yet beyond this, westward, the water gurgled away under the grass, as we had met it when we came in, and finally lost itself in the parching wady from which this oasis opened. The water itself was remarkably pure and sweet, unequalled by any we had found after leaving the Nile. . . .

"One thing was sure: all that Rowlands had said of this oasis was abundantly justified by the facts. . . . The sneers which other travellers had indulged in, over the creation of his heated fancies, were the result of their own lack of knowledge—and charity. . . ."

Is the problem now solved? Is it now as certain where Kadesh-barnea was as it is, say, where Duluth is? In answer to this question, we cannot go any further than to say that, agreeing, on examination, with Tuch, Fries, Kurtz, Knobel, and other authorities down to Mühlau and Volck in their just issued ninth edition of Gesenius's Dictionary, we deem Rowlands's identification of Kadesh, which Mr. Trumbull so weightily supports by his testimony and research, the strongest of all identifications known to us, and that the latter is quite modest when in the preface he expresses his "confident expectation that more good will come from the new discussions which this volume provokes than from the immediate conclusions of its own discussion of the main points at issue." Confirmations by new explorers, to whom the route has now been clearly pointed out, may soon dispel all objections based on the suspicion of "heated fancies," and secure to the American traveller lasting fame as one of the discoverers with Seetzen and Rowlands, or the rediscoverer, of the most interesting spot, next to Sinai, in the hoary traditions of the Hebrew migration from Egypt. Mr. Trumbull, who sees in those traditions not merely venerable legends but authentic sacred history, and believes, in spite of tremendous difficulties, in the unity and harmony of the "Mosaic" accounts, has devoted years of untiring research to the elucidation of all doubtful points connected with his main topic, ransacking libraries and piling up a prodigious amount of learned testimony, useful to scholars, though a portion of it be rubbish.

References to Bible texts, commentators, critics, and other authorities—some of them often repeated, and others quite superfluous—have, with the addition of copious indexes, swelled the volume to large proportions, but diminished its attractiveness for the common reader. On page 151 we find in the text, in support of a conjecture which supports itself, twenty-six "critical commentators and other Bible students" cited "for example"—the first seven being Adrichomius, Raleigh, Fürer, Quaresmius, Ainsworth, Drusius, and Pool!—and, in foot-notes, twenty-six references to books. The reference to Rabbi Solomon ben Isaac ("Rashi"), on the same page, shows that Mr. Trumbull has not always adhered to his determination "to cite directly from the authority quoted"; for Rashi does not express, at the place cited, the view adopted by the twenty-six, though his remark there well accords with it. Nor does Rashi, as referred to on page 189, say the words quoted—which express his meaning, however. Part of the contents of the first note on page 167 is not taken directly from the sources indicated, but from Neubauer's 'Géographie du Talmud' (p. 11), as appears from the spellings "*Ek*eb," "Yal*k*oot," "Si*ph*ré" and "Tosi*f*tha," and "*Sch*ebiith"—after Neubauer, and against Mr. Trumbull's strict rules of transliteration—who would write '*Eqeb*, for instance—and from the erroneous extension of the term Babylonian Talmud to the Yalkut, caused by a misapprehension of the headings in the corresponding table of the 'Géographie.' The reference to "Thevenot's *Reisen*" (p. 203) is evidently borrowed from a German book, which translated the Frenchman's title, 'Voyages.' Reland is erroneously introduced (p. 201) as a geographer "of Germany." The few other slips which we hit upon in reading this interesting volume are more or less pardonable misprints. The worst of these, because again and again repeated, is "Hor hagid*ad*" for Hor-hagidgad. The map attached to the book is very handsomely executed.

Addison. By W. J. Courthope. Harper & Bros. 1884.

ADDISON lies under more obligations to happy fortune than any other literary Englishman of high rank. Halifax saved him from the Church and the probable oblivion of a seat on the bench of bishops, and sent him to cultivate his genius by foreign travel. When, on his return, he seemed sinking into poverty, the same warm patron introduced him to Godolphin's notice and procured for him the inspiration of "The Campaign" in the shape of a promise of office. Throughout life, as thus in its opening, friends, admirers, employments, themes, and applause were found for him; and if in his death he had not the crowning favor of a good biographer, the defect was more than made up in later years by the luck of having Macaulay for his eulogist. It is not so long since those eloquent pages of the great essay declaimed of Addison's elevation and purity, his genius, his inestimable influence on English morals, and his superiority to Steele—"poor Dick," as Addison called him, well knowing his heart to be the warmest and most forgiving that beat with fidelity to his own. At the time, Macaulay's rhetoric, force, and fame bore down the feeble protests that strove here and there against the injustice and untruthfulness of the funeral oration he had pronounced over his predecessor in the Great-Mogulship of the middle classes. He had not, however, erased the name of "Atticus"—ah, if Addison had only escaped Pope's satire as nobly as Swift's jests! "Atticus" is a perpetual interrogation mark affixed to Addison's repute; it cannot be passed by, it tempts curiosity, it leads on to investigation, and the inquiry issues at last in a book like Mr. Courthope's.

With all his sincere regard for his hero, and his regrets that there is nothing new to say, Mr. Courthope is a very candid biographer and frank critic. He strews the confessions of Addison's limitations along his pages instead of massing them, but they are all mentioned and defined. The early works, the translations, the "Account of the English Poets," the Latin verses, etc., are tenderly handled; the dust is hardly brushed off them. The opera, "Rosamond," is dismissed with the quotation from Dr. Burney that nothing more need be said of Addison's musical talent than that he was insensible to Handel and had a predilection for Clayton. The tragedy, "Cato," is bowed out on its merits, as owing its success solely to long-extinct party passions—a play in

which "all the actors seem to be oppressed with an uneasy consciousness that they have a character to sustain, and are not confident of coming up to what is expected of them." The comedy, "The Drummer," is declared "a standing proof of Addison's deficiency in dramatic genius." Even as a poet, though a rally is made in favor of "The Campaign," Addison is suspected by Mr. Courthope of an "uneasy consciousness that he was really inferior to such men as John Philips and Tickell."

There is nothing left for Addison (of course he made no mark in Parliament or in his administrative offices) but to be found preëminent as an essayist; and yet Mr. Courthope, while acknowledging this necessity, can do plain justice to Steele:

"There is scarcely a department of essay-writing developed in the *Spectator* which does not trace its origin to Steele. It is Steele who first ventures to raise his voice against the prevailing dramatic taste of the age on behalf of the superior morality and art of Shakespeare's plays. . . . Steele, too, it was who attacked, with all the vigor of which he was capable, the fashionable vice of gambling. . . . The practice of duelling, also, which had hitherto passed unreproved, was censured by Steele. . . . The sketches of character studied from life, and the letters from fictitious correspondents, . . . appear roughly, but yet distinctly, drafted in the *Tatler*. Even the papers of literary criticism, afterward so fully elaborated by Addison, are anticipated by his friend, who may fairly claim the honor to have been the first to speak with adequate respect of the genius of Milton. In a word, whatever was perfected by Addison was begun by Steele."

After Macaulay's studied depreciation of the originator and manager of the periodical that determined the principal literary form of the eighteenth-century essayists, this is a very refreshing passage, nor does it overstate Addison's debt to the fag who idolized him from school-days. It is true that Addison was master of a literary manner usually finer than Steele's, though he had less heart, less earnestness, less tenderness, less sympathetic humanity and practical philanthropy. But the obligation to Steele should not be understood to imply too much. Undoubtedly Addison was far more effective in creating modern social public opinion by teaching wit to be decent and virtue to be amiable; by finding the true English mean between the Court and the Puritans; by making good taste, good sense, and good manners the characteristic ideal of the commercial and professional middle class. When all is said, that is the service he was really most instrumental in accomplishing; but it is by its nature a passing one. Sir Walter Scott did a very similar thing when he displaced the novels of the last age by his own; but the value of this revolution is felt only by the historical student. For posterity, Sir Walter's fame, like Addison's, rests on the actual worth of his work to the new age as it comes and goes. In Addison's case, while it is acknowledged that men ought not to cease to be mindful of the humble beginnings by which they rise, nor forget to be grateful to the pioneers of innocent literary amusement and cultivated criticism, nevertheless it cannot be blinked that the larger part of Addison's work is at present essentially commonplace. A new Dr. Johnson might hesitate to advise our youth to give their days and nights to Addison; in fact, our youth do not read, nor perhaps do they need to read, any of his sketches except the "Roger de Coverley" papers and the "Tory Foxhunter." The rest may be left, some to those who are still interested in sedan chairs and link-boys, some to those who are curious about Boileau's standard and the proprieties, some to those who do not yawn over homilies on cheerfulness, etc., etc.

Some shadow of the modern tedium induced by the standard essayists has fallen even on Mr. Courthope, who has hardly taken decent pains to clothe the dry bones of facts and criticism with a garment of the life they once sustained. The biography is, in fact, dull. So it would seem that, despite his keen, cold observation, second only to Swift's among contemporaries, despite his refined taste, his merciful humor, his adroitness and charm of style, his reconciling and humanizing influence over his age, Addison (not to speak it profanely), odorous of all his virtues, mounts *ad astra*—to the upper shelves. There he finds all his little senate "gone before," and with them can take his ease in his inn. A highly honorable, highly respectable, highly comfortable place he has, as in his earthly days at Button's. To posterity, as even to those friends who sunned themselves in his presence when his frigidity was thawed by wine, he seems a distant, chilly, isolated man, a spectator standing outside and observing the surfaces of life in the crowd; slightly grandiose, perhaps, but irreproachable in all forms, whether of courtesy or composition; the most affable if not the most accessible of friends; the favorite of fortune, and sometimes her dupe (as in the noisy Cato business); in his heart more stoic than Christian, with that pride in his dignity which tempted him to summon a rakish youth to his bedside to see how he "could die." What a pity it is that one cannot remember so fine a figure without recollecting also that there was the crooked papist who wrote "Atticus," and the honest Dick whose life, he humbly said, was "at best but pardonable." Such is the portrait, at least as Mr. Courthope brings out its lines, and it is the same picture painted by contemporaries.

Maria Edgeworth. By Helen Zimmern. [Famous Women Series.] Boston: Roberts Brothers.

MRS. OLIVER'S recent 'Life of Maria Edgeworth' (see *Nation*, No. 928) makes this volume of the "Famous Women Series" not so fresh and striking as its predecessors, but it is not unlikely that many persons will gain from it a more distinct idea of Maria Edgeworth. Mrs. Oliver had accumulated an abundance of anecdote and detail, which only a most skilful hand could have combined without confusing the outlines of the central figure. If her book left something to be desired in the absence of critical appreciation, the present volume only partly supplies the lack. Miss Edgeworth was not an author about whom a critic nowadays could say brilliant things; but that there is something more to be said of her than is to be found in either of these biographies, is proved by those gracious pages in the 'Book of Sibyls' that have embodied, as never before, the charm both of her books and of herself.

To Miss Edgeworth's father Helen Zimmern is unjust. He is measured by the standards of to-day, with a very scanty knowledge of his time and his surroundings. It is the difficulty of biographies made to order, that the writer rarely has the time, even when the desire is strongest, to study the subject from all sides, as one does who chooses to write a life only from personal motives. It is often said, "If Miss Edgeworth's father had let her alone," with an implied inference that free work would have been better work. On the contrary, it seems to us doubtful if she would have succeeded without her father's suggestion and training. Her work, even with all its great excellence, was not of the sort that compels its own doing.

But, all this aside, the book is heartily welcome, if only for the sake of the long extracts from the volume of letters and journals privately printed by the last Mrs. Edgeworth. The most significant, the most impressive, at this moment, are from the letters of fifty-three years ago, of which one might think the ink scarcely dry. The first explains why 'Helen' is not an Irish story:

"It is impossible to draw Ireland as she now is in a book of fiction; realities are too strong, party passions too violent, to bear to see or care to look at their faces in the looking-glass. The people would only break the glass and curse the fool who held the mirror up to nature—distorted nature, in a fever. We are in too perilous a case to laugh; humor would be out of season—worse than bad taste."

In the second the italics are hers:

"It is scarcely possible that this country can now be tranquillized without military force to reëstablish law; the people *must* be made to obey the laws, or they cannot be ruled after any concessions. Nor would the mob be able to rule if they got all they desire; they would only tear each other to pieces, and die *drunk* or *famish* sober. The misfortune of this country has been that England has always yielded to *clamor* what should have been granted to justice."

Samuel Sharpe, Egyptologist and Translator of the Bible. By P. W. Clayden. London: Kegan Paul, Trench & Co. 1883. Pp. iv.-320.

SAMUEL SHARPE'S long life of more than eighty-two years (1799–1881) was an uncommonly active and useful one. He is one of the most pleasing examples of that tolerably large class of Englishmen who, while mainly engaged in commerce or politics, devote their leisure hours to questions of science and literature. These men do not usually rise above the grade of amateurs—they rarely make important additions to the world's literary and scientific stores—but they make their own lives healthier and happier, and, by popularizing knowledge, cultivate the general community, and render the scholar's work easier. Mr. Sharpe was in a banking house from his sixteenth to his sixty-second year, yet he found time to study the Egyptian language, religion, and history, the languages of the Bible, and the current political, economical, and religious questions of his day, and to write well on all these subjects. He was descended on the mother's side from a long line of Dissenters, who naturally espoused the side of the Whigs. When the "heroic age of Liberalism" in politics began, he was just entering on his early manhood: there was the repeal of the Test and Corporation Acts in 1827, Catholic Emancipation in 1828, the Reform Bill in 1832, the abolition of slavery in the West Indies in 1834, the reform of the Corporations in 1835, and the Dissenters' Marriage Act in 1836. He threw himself into these reforms with the zeal of a man who had an immediate personal interest in them; thus, as only baptisms and not births were registered by the parish, and as he, being a Nonconformist, objected to having his children baptized at church, the four first of them were entered only in the informal non-parochial registers which the Dissenters kept for themselves, and which were finally legalized and collected under the new Registration Act of 1836. To the end of his life he continued to enter with keen zest into all political questions, and so late as 1872 republished an older magazine article in which he showed that the London Mansion House was built from fines unjustly levied on Dissenters. Born at a time when the terrors of the French Revolution and the menaces of Napoleon had been made the occasion of repressing all liberal movements in England, he lived to see almost all the restrictions of his youth removed, and Nonconformists invested with reasonable freedom in religion as well as in civil life. He did not confine himself to political subjects proper, but wrote articles for the *Inquirer* newspaper in favor of free trade, during the excitement and disorders of Sir Robert Peel's administration in 1841 and

1842, in favor of large Government grants for education, and in advocacy of the disestablishment of the national Church. He seems to have taken very sensible views of all these questions.

He showed equal interest in religious matters. Before his marriage he had been led, by the study of the New Testament, to sever his connection with the Established Church, and attach himself to a Unitarian chapel. "It was," says he, "upon consideration of the odium and legal disabilities that yet remained attached to a denial of the Trinity, that I made up my mind that it was a duty to bear my share of the burden." After this he spent much time and money in support of Unitarianism and of unsectarian education. He wrote books and gave them away, contributed articles to periodical papers, lectured on Biblical subjects, established chapels, and gave a good deal of money (in all about £20,000) to University College. It was while he was a member of the Council of this College, in 1866, that James Martineau, who had been recommended by the Senate of Professors as the most suitable man for the vacant chair of Mental Philosophy and Logic, was rejected by the Council on account of his theological opinions, and Professor De Morgan resigned his professorship "because the College had thus ignored and contradicted its fundamental principle of absolute neutrality in matters of theological belief." Sharpe's religion was of a positive and practical kind; he wrote vigorously against agnostic views, and did what he could to promote religious warmth and zeal among Unitarians, and to maintain a decided Christian character in the teaching of the ministers and the lives of the laity. His own religious life was a beautifully rounded one, vigorous and precise and earnest, but without narrowness or bitterness.

His Egyptian studies were truly remarkable. That a man who had left school at sixteen, and was occupied all day with business affairs, should, when he was over thirty, take up so difficult a subject as Egyptology, master its literature, and make useful contributions to the infant science in the shape of a number of books, is a sufficiently rare phenomenon to excite our wonder. At that time (about 1830) Young and Champollion had not been long dead, Lepsius had only begun his work, and Wilkinson had just published his first books on the hieroglyphics. Sharpe, who had an essentially practical, productive mind, studied Young, Champollion, Wilkinson, and Salt, learned Coptic by means of Tattam's lexicon, got the fragments of Manetho from Cory and other sources, and then wrote his 'Early History of Egypt,' which was published in 1836, and was the means of introducing him to Cullamore, Cory, Bonomi, and Lepsius. The next year he published a lithographed volume of 'Egyptian Inscriptions' and the 'Rudiments of a Vocabulary of Egyptian Hieroglyphics,' which were soon followed by 'Egypt under the Ptolemies.' This last has proved to be a work of permanent value. His hieroglyphic studies, which embraced not only history, but philological, astronomical, chronological, and theological questions, were no doubt useful in their day, but have long since been left behind by the advancing science; his book on the Ptolemies, giving a clear, well-written narrative of events, is still about the best in English on the subject. He made a fair reputation for himself among Egyptologists, and, with his strong common sense and independence of thought, would no doubt, if he had had better early training and more time at his disposal, have made an eminent scholar. His patience and industry were immense; he shrank from no labor necessary to gain his ends, and he had the habit of going, wherever it was possible, to primary sources of information.

He was not satisfied with studying Egyptian, but turned his attention to the Bible, and made a new version of the New Testament, after Griesbach's text, in 1840, and one of the Old Testament in 1865, learning Hebrew for this purpose. He was a pioneer in the work of revising the translation of the Bible; he began his New Testament before any decided popular interest had been manifested in the subject, and, according to his statement, it was he who suggested (in 1855) to Mr. James Heywood the motion in the House of Commons which resulted in the Revised Version of the Old and New Testaments. Sharpe's translations seem to have been widely circulated among Dissenters, and to have helped to prepare the way for the new official revision. In addition to this, he wrote a volume of 'Historic Notes,' consisting of critical remarks on the Biblical books, and a 'History of the Hebrew Nation and Literature,' besides a study of the Sinaitic inscriptions, and 'The Journeys and Epistles of the Apostle Paul'—all (except, perhaps, the Sinaitic inscriptions) respectable works.

Add to this array of books the numerous affairs which occupied him outside of his banking business, and we have the picture of a life well filled up with wholesome, useful work—a proof of what can be done by a business man, and an encouragement to men to do what they can. A large class of men of this stamp would give a healthier tone to society. Mr. Clayden has made an uncommonly interesting biography. Sharpe was concerned in important affairs, and was brought into connection with some noteworthy persons. There was his uncle, Samuel Rogers, the banker-poet; Bonomi, Crabb Robinson, Bishop Colenso, Chunder Sen, Miss Lucy Aikin, Alexander Dyce, Samuel Birch, besides others less known, about whom there is a good deal of pleasant talk. Samuel Sharpe's brothers were men of distinction: Sutton was Queen's Counsel, and highly esteemed enough to be placed on the Commission of three appointed to prepare new rules and regulations for the Chancellor's Court; Henry devoted himself heart and soul, for thirty years, to the education and improvement of the young workingmen of the town of Hampstead; William was a solicitor and Liberal politician; Daniel's geological and palæontological papers earned him a high place in that department of science in England. And not the least striking person in the household is the oldest sister, Catharine, who gave her whole life to rearing her younger brothers and sisters. It was a sturdy, capable family, worthy of its descent from Philip and Matthew Henry, and Mr. Clayden has given an excellent picture of the family and of the times.

Dictionary of Quotations from English and American Poets. Based upon Bohn's edition. Revised, corrected, and enlarged. Thomas Y. Crowell & Co.

THE anonymous editor of this issue does not indicate what (if any) additions he has made to the English portion besides the 1,200 quotations from American poets. The list of these poets is fairly representative, but, judged by the minor names included in it, does not betray a nice critical sense in the compiler. Longfellow furnishes one in seven (177) of the 1,200; Bryant, just half as many (89); Whittier, one in twenty-four (52); Emerson, one in thirty-three (37). It would not, perhaps, occur spontaneously to most people that the name next in order after these four should be that of Mr. Richard H. Stoddard, but so it is. No fewer than 34 passages have been derived from him; from Lowell, only 29. This seems all the more disproportionate when we find Keats credited with but 21, Coleridge and Wordsworth with but 15 each, Browning with 45, and Tennyson with 61. There would, in short, be no accounting for tastes in this instance if Mr. Stoddard had not supplied the preface to the present edition, and given it as his honest opinion that the maker of the Dictionary (presumably the last maker) has "triumphed over the multitude of difficulties which must have beset the making of it."

The English poets whose writings have been most freely used are, in the order named, Shakspere, Byron, Pope, and, pretty equally, Butler, Cowper, Milton, and Young. So voluminous a writer as Swinburne is wholly disregarded, as is also his superior in every way for the purposes of this collection, Clough. One feels this last omission particularly under the headings "Sea" and "Ocean," where, by the way, Mr. Stoddard does duty five times, four of the quotations being from one piece. But Wordsworth, too, should have been quoted here—if not otherwise, from the opening stanzas of his "Peele Castle":

> "Thy form was sleeping on a glassy sea.
> . . . . .
> It trembled, but it never passed away."

And we could have spared one of Mr. Stoddard's gems for the familiar lines from the "Ancient Mariner"—

> "As idle as a painted ship
> Upon a painted ocean."

What is, indeed, striking in this anthology is the failure to quote from poems which leap to the thought as soon as the catchword is uttered. "Good-night," for example, suggests instantly Shelley and Mrs. Barbauld, but we find here neither

> "Good-night? ah, no! the hour is ill,"

nor

> "Say not Good-night; but in some brighter clime."

"Warrior" as instantly recalls Wordsworth's "Happy Warrior," or Tennyson's

> "Home they brought her warrior dead";

but the compiler ignores both. So, under "Duty," we look in vain for a sample of the great ode which bears that title; under "Love," for

> "All thoughts, all passions, all delights,"

which is also plainly labelled; under "Mother," for something from Cowper's lines on his mother's picture; under "Shipping," for

> "With ships the sea was sprinkled far and nigh";

under "Fortune," for

> "Turn, Fortune, turn thy wheel."

Less distinctly, yet not obscurely indicated, is Milton's first sonnet to Cyriac Skinner, for the heading "Recreation," or for "Mirth" (where Milton is otherwise borrowed from). Under "War" or "Peace," Longfellow's "Arsenal at Springfield" might have been expected to prove serviceable; under "Parting," Coleridge's

> "They parted—ne'er to meet again,"

with its fine imagery (from "Christabel").

The index measurably supplies the defects of the classification of these quotations; but it is surely symptomatic that one must look under the prosaic "Flags" for either "banner" or "standard," which do not occur even as cross-references. Some inconsistencies, like the headings "Father" and "Mother" without "Brother" or "Sister," seem singular because of fine opportunities thrown away. Thus, there is "Pain" but no "Suffering," though Gray's "Eton College" stood ready with

> "To each his sufferings: all are men";

and there is "Misery" but no "Distress," though the latter would have made available the priceless line of Wordsworth's—

> "A deep distress hath humanized my soul."

Statique des Civilisations. Par Paul Mougeolle, ancien élève de l'Ecole Polytechnique. Paris: Ernest Leroux. 1883. 8vo, pp. 438.

THIS book consists chiefly of a very complacent and naïve attempt to bring the laws of the progress of civilization under the domain of one or two simple mathematical formulas. The author is impressed with the tendency of civilization to move away from the equator; and his peculiar logic—not so peculiar but that one finds something very like it in favor nowadays among men who are much more prominent in the semi-scientific world—enables him to arrive, after a considerable amount of pleasant and interesting writing, but very little hard thinking, at a formula which leaves nothing to be desired on the score of compactness and simplicity. There is a large and perhaps somewhat influential class of writers who use the terms of modern science—conservation of force, evolution, adaptation, and so forth—as though they were conjuring words, by the use of which the most intricate problems of nature and man could be instantaneously solved. It is in this spirit that a writer of some note in a learned English journal quietly assumes as the basis of a long article on idiosyncrasy, that it is impossible, nay, "unthinkable," that the mental equipment of a child should be superior to that of his parents. Writers of this sort, and their readers, might do well to see how amusingly easy it is, by an exaggerated use of such methods, and with the aid of a little mathematical jargon, to solve the darkest problems. M. Mougeolle has only to adduce one or two elementary laws of mechanics and to take a little liberty with his mathematics, in order to find the great formula of his science, viz.: that the intensity of civilization at any time is proportional to the square of the cosine of the latitude multiplied by a power of its sine. The power to which the sine appears increases directly as the time, and thus it is that the highest civilization is found further and further from the equator with the advancing ages. It is hardly necessary to add that the deductions from this formula accord precisely with the facts of history, as M. Mougeolle elaborately shows.

While this is the climax of the author's work, it occupies but a comparatively small part of the book, which is filled with a great variety of matters, some interesting, many amusing, but all easy. Perhaps the most striking example of this last all-pervading quality is the facility with which one can accurately compare the merits of two civilizations—contemporaneous or ages apart, contiguous or wide as the poles asunder. The magnitude of the greatest city is an infallible test; and fortunate it is for M. Mougeolle that such is the case, when he comes to compare France and Germany: "La comparaison des agglomérations urbaines dans les deux pays montre péremptoirement que la civilisation allemande est moins avancée que la nôtre: la population de Paris est presque double de celle de Berlin." There are plenty of things in the book almost as refreshing as this, especially some of the "science"; but one is struck by the excellence of the style, which would probably seldom accompany such matter in any book not written by a Frenchman.

The Amphitheatres of Ancient Rome. By Clara S. Wells. Boston: Cupples, Upham & Co.

THIS well-intentioned book contains a very complete résumé of the historical record and accumulated tradition concerning the Coliseum, with a chapter giving some information as to the similar buildings of ancient Rome. The authoress deserves credit for diligence in collecting her data, but one so fond of drawing morals from statements of fact as she is, should have drawn one from the architecture of the Romans, viz.: that no matter what the character of the building-stone they used, the cement always proved the strongest part of their walls, while the cementing in her work is the weakest. This is said without prejudice to any criticism on the plan of her structure, which is very disorderly.

The following is a good example of the filling in, and one of which the authoress is probably proud:

"May we not learn an important lesson from the durability of the materials used in not only this construction but in most of the Roman work? It shows us the almost indestructibility of thorough labor, which need not necessarily be slow, since in fourteen years the great building was erected, but which always demands devotion, energy, strength, and perseverance.

"And as, with these qualities, buildings may be put together defying the destructiveness of time, and which, though changed in form and place, still rest firm and unbroken, so spiritual and intellectual labor, performed under similar conditions of earnestness and activity, may also enter, unlabelled and unperceived, into the foundation and framework of social and religious beliefs, for century after century, even passing from one nation to another! Firm as are still the blocks of the Coliseum, the more intellectual ones, hewn by the poets and writers of the same period, have served to form by themselves a classical edifice, studied and extolled in all nations, and also, as stolen fragments, have entered into the compositions of vast multitudes of later literary men. And as the great amphitheatre was cemented with the tears of slaves and captive Jews, under the direction, if it be true, of a Christian architect, so, from the labor of the most despised classes, often greatest results are achieved. Time, the great Reverser of social classes, has brought to highest honor the then hated Christian sect, has preserved, in marvellous intactness and increase, the captive Jewish Race, but their then masters, the proud Romans, have disappeared, as a grand, unique class, dispersed among and intermingled with other nations, most of whom have been in turn their conquerors."

The authoress has the organ of utilitarianism fully developed, and her notion of the use to which the Coliseum may be put is, if not practical, at least humorous, though not intended to be so:

"I would suggest that the spirit of this century, being especially one of humanity and science as compared with preceding epochs, might be well expressed if the Coliseum—thoroughly drained and its splendid water-power utilized in the form of fountains, etc.—should be taken possession of by the Roman Society for the Prevention of Cruelty to Animals, and, under their direction, the whole be made, with the adjoining grounds, into zoölogical and aquarial gardens.

"The neighboring Botanical Garden forming a similar attraction, from this part of the city might emanate the most æsthetic and progressive ideas concerning the animal and vegetable world, for the community's best good. Nor would it be unfitting that walls which had resounded with the howling and cries of suffering beasts, as well as with the groans of human beings, should witness the happier existence of animals, and even a higher development of their capacities, by means of judicious training, until, in the Coliseum at last might be shadowed forth that promised 'Golden Age,' when the 'lion shall lie down with the lamb, and a little child shall lead them.'"

The publisher has done his duty by the essay.

BOOKS OF THE WEEK.

A Latter-Day Saint. American Novel Series. No. 1. Henry Holt & Co. $1.
Arthur, W. On the Difference between Physical and Moral Law. Fernley Lecture of 1883. Harper & Brothers.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 14, 1884.

The Week.

THE course of trade during the past week has been seriously affected by the disastrous floods in the Middle States. The slight improvement in the iron trade which was noticed at Pittsburgh and Wheeling a week ago has been more than neutralized by the inundation of the Ohio River, but, as this is only a temporary evil, it may be reasonably hoped that the improved condition of the chief local industries will show itself in a more unmistakable manner when the waters subside. Increasing attention is drawn to the development of the iron resources of North Alabama, and it is confidently affirmed that the centre of gravity, as regards the production of pig-iron in the United States, will be found in that region within the next few years. The price of pig-iron has advanced slightly—according to *Bradstreet's*, 50 cents per ton. The same authority gives the number of business failures during the week at 257, being 108 less than in the preceding week, and one more than in the corresponding week of last year. General merchandise traffic in the West, according to the Chicago *Tribune*, shows no improvement. Here in New York the improvement if any is very slight. The *Dry Goods Bulletin* says that travelling agents, who are on the road in large numbers, report that it is exceedingly difficult to secure orders, and that buyers from the interior, who are here in plenty, show no disposition to purchase beyond immediate needs, except in cases where the inducements are very tempting. Many classes of goods are selling below cost, but the stoppage of many mills in New England has stiffened the market somewhat. Business on the Stock Exchange is still confined to the large speculators and their following of room traders; nevertheless there has been a marked advance during the week, especially among the coal carriers. Sterling exchange has moved up to within one-quarter of a cent of the specie-exporting point, yet the opinion prevails that we shall not lose any gold of consequence.

Senator McPherson's bill to suspend the coinage of silver dollars until the 1st of January, 1886, is coupled with a proviso much worse than the law which it proposes to suspend—worse, indeed, than the original Bland bill, for which the existing Silver Bill was substituted. The Bland bill, as introduced, proposed to put silver and gold on the same footing at the mint, the coinage of either to be without limit. Nevertheless the coinage of silver would have been limited by the capacity of the mint to produce such dollars, and would not have been much if at all in excess of two millions per month. The McPherson bill (if correctly reported) proposes to make gold and silver *bullion* legal tender without limitations when bearing the mint stamp attesting their weight and fineness. This is more than the silver-men ever asked or dreamed of, and is so absurd that we can hardly believe that it is seriously meant. That part of the bill which proposes to make gold bullion legal tender is, of course, nugatory, because gold bullion passes everywhere at its full value without any mint stamp, and is preferred to coin for purposes of international exchange. It would be a measure of economy, if Mr. McPherson's views are to prevail, to place Government assayers at all the silver-smelting works in the country to stamp the pig metal legal tender as it comes from the furnace, because the expense of carting it to and from the mint would thus be saved.

There is a good deal of doubt as to whether the inquiry into the transportation question in Congress will result in any legislation at the present session. The constitutionality of any attempt to fix rates on railroads chartered by the States is by no means clear, and the only other course open to Congress is to provide for a Commission, with full powers of inquiry, to consider the whole subject and report upon it. This seems to Mr. Reagan and other earnest men a most unsatisfactory and half-hearted way of dealing with the railroads. Yet it is the only way to obtain trustworthy information on which to base legislation. Secresy is the curse of the railroad system of this country, and one reason why so many railroad men seem to have a craze for secresy is, that they dread the barbarous and communistic attacks on the property they manage which are continually threatened or attempted in State Legislatures and at Washington.

The Senate "outrage" investigating committee has decided to conduct its inquiry into the Copiah County case, in New Orleans, rather than in the county itself. The reasons given for this course are, first, that hotel accommodations are better in New Orleans, and second, that by sitting 150 miles away from the scene of the trouble the members of the Committee will be in no personal peril, and the witnesses will be more free from local pressure. About 100 witnesses are to be examined, and either before or after their examination the Committee will go to Mississippi and inspect the scene of the murder. This decision is probably a wise one in many ways. It will increase the cost of the inquiry somewhat, but there will undoubtedly be much less furious partisan feeling excited in Mississippi than there would be if the inquiry were to be conducted there. Whether the ultimate result will furnish as stirring a campaign document as would be the case if the "rebel spirit" were to be thoroughly aroused by an inquiry on the spot, is another question. We doubt very much, however, if, under the most favorable conditions, a strong campaign issue can be developed from the investigation.

It has been discovered in Washington that the bill regulating the Presidential succession has a bearing on the "first lady in the land" question—*i. e.*, the question as to who is the official female head of society. The bill provides for the performance of the duties of the office of President or Vice-President, in case of their absence, death, or inability, by a Cabinet officer, beginning with the Secretary of State. The bill, which has passed the Senate, thus puts the Cabinet next the President in dignity, and leaves the Speaker and his wife, who, according to some authorities, ought to come next to the President, out in the cold. Should the bill pass, the wife of the Secretary of State will thus be first lady in the land, beyond cavil or dispute. Apparently this is used as an argument against the bill, the idea of its opponents being that Mrs. Carlisle will never allow her husband to permit any bill to pass which threatens to diminish her social prestige. But the matter has got to be settled, one way or the other, sooner or later; and if conjugal lobbying is to begin, the wives of all the Cabinet officers will, no doubt, use whatever influence they possess to get it through, and their social power is very great. Mr. Carlisle might quietly "block" the bill, but this would be an abuse of his power which there is nothing in his character or career to warrant us in thinking probable; and even if political considerations counted for nothing with regard to it, we should say that the fashionable pressure of the Cabinet would be enough to get it through. It must be remembered that the social dignity of the Speaker is a matter in which his fellow-members' wives take little interest, most of them having the same relation to fashionable society in Washington that most Albany legislators have to fashionable society in New York.

The House Judiciary Committee has favorably reported an important bill relating to United States Circuit courts, and to the transfer of causes from State to Federal courts. The first change proposed is to increase the minimum jurisdiction from $500 to $2,000. The reasons given in the report are the growth of business in the country; the increase of population from 4,000,000, when the limit of $500 was fixed, to 50,000,000; and the fact that the Circuit courts are in most States "overloaded with business." The last is of course the real reason, the other two being merely explanations of the accumulation of business in these courts. The mere fact of an increase in population is no better reason for increasing the limit than the discovery of the telephone would be. The important question is, What is to become of the business crowded out of the Circuit courts by an increase of the limit? The Committee say it would go to the State courts. But in most cases when the Circuit courts are crowded the State courts are also, and it seems rather hard for Congress to clog the State tribunals merely for the purpose of clearing its own.

Other changes recommended are of much less doubtful utility. The bill restricts to the defendant the right to remove a cause from

a State to a Federal court. As the law stands, either party may remove, and the plaintiff now sometimes brings a suit in a State court with a deliberate intention of removing in order to worry the defendant and increase his expenses. To prevent this the bill requires the plaintiff ordinarily to abide by the forum which he selects in the first instance. His right to remove is preserved, however, in the only case in which there is any necessity for it—*i. e.*, when he shows that he cannot expect a fair trial in the State court. Other provisions are designed to restrict the abuse which has grown up of removing corporation suits into or bringing them in the Federal courts merely on the ground that the corporation is a "citizen" of another State. The clauses of the bill which relate to this topic will need careful examination by experts in this abstruse branch of practice. It is one which only a few lawyers in the United States know anything about, and a sweeping or careless change in the law may produce unexpected and undesirable effects.

It is evident that, so far as New York and Pennsylvania are concerned, all efforts to "pack" the delegations to the National Republican Convention this year will meet with strenuous opposition. In Pennsylvania the voters of the various Congressional districts are arranging for themselves, without assistance from the State Committee, plans of agreement by which they may select their delegates in advance of the meeting of the State Convention. In this State nothing definite has been done yet, but an early meeting of the State Committee is promised at which the matter will be considered. In Brooklyn the Independent Republicans are preparing to organize against any possible efforts on the part of Machine politicians to elect a delegation in their personal interest. There are evidences in both States of a powerful Republican sentiment in favor of independent and representative delegations, showing that the masses of the party realize, if the leaders do not, that the main hope of a Republican victory next November lies in the choice of a ticket which, both by its methods of selection and the character of its candidate, will command the support of all classes of Republican voters.

The suggestion of a South Carolinian paper that pistols should be taxed, and heavily taxed, is an excellent one. The wonder is that people who try to make the tax collector a champion of morality and order have not proposed this long ago. The pistol is, almost as much as whiskey, the curse of American society. It is a weapon with which probably nine-tenths of the crimes of violence are committed, and which more than anything else makes drunkards dangerous. The possession of it, too, suggests crime to thousands, if not tens of thousands, of men every year, who, without the pistol, would never have thought of it, or been tempted into it. In fact, it may be said of the revolver, with hardly any exaggeration, that it has proved to be, more than anything else, an aid to the criminal classes in their warfare against society. For military purposes its value is very small. It is only cavalry which is armed with it; and cavalry which relies on its pistols at close quarters is notoriously inefficient. For the protection of life and property it does little or nothing. The cases are rare indeed in which honest men "get the drop on" thieves, or burglars, or foot-pads. The cases are awfully numerous in which they are shot down by ruffians before they have time to draw a weapon at all. Moreover, the laws against carrying concealed weapons are, in all the States, notoriously inoperative. The evidence of violation of them is hardly ever obtainable except through the occurrence of some more serious crime. By far the surest way of diminishing pistol-carrying would be to make pistols dear by high taxation. A tax on them, too, could be easily levied, because it could be levied at the factory.

Mr. Austin Corbin, President of the Long Island Railroad, is rebuked by the *Sun*, we are glad to see, for suggesting lynch law to the Long Island farmers. We are loth to believe that he really said: "Their vigilance committees will make the way of the transgressor hard in future." The *Sun* calls attention to the fact that Mr. Corbin is a lawyer, or at any rate a Bachelor of Laws, having a degree from Harvard, granted in 1849. But a far more significant fact about him is that he is President of a railroad which is engaged in "developing" Long Island, and which needs for its prosperity a general belief that life and property are protected there, not by "the farmers" or vigilance committees, but by the law, by sheriffs, policemen, judges, district-attorneys, hangmen, and jailers. If these can no longer be relied on in Long Island, the Long Island Railroad is doomed to a precarious existence, and Mr. Corbin's various enterprises are exposed to the greatest possible risk. Lawyers do all sorts of queer things, but it would be strange indeed if railroad presidents were to begin to show signs of a belief in "the farmers" as a substitute for law in places to which they wish to attract population.

An important circular has recently been sent out by Keely to the faithful band of disciples who are enabling him to carry on his great work. It is pleasant to learn from this that he is able to "state positively (as regards the mechanical) that the first of the coming month will find all thoroughly completed, and there will be nothing left but setting up the transitive process, when all labors will terminate, preparative to operating and showing up the specific qualities of the perfect vibratory engine." The only point as to which there is any doubt is as to the time necessary for "the line of graduation." This, he frankly says, may only be a matter of a few days, or it may take weeks; but at any rate he feels that "the final issue is nigh at hand." He suggests that arrangements be made for an exhibition; but would any exhibition without the line of graduation be worth while? No stockholder who believes in Keely at all can fairly insist on his exhibiting such an invention as he describes before he completes it. It is only sceptics who do this.

The Boston *Herald* publishes a despatch of a very curious sort with regard to the estate of the late W. F. Weld, of that city. He died not long ago, leaving a property of $20,000,000. The despatch is dated Philadelphia, and states that the first account of the executors has just been filed in that city. The reason is that Mr. Weld, shortly before his death, changed his residence from Boston to Philadelphia. As the Pennsylvania tax system is the most enlightened in the country, and the Massachusetts system one of the most barbarous, is it not fair to infer that Mr. Weld went off quietly to die in Philadelphia in order that his estate might not be too severely bled at home? The case suggests, at any rate, a new kind of tax-dodging for rich men anticipating death. Tax-dodging within the State may be made difficult, but a bona-fide change of residence for the purpose of dying beyond the jurisdiction of the local law is hard to deal with. An executor cannot be extradited for administering the estate in Philadelphia, and, in fact, it looks as if the villain in such a case would escape justice altogether.

The death of Wendell Phillips has drawn a good deal of attention in Boston to the decline of old-fashioned American oratory. In going over the ground to find what survivors of the old school are left, the only important name that occurs to any one is that of Mr. Robert C. Winthrop. Various causes have been suggested for the gradual disappearance of the old school—among others the rise in importance of political discussions in the press. But this, though it would naturally have an effect on oratory, ought not to kill it altogether. There is a chance for the orator, even with an active press to discuss the same subjects which he discusses, in a perfectly cold and critical way. One reason why we have less finished political speaking than we once had, is that in Congress and our legislative bodies generally, there is no such thing as a real debate, in which the action of the body is determined by what takes place on the floor. To have good debates, you must have a debating body.

The *Paper World*, the trade organ, makes some dismal but appropriate comments on the two-cent movement among the morning papers, as "wholly unnecessary and unwise," and as "having inflicted the greatest injury on the journals themselves which took part in it, or upon such of them as have seemed to think it necessary to lower their standard with their prices." "To meet an increasing mass of people," it justly remarks, "with an apparently decreasing respect for their tastes, was an insult felt by former friends and admirers, that is frequently complained of." The illustrated papers, too, have very effectively joined in the protest against this decreasing respect for the popular tastes shown by some who have figured in the movement. It is not simply the collection of filth and triviality that is complained of, but the inordinate expansion and conspicuousness given to it. Any dirty little incident that can be "worked up" is spread out so as to occupy space enough for the story of a revolution or the biography of a deceased hero. This is, of course, not tell-

ing the news, but providing low literature. That it is going to prove a great business mistake is the general belief and hope, which is not weakened by the ruffianly way in which all criticism of it is resented by the performers in it.

A new kind of coöperative housekeeping, described in the *Sun* of Sunday, is said to prevail in apartment houses suited to persons of moderate means :

"There is a common kitchen for many families, and out of what they all contribute a superior or an artistic cook can be employed. They can thus get, with certain slight limitations inseparable from cooking on a large scale, as good meals as the richest enjoy—or, at least, meals which are beyond reasonable criticism. Maids are also supplied in such houses, and the domestic machinery accordingly moves with little friction. There is also much less repugnance to such service than to service in a single family."

Apartment life with meals beyond reasonable criticism, and servants "supplied," would meet a "long-felt want" in New York. But who engages and discharges the cook and the "maids"? Is a vote taken at the close of every day? If so, how, in case of disagreement among the families, is the matter settled? The details of the administration of such a coöperative system are far more important than the mere fact that the experiment has been tried; and we think it wrong in our contemporary to withhold the facts, which it says promise to dispose of the whole servant question.

Governor Cleveland has selected Professor Theodore W. Dwight and Messrs. George B. Sloan, D. W. Ogden, Norman W. Allen, and Walter M. Thayer as Commissioners on Prison Labor, and the Senate has promptly confirmed them. The selections are very good. Professor Dwight is the President of the State Prison Association. His associates are all competent men, and are all capable of giving us, if they have time, a thorough and non-partisan investigation of the question. The bill authorizing the Commission originated in the Prison Association, and was in no sense a partisan measure. The purpose of its authors was to get at the real merits and defects of the present system of convict labor, and propose such remedies as would give the State the system which would be most desirable and at the same time most beneficial to all parties. An attempt was made in the Senate, by the Hon. "Tim" Campbell and other like statesmen, to give the bill a partisan aspect, but the Governor was not influenced at all by this manœuvre. He has appointed a Commission which will work in entire harmony with the spirit of the bill under which they are to act, but the shortness of the period allowed for the report—three weeks—makes it unlikely that they will be able to do justice to the subject.

Mr. Clarence Cook writes to the *Times* explaining why he did not appear on the witness stand during the late Feuardent-Cesnola trial. The reason, as we suspected, is "to be found in the fact that he had no evidence to give as to facts within his own knowledge." This, however, makes another explanation necessary. If he knew nothing of his personal knowledge as to the facts in the case, why did he make such a dreadful uproar about it for two years in letters and pamphlets? Is it really true that he knew nothing about "the fraudulent patchwork of unrelated parts"? It would seem so, and we suspected as much. When the fraudulent patchwork was put out on the floor of the Museum two years ago for public inspection, Mr. Cook's post of honor was at its side, but he was not there. He ought to have been there each day through the whole week from 9 to 5 (with occasional intervals, of course, for rest and refreshment), pamphlet in hand, showing how the fraud was committed and covered up. Mr. Cook now says that his activity was all along of his love for Mr. Feuardent and his hatred of Mr. di Cesnola. But nobody has done more for Mr. di Cesnola than Mr. Cook. Nothing has helped that gentleman so effectively as the failure of his opponents to follow up their noise with proof. No writer who respects himself ought to take part in a controversy of this kind with the deliberate intention of confining himself to "hollering."

General Gordon has got to Berber, about 150 miles below Khartum, and without an escort. This is rather remarkable, but the worst is not over, as the rest of the way to Khartum will probably be more dangerous. As the London *Times* says, "the dromedary which carries him probably also carries the fortunes of the Ministry." If he should be killed or captured, it would undoubtedly be a heavy blow for the Government, but there is not much chance of its proving fatal. The majority of the voters are hardly ready to give the solution of the Egyptian problem to the Tories, in their present condition, and with the memory of Lord Salisbury's foreign policy still strong. The appearance of Professor Tyndall on the scene to clamor for a more vigorous policy, recalls a dithyrambic glorification of the bombardment of Alexandria which he issued last year from Switzerland. He then said that this operation satisfied him "that he had a country," Arabi Bey's doings in Egypt apparently having caused him some doubt on that point. Mr. Tyndall is evidently more at home among the clouds and the glaciers than in politics, either home or foreign.

The "remedy" of General Stone, that the British Government should send 100,000 men into the Sudan to reconquer that country—50,000 to be Indian troops, the rest British—will probably be received by the British taxpayers as one of those Yankee jokes from which they have of late derived so much amusement. Those who know Egypt or care about the fate of the country can hardly do better work just now than explaining why the Egyptians ever went into the Sudan at all, or what good they did while there. It may be that there is, as General Stone suggests, something wrong in giving Egyptian money just now to the English bondholders, but if the alternative is, as he proposes, the use of it to make war in the Sudan, it is decidedly better to let the bondholders have it, even if they use it in luxurious indulgence. In their hands it will at least not help to swell the sum of human misery, by sending thousands of men to perish in trying to subjugate people who have done Egypt no harm, and to whom Egypt can do no good.

The Queen's book, if the telegraphic summary of it be fair, will, we fear, be pleasant reading to the extreme Radicals all over the world. Its contents are, of course, perfectly harmless, and in places doubtless pathetic and interesting; and if it were written by a widowed mother who liked taking the world into her confidence about the joys and sorrows of her domestic life, would hardly be open to any but approving criticism. But it is the work of a very highly paid sovereign, whose interest in and knowledge of the politics of the great Empire over which she reigns have been lately represented as very great. Of these things the book seems to contain hardly a trace. She talks of the world as if it were made simply for royal personages to be happy or suffer in. Tell el-Kebir was important to her apparently because the Duke of Connaught was in the field, and all political events are seen from the same domestic point of view. The exaltation of John Brown, too, a common Highland gillie, who occasionally got drunk, which has so much tried the patience of the English public, is persisted in. His menial devotion to his mistress is rated so highly as to lead her to disregard the *convenances* of ordinary English life, not to say of royal life, for the purpose of doing honor to his memory. He is treated in the Queen's book as if he were a great soldier and a great statesman; and the only English statesman who receives any favorable notice is the one of recent times who has been most distinguished as an obsequious flatterer and courtier. In fact, the work is one which no real friend of royalty in our day ought to be able to read without a tremor.

Bradlaugh has resigned his seat, and has doubtless gone back to Northampton for re-election, which he will secure. That is to say, the one body of persons in the kingdom to whom his qualifications as a legislator are a real concern think they are very good. Moreover, the majority of the House has put him in a position which makes him the champion of the old principle for which Wilkes fought a century ago—that the constituency is the supreme judge of the representative's fitness, as long as he rests under no legal disability. The result is that the Northampton people cannot throw him overboard if they would. He will certainly sit in the next Parliament with all the honors of a martyr, and with some of the honors of a defender of the constitutional rights of electors; and the Parliamentary oath and the cause of religion and morality will be no better off than before.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, February 6, to TUESDAY, February 12, 1884, inclusive.]

DOMESTIC.

MR. MORRILL (Rep , Vt.) addressed the Senate at length on the subject of the new library building on Thursday, showing the insufficiency of the present and the amplitude of the proposed accommodations. The total ultimate cost of the building, he said, would be $3,362,000, and as the edifice would last for centuries, this sum was not too great. The plan would accommodate 3,000,000 books. A bill was passed by the Senate on Tuesday appropriating $500,000 to begin the work.

The Senate Committee on Commerce on Thursday authorized Senator Frye to report to the Senate for passage a new bill for the relief of American shipping. A drawback of 90 per cent. is allowed on imported materials used in the construction of vessels built in this country for foreign account, whether such vessels are built wholly or only in part of foreign materials. The Postmaster-General shall be authorized to contract with American vessels for carrying United States mails to and from foreign ports for a sum not exceeding $1 per nautical mile for the round trip, the contracts to be made after advertisement with the lowest bidders.

The Senate Shipping Bill, as reported accordingly by Senator Frye from the Committee on Commerce, was taken up by the House Shipping Committee on Monday, and Representative Hunt was authorized to report to the House a bill covering such features of the Senate bill as are not embodied in the Dingley bill. These, in substance, authorize the Postmaster-General to contract with American steamers for carrying mails at prices which shall not exceed the net proceeds of postage collected on foreign mail matter for the preceding year, nor one dollar a mile.

The Senate debated the Greely Relief Bill again hotly on Friday. Mr. Ingalls criticised Secretary Chandler for buying foreign ships for the relief expedition, and for dictating to the House conferees their course.

Senator Riddleberger on Monday made a speech on his resolution to investigate alleged violations of the Civil-Service Act. He said that half of the persons in the departments put down as coming from Virginia came from other States ; that twenty wounded soldiers have been discharged from the House, and that the reason given them by those who discharged them was that they had not voted right.

The House of Representatives debated its rules on Thursday. The proposed Committee on Woman Suffrage was defeated, as was Mr. Skinner's plan to establish an executive committee of fifteen members, on the eight-to-seven plan, to consider all bills reported favorably from other committees, and rank them in order of merit on an executive calendar.

Mr. Morrison hoped to have his tariff bill rushed through the Committee of Ways and Means and reported to the House by Tuesday, but at a meeting on Thursday two things were determined—first, that the majority of the Committee would insist that hearings be given to persons interested; second, that if it was necessary that members of the Committee should have schedules to know what the effect of the bill was to be, it was very important that those whose business is to be affected by the proposed legislation should have the same information. This will cause delay.

The House Committee on Appropriations, at a meeting on Monday, agreed to report a bill for the immediate appropriation of $300,000 for the sufferers by the floods along the Ohio River and its tributaries. The bill was passed by the House and by the Senate.

The House Committee on Coinage, Weights and Measures on Monday agreed to report a bill for the exchange of the trade dollar for standard dollars, or for their receipt for Government dues within two years. The Committee on Banking and Currency were, on Tuesday, discharged by the House from further consideration of the subject.

Mr. Potter (Dem., N. Y.) introduced in the House on Tuesday a new funding bill. It authorizes the Secretary of the Treasury to convert the present 3 per cent., 4 per cent., and 4½ per cent. bonds into new 2½ per cent. bonds, each new bond to be payable at the same time and on the same conditions as the bond for which it is substituted. In making the exchange of the new bond for 4s and 4½s the Secretary is authorized to pay such sum in each case as shall be equal to the amount saved in interest to the country. The bill reduces the tax on circulation of national banks one-half.

The State Senate on Tuesday passed the bill prohibiting the renewal of any of the prison contracts now in force or the execution of any new ones. In the Assembly there was a lively debate on a bill to spend $30,000 in enlarging a lock on the Erie Canal. The proposal is an experiment which, if successful, would result in a general and gradual enlargement of the Erie Canal. This brought on a discussion of the whole question. The bill was finally ordered to a third reading without objection.

In the Senate at Albany, on Thursday, the Assembly Prison-Labor Commission Bill was passed by a strict partisan vote of 17 (Rep.) to 11 (Dem.).

The bill to limit the hours of work of horse-car drivers and conductors in New York and Brooklyn was passed by the Assembly, on Wednesday, by a vote of 80 to 32. The opposition was Republican, with one exception. A resolution in favor of biennial sessions was offered in the Assembly on that day.

John J. O'Brien has been elected Chairman of the New York Republican County Committee. This is a substantial victory for the old Machine.

The Virginia House of Delegates on Thursday passed a bill, which has been adopted by the Senate, taking the election machinery of the State out of the hands of the Mahonites.

High water and dangerous floods to an unprecedented extent prevailed in the large rivers east of the Mississippi during the week. Pittsburgh, Cincinnati, and Wheeling were the greatest sufferers, thousands of people being made homeless. The damage to property will reach several million dollars. Appeals for relief have been sent from Cincinnati and other towns.

Henry S. Church, Chamberlain of the city of Troy, is missing, and it has been discovered that he is a defaulter to the amount of about $80,000.

Arnold Henry Guyot, Professor of Geology and Physical Geography at Princeton College, died on Friday at the age of seventy-six. He was a native of Switzerland, a fellow-student and friend of Agassiz, and a laborer with him in the study of the Alps. Professor Guyot was the first to discover the laminated structure of glaciers, and he made a thorough study of the distribution of erratic boulders in the Alps to determine the mode of their transportation. He came to this country in 1848, following Agassiz, and delivered a series of lectures in Boston, which gave him a great reputation. They were published in a book called 'Earth and Man,' which has run through many editions. He was the author of a valuable series of geographies, and of a book on 'Creation,' soon to be published, the last proof sheets of which he read a few days before his death. For thirty years he was a successful and respected professor at Princeton.

The Rev. Simeon North, D.D., LL.D., ex-President of Hamilton College, died on Saturday night at Clinton, N. Y., aged eighty-two. He was graduated from Yale College in 1825, and was President of Hamilton College from 1839 to 1857. His published works consist principally of sermons and special discourses.

Mr. Thomas Kinsella, editor of the Brooklyn *Eagle* since 1861, died on Monday afternoon. He was a member of Congress in 1870–2. He was one of the earliest and most zealous advocates of the Liberal movement in 1872. Since then he has been a member of many Democratic conventions and of the State Committee of his party. As an editorial writer he was forcible and direct, and as a manager he carefully superintended all departments of his paper.

The will of the late President H. E. Packer, of the Lehigh Valley Road, leaves the bulk of his property to his wife. At her death twenty twenty-thirds of it goes to the Lehigh University at Bethlehem, and three twenty-thirds to St. Luke's Hospital, Bethlehem, both of which were built and liberally endowed by his father. The estate is estimated at over $4,000,000.

Wendell Phillips's funeral in Boston on Wednesday was conducted without any ostentation. Services were held in the Hollis Street Church in the forenoon. The coffin was borne up the central aisle, Samuel E. Sewall, Dr. O. W. Holmes, Theodore D. Weld, John M. Forbes, Wendell Phillips Garrison, Lewis Hayden, Wm. I. Bowditch, Charles K. Whipple, Richard P. Hallowell, and E. M. Davis serving as pall-bearers. The plate was inscribed "Wendell Phillips, died Feb. 2, 1884, aged 72 years." The Rev. Samuel Longfellow and the Rev. Samuel May conducted the services. There was no address. A company of the Sixth Regiment, accompanied by the Robert G. Shaw Veteran Association, colored, when the coffin was borne out from the meeting-house and placed in the hearse, acted as an escort. The procession moved to Faneuil Hall, where the body lay in state for several hours and was viewed by thousands of people. In the afternoon, about 4:30 o'clock, the procession was reformed and the body was taken to the family tomb in the Granary Burying Ground, in the heart of Old Boston. There were no services at the tomb.

A great audience in Plymouth Church, on Sunday morning, listened to a sermon by Mr. Beecher upon Wendell Phillips. Mr. Beecher spoke first of the anti-slavery days, and then of the career of Mr. Phillips, of whom he said in closing: "When pigmies are all dead, the noble countenance of Wendell Phillips will still look forth, radiant as a rising sun—a sun that will never set. He has become to us a lesson, his death an example, his whole history an encouragement to mankind and to heroic manhood." Felix Adler eulogized the great orator in Chickering Hall, and several other similar discourses were held.

FOREIGN.

In the House of Commons on Wednesday there was an exciting scene. Mr. Gladstone said that the Government did not feel called upon to adopt fresh measures because of Baker Pasha's disaster. Lord Randolph Churchill, Conservative member for Woodstock, gave notice that he should introduce an amendment to the address, asking the removal of the present Ministers and the substitution of others who were fitter. Forty Conservatives supported the amendment, which the Speaker ruled out of order. Lord Randolph Churchill thereupon moved that the House adjourn for the purpose of calling attention to urgent public business. All the Conservatives, including the leaders, rose to their feet in support of the motion. Great excitement prevailed. After a warm debate the motion was negatived without a division.

Following close on Baker Pasha's disastrous defeat came the announcement from Suakim on Wednesday that the rebels had surrounded and destroyed Tewfik Bey and

400 followers between Sinkat and the coast. The report was premature.

Further excitement was created on Thursday by a rumor that General Gordon had been captured, but it proved to be unfounded. On the same day a letter which Gordon had written was made public, in which he said that England acted wisely in abandoning the Sudan. "For," he said, "unless England shall secure the Sudan in the possession of a good government, it ought not to conquer the country itself nor allow others to do so."

General Gordon arrived safely at Berber on Monday. He asked for robes of honor and swords to distribute to local dignitaries. Sir Samuel Baker believes that General Gordon will arrive at Khartum in safety, but will be powerless when he gets there.

The Sudan crisis was still further intensified on Tuesday by the news brought to Suakim by a friendly Arab chief that Sinkat had been captured by the rebels. Tewfik Bey, preferring death to surrender, blew up the fortifications, spiked the guns, and made a sortie. His 600 men were all massacred. There was also an alarming rumor that Tokar had also fallen. A Cabinet Council was immediately summoned to discuss Egyptian affairs. Seven men-of-war belonging to the Channel Squadron were ordered to Egyptian waters.

In the House of Lords the Marquis of Salisbury made the motion that in the opinion of the House the recent lamentable events in the Sudan were largely due to the vacillating policy of the Government. After a speech by the Marquis of Salisbury on the motion, Earl Granville replied, saying that it was necessary now for the Government to be careful, so as not to clash with the larger views of General Gordon. The Government, however, had ascertained that it would not interfere with Gordon's plans if a force were sent to act around Suakim, with a view to the relief of Tokar. Since the defeat of Baker Pasha it had been altogether impossible to relieve Sinkat. The Government had no intention of annexing Egypt. The Marquis of Salisbury's resolution was carried by 181 to 81.

In the House of Commons a similar motion was made by Sir Stafford Northcote, who in his speech declared that the conduct of the Government would greatly complicate the present issues; that it would probably close the great trade route from the equatorial lakes to the Red Sea, give impetus to the slave trade, and greatly diminish English prestige. Mr. Gladstone was greeted with cheers when he rose to reply. He pointed out that the present situation in Egypt had not been created by the Government, but had been left to them by the previous Ministry. Seven thousand men, he said, had been ordered to Suakim. General Gordon had a plan of his own for restoring the Sudan to a peaceful condition by giving back to the former rulers their ancestral powers usurped by Egypt. He denounced as a gross error the Dual Control which had been left him as a legacy. In conclusion he asked for the Government the acquittal to which it was entitled. After several more speeches the debate was adjourned.

The Dublin *Irish Times* asserts that there is a strong difference of opinion among the Parnellites in regard to their votes on Sir Stafford Northcote's motion of censure apropos of the Government's Egyptian policy.

Admiral Hewett has been invested with the civil and military command of Suakim, and that place is believed to be perfectly safe.

The Paris *Figaro* on Monday asserted that El Mahdi's troops had taken Sankeit, near Kassala, and Ravina, a small seaport north of Suakim. It said an English gunboat had been despatched to shell Ravina.

Prof. Tyndall, who is a Liberal, has written a letter strongly condemning the Government's Egyptian policy. For more than three years, he says, it has been leading England from disaster to disaster. The latest shame and scandal which their cowardice has inflicted, bring the country by no means to the end of its humiliations.

In a leading article on Saturday morning the *Pall Mall Gazette* said that England, although opposed to the annexation of Egypt, would be under the necessity of exercising absolute authority over that country for the next five or ten years. The exigencies of the present crisis demanded immediate action, and further delay on the part of England to assume control would be nothing less than criminal

Mr. Bradlaugh on Monday appeared at the table in the House of Commons and administered the oath to himself. He was ordered to withdraw until the House had considered his case. Mr. Gladstone made no motion, whereupon Sir Stafford Northcote moved that Mr. Bradlaugh be not permitted to take the oath. This motion was carried by a vote of 280 to 167. Another motion, made by Sir Stafford Northcote, that Mr. Bradlaugh be excluded from the precincts of the House, was carried by a vote of 228 to 120. Mr. Bradlaugh voted on both motions. The law officers of the Government were instructed to prosecute Mr. Bradlaugh immediately for voting in the House. He is liable to an aggregate penalty of £1,500. On Tuesday he applied for and was granted the Chiltern Hundreds, which is equivalent to a resignation. On motion of Mr. Labouchere, the House granted a new writ for an election to fill the vacancy, and Mr. Bradlaugh immediately started for his constituency at Northampton.

A Conservative moved in the House of Commons on Thursday evening that a measure to prevent the importation of animals suffering from foot and mouth disease be introduced without delay. Mr. Gladstone would not give it precedence over the great measures mentioned in the speech from the throne. The motion was rejected, 251 to 200. Mr. Parnell on Friday moved an amendment condemning the Government policy in Ireland. Mr. Trevelyan replied, and the debate was adjourned.

The trial of the fifty-two members of the Park Club, London, charged with gambling in playing baccarat at the rooms of the club, was concluded on Thursday. The proprietor of the Club and the members of the Committee were fined £500 each and the players £100 each. An appeal from this decision was lodged.

Sir Edward Mortimer Archibald died in London on Friday at the age of seventy-three. For many years he was British Consul-General with headquarters in New York city.

Thomas Chenery, editor of the London *Times* since 1877, died on Monday, at the age of fifty-eight. He was a distinguished Oriental scholar and the author of various literary and political works.

Queen Victoria's new book, which is a disconnected diary of events from August 21, 1862, to September, 1882, was distributed to the press in London on Monday. A number of extracts from it were immediately telegraphed to this country. The entire book is devoted to domestic and family affairs, political allusions being only incidental. There are many feeling allusions to the faithfulness of her late personal attendant, John Brown.

The Parisian newspapers are indulging in much sarcasm at the failure of England's Egyptian policy. An Irish paper congratulates the False Prophet on his success.

Official despatches from Tonquin, received in Paris on Friday, announced that the rebels in the provinces of Namdinh and Sontay had been dispersed with heavy losses. The rebel leader Dedoc was wounded, and more than 400 of his followers were slain.

Admiral Courbet has written to Admiral Peyron, French Minister of Marine, bitterly complaining of being superseded by General Millot in the command of the French forces in Tonquin, just as he is about to attack Bacninh.

A despatch from the French Bishop in Tonquin was published in Paris on Monday to the effect that one priest, twenty-two catechists, and 215 Christians had been massacred, and that 108 mission-houses had been destroyed. The affair turns out to have been an old one.

The negotiations of Admiral Galiber, the French commander, with the Malagassys have been resumed, and there is a prospect that they will be concluded successfully. Meantime the Admiral has been recalled.

A letter from Gaboon, dated December 7, asserts that the expedition of M. de Brazza in Africa is a complete failure, his stores have been ruined, a hostile chief is in his way, and Brazzaville no longer exists. Stanley is triumphant. Later French advices deny the story.

The funeral of M. Rouher, the distinguished Bonapartist, in Paris on Thursday was very quiet. Many policemen were present, but no demonstration was made.

The Pope has addressed an encyclical letter to the French bishops. His Holiness deplores the moral and intellectual condition of the various European nations, including France. He exhorts the bishops to do their utmost to remedy the evil.

The Pope and the Cardinals have decided to address a note to the Powers, pointing out the consequences to the Church which will result from the conversion of the real property of the Propaganda into Italian rentes, as ordered by the courts.

It is denied that coolness has arisen between the Vatican and Prussia. Negotiations are still continuing.

The select Committee of the Austrian Reichsrath appointed recently to consider the extraordinary measures adopted by the Government for Vienna and other places in view of recent Socialist disturbances, approves of these measures provided they shall be limited in their application to Anarchists. If the Reichsrath refuses to reënact the Anti-Socialist law a dissolution is probable.

United States Minister Foster and the Spanish Minister of Foreign Affairs on Sunday signed the protocol maintaining the commercial treaty concluded with the preceding Spanish Cabinet, with the exception of the consular dues, which are reserved for ratification by the Cortes.

The Spanish Government prohibited the meeting of the Republicans which had been announced to take place on February 11. This was to be in commemoration of the proclamation of the republic, which occurred on February 11, 1873.

A revolt has broken out in Crete in consequence of the Turkish attack on the privileges of the Greek Patriarch. The Porte has sent orders to despatch 500 soldiers to Crete.

Mount Ætna is now in a state of eruption.

The death of Cetewayo, the famous Zulu Chief, was reported on Saturday from South Africa.

Advices from Cape Coast Castle, West Africa, of January 14, state that the King of Kinjabo had assembled troops to resist the Anglo French Commission for marking the boundaries of the west coast. The English Commissioner had sent for assistance, and French men-of-war were landing troops.

The bodies of De Long and other *Jeannette* victims were shipped from Hamburg on Wednesday for America.

THE TELEGRAPH AND THE GOVERNMENT.

Mr. Gardiner G. Hubbard made on Friday a very strong presentation of the case for the postal telegraph before the Senate Committee on Post-offices and Post-roads. He told again the now familiar story of the way in which the Western Union has been built up by the absorption of competing lines, and drew from it the inference that the telegraph can never be anything but a monopoly; that the greatest company is sure to swallow up as many small ones as may be started. His plan is to have the Government assume the telegraphic business as a part of the postal service, and he would not agree to make any compensation to the Western Union for the destruction of its monopoly, in spite of the Act of 1866, under which the companies, in return for certain privileges, conceded the right of the Government to purchase their lines. Mr. Hubbard's doctrine is not that "innocent stockholders" are not entitled to compensation when the Government takes away their business, but that the stockholders of the Western Union are not entitled to compensation because none of them are "innocent," and because the lines of the company have not been built by the contributions of the stockholders. All the additions made to the 75,000 miles of wire which the company had in 1866 have, he says, been paid for by the public. Those who purchased stock, he says, since this, have associated themselves with the "guilty," and are guilty themselves, and ought not to have any compensation.

We believe, for our own part, that every argument which has ever been used in favor of the carriage of letters by the Government can be used now in favor of Government telegraphy, besides some additional ones, suggested by the management of the Western Union. But both the discussion of the matter and the legislation about it ought to be governed by purely business considerations. Nothing can be more dangerous than attempts to deal with such questions on moral grounds. We do not think any stockholder of the Western Union would have a right to complain if the Government started a rival telegraphic line tomorrow. Every stockholder bought his stock subject to the risk of competition from any quarter, public or private, and must have known that he so bought it. The extent to which the Government shall undertake to serve the public, either in the transmission of messages or in any other way, is something which must always be determined by the interest or convenience of the whole people, and not of any portion of the people. If, in assuming any work or function, its rivalry causes loss to anybody, it owes him no compensation unless it takes his property. If it took the Western Union lines, it would have to pay the stockholders a just compensation; but if it simply started competing lines, it would owe them nothing, and ought not to give them anything whatever.

This distinction is plain enough, and it is the only distinction the case admits of. There are not in the eye of the law, and ought not to be in the eye of Congress, any "guilty" stockholders of the Western Union. There is nobody connected with it who ought either to receive or be deprived of any pay, or reward, or indemnity from the State because he is either good or bad, or because he acquired his property or uses it in a manner which moralists disapprove, or which some people think less favorable to the public interest than it ought to be. No man in America is for legislative or judicial purposes "guilty" whom the law has not found guilty King John established this principle clearly when, six centuries ago, he agreed not to go or send upon anybody, or molest him in any manner whatsoever, except through the law of the land and the legal judgment of his peers.

The matter is worth attention because there is a growing tendency to settle or attempt to settle purely business questions on vague moral grounds. During the strike of the telegraphic operators last summer, a great many people and some journals produced the extraordinary doctrine that an employer whom the public considered unscrupulous or grasping ought to pay higher wages than other people, and that his books ought to be overhauled by a committee to see whether his profits would not enable him to do so. There is now a bill before the United States Senate which gravely proposes to seize the whole property of the Mormon Church, and lodge it in the hands of Government trustees, because the country disapproves of the views of the Mormons about the sexual relation. Nay, the same bill proposes to abolish a Mormon Missionary Society and confiscate its property, because some of the converts on their arrival here are likely to commit adultery. As long as the stockholders of the Western Union, from Gould down, have not violated the law of the land, we have no right to discriminate against them as regards their property rights, in any legislation whatever, no matter how much we may disapprove of their methods. If any telegraphic company would be entitled to compensation for Government competition, they are; if no telegraphic company would be entitled to it, they are not. Their mode of getting their stock ought not to affect the question in any way. It would be a dark day for many good men if people's title to their property became dependent on their popularity, or on the view taken by the newspapers of their moral condition.

THE PUBLISHERS AND COPYRIGHT.

The *Evening Post* publishes Mr. Dorsheimer's international copyright bill as amended and reported to the House, together with a letter to Mr. Dorsheimer from Mr. George Haven Putnam, of this city, setting forth the views of his house on the subject. We wish very much that his example were likely to be generally followed, for it is now nearly certain that the measure will be defeated, if at all, by the publishing interest. The House Judiciary Committee are unanimous in its favor, the views of the President have been presumably expressed by the recent letter of Mr. Frelinghuysen, there have been no symptoms of any public disapproval in the press; but all this, it is well known, does not settle the matter. We learn privately from Washington that "pressure" is already making itself felt in the House, and that more is threatened later in the Senate, in order to kill the bill by hampering it with restrictions designed to protect American book manufacturers; requirements that the book shall be totally remanufactured in this country, or assigned to an American citizen, etc., etc. This is, of course, nothing but the old plan of mixing up the two questions of property and protection for the benefit of the American publisher, and it cannot be done except by means which more or less directly encourage piracy. They all make copyright dependent upon the favor of a publisher, and by this we mean that they do not protect the author till he can get some publisher to come between him and the pirates. In the case of books by well-known authors, books sure to sell themselves, there would be no difficulty in getting this protection. English publishers would rival each other in offering it to the American author, and *vice versa*. But in the case of all the new books by unknown men—the great mass of books—forcing the author to select a foreign publisher is requiring him to get from a third person the protection which the Government itself ought to afford. Combined, as this requirement was in the old Harper treaty, with another, making it necessary for him to obtain the protection of the publisher within a limited time, it seemed to many people to put a positive premium on piracy. However this may have been, copyright means the right of the author to sell copies of his book, no matter who prints or manufactures it; and to say that he shall enjoy his property if he can get an American or an English publisher to print it, is nearly as gross a piece of favoritism to publishers and legislation for their benefit as if the publishers who might reprint were named in the bill. Everybody would perceive this at once if an attempt were made to protect the copyright in particular books in this way. If Congress, for instance, were to pass a law that Tennyson might have an American copyright provided his books were put into the hands of either the Harpers or the Appletons in this city within six months, or if the English Parliament were to pass an act granting copyright to Mr. Longfellow's heirs, on similar terms, the measure would be seen to be a private bill for the benefit of the publishers. But the fact that the books and the firms are not named in the act makes no substantial difference.

Under these circumstances it seems to be a positive duty for all the great publishers to come out and say distinctly whether they are in favor of simple author's copyright or not. On this point we cannot agree with Mr. Putnam's suggestion that "it may be necessary, in order to head off some of the opposisition to copyright," to make some concessions to "the protectionists." The "protectionists," it should be remembered, are either publishers who believe substantially in the scheme embodied in the Harper treaty, of making remanufacture here a condition of copyright, or else they are mere pirates, who, finding that the cry of "cheap books" no longer serves their turn, are now making a cry for protection to American industry a cover for their business.

There are two fatal objections to this plan. It has been tried once and broken down, and, besides this, the moment any attempt is made to "head off" some of the opposition to the bill by concessions, it gives a plausible reason for every book publisher, binder, printer, and pirate to run on to Washington and demonstrate to Congress that what his branch of business needs is this or that little device—a little change in the period of time here, a slight alteration in the tariff there, and so on until the bill is reduced to the condition of the Harper treaty, as explained by Mr. Frelinghuysen, in which absolutely nothing can be done with it. The moment, too, that the American publishers are let in, English and Canadian publishers must be heard, for their business and their copyright law are affected; and so the result of attempting to "head off" opposition will be to get the whole subject into precisely the confusion from which the present amendment is designed to rescue it. We trust that the Copyright League will not allow themselves to be misled into trying to harmonize their views with the "protectionists." We fear that they will find themselves, if they do, in the position of dupes, and that their league will be covered with ridicule. Let "the protectionists" keep hard at work at the tariff, where they have a great field and plenty of favor. The right to own a book has nothing to do with protection or free trade.

ONE CAUSE OF EXCESSIVE LEGISLATION.

A COLLECTION of opinions as to biennial Legislatures brought out in an argument before a Massachusetts committee, has just been published. They come from impartial witnesses, and most of them from Governors of States, who have in the course of every session to pass the crop of statutes produced by their Legislatures under critical review, and who in this matter are real experts. They all go to show the same thing—and the point is one upon which there seems to be, outside of Legislatures immediately affected, no difference of opinion—that a session of a Legislature once every two years is all that any State needs. In those States which have adopted this system there is a considerable saving of money; but the most remarkable point in the evidence is that in all the reports in which the subject is specifically referred to, it appears that the actual volume of legislation has been enormously reduced by the introduction of biennial sessions, proving conclusively that the annual meeting of the Legislature is itself a marked cause of unnecessary additions to the laws. That legislation on subjects of general interest is needed in every State from time to time is, of course, not to be disputed; but the question is, How much more do we get than we actually need?—and the results of the change from biennial to annual sessions throw new light upon it. It appears, in fact, that if the Legislature meets every other year, instead of the two years' harvest of statutes being twice as large a crop as the old annual yield, it is a very much smaller one. The Secretary of State of Delaware, for instance, declares that "the amount of legislation is very much less"; in Kansas the Governor says that the change has had the effect of "greatly reducing the amount of legislation"; in Florida "the amount of legislation has been reduced fully sixty per cent."; in Alabama "the reduction of legislation is about one-half," each biennial session "doing about as much as had been done at each annual session"; in Nevada there is "a saving of at least one-half in volume of legislation."

This evidence has an important bearing on the biennial amendment now pending at Albany. It shows that it will not do for any one who opposes biennial sessions to urge that they may do well enough for small, thinly settled, half-rural States, but would never answer in great commercial communities like New York or Massachusetts, where the volume of business which legislation affects is so much larger; for it is clear that one great cause of excessive legislation is the mere fact of convening the Legislature. All our State Legislatures are made out of very much the same material; and if the Florida or the Kansas Legislature makes half the business for itself when it meets once in two years that it does if it meets every year, we may feel very confident that a biennial session at Albany would show a similar decrease.

It must have occurred to many people who have looked into the question at all closely, to ask, Why need our State Legislatures meet even once in two years? Is not once in three years often enough, or even once in four? The Governor of Texas goes so far as to predict that twenty-five years from now a session once in four years will be found quite enough. He says:

"The great advantage of the system, apart from the saving of the expense, is, that it gives time for laws to be tried before they are repealed, and also tends to prevent excessive legislation. In fact, when we get to be twenty-five years older, my opinion is that a session once in four years would be even better, as it would increase the care with which changes would be made in a system of State laws when once well established, and prevent hasty and inconsiderate legislation."

It would be rash to say how far reform ought to go in this direction. Legislatures, in any popular government, must meet at certain intervals, but the chief reasons for the original introduction of frequent sessions—jealousy and dread of the Executive and confidence in the representative body as a guardian of popular rights against it—have long ceased to exist. Nobody, for instance, in New York, dreads the Governor; everybody dreads the Legislature. In fact, so far from relying upon Major Haggerty and Mr. Husted and their like to protect us against Governor Cleveland, we rely on his veto to protect us against their work, and we elect him with a view to this, and give him a good salary and a fine house and a long term, in order that he may save us from as many of their laws as possible. Even the Legislature's power over taxes in our States, once relied upon to save the public from encroachments of the Executive, now often becomes an instrument of oppression and corruption, and nobody wants to see it in operation any oftener than possible. So that really we may say without exaggeration that most people would look forward to a total cessation of law-making at Albany for a period of four years as a sort of Utopia. Nor can there be much doubt that, with less frequent sessions, more attention would be paid to the character of the members chosen when the election came off, so that we should not only get less but better legislation. Meanwhile the immediate problem before us is how to get less; and that this will be effected by the simple device of calling the Legislature together less often, does not admit of a doubt.

EGYPT IN ENGLISH POLITICS.

THE news of Baker Pasha's defeat evidently greatly increases the Tory exasperation over the collapse of the debate on the address. This debate on the address to the Queen, in answer to her message at the opening of Parliament, is one of those annual parades which have become a settled tradition of the House of Commons, although they hardly ever serve any purpose beyond enabling one or two new members to make maiden speeches, and giving the Opposition an opportunity of freeing their minds on the state of the country generally, in the style of the Saturday debates on the state of the Union in the House of Representatives in Washington. One of the odd illustrations of the strength of such traditions in England is to be found in the fact that, although a debate on the address is always set on foot by the Opposition, and, in fact, is raised by an Opposition amendment, the Opposition considers it the duty of the Ministry to see to its being carried on for a reasonable length of time, or, in other words, to provide speakers to keep the ball rolling, even if the enemy has nothing, or appears to have nothing, to say. The collapse of the debate on Tuesday week was due to the refusal or neglect of the Ministers to discharge this somewhat ridiculous duty any longer. They apparently, in fact, declined to treat it as serious business, or to give any special attention to it, and the Conservatives, being utterly unprepared for this change of policy, had no speakers ready either; those who should have been on hand to draw attention to the rapidly approaching ruin of the country under its present rulers, being probably at dinner parties or the opera.

If the debate, however, had only been protracted for another day, Baker Pasha's defeat would have come in to give it life and animation, by supplying a very attractive Tory illustration of the wickedness and folly of the Gladstonian policy in Egypt. It would appear, however, that the Ministers are not in the smallest degree affected by what has occurred, as regards what is to be done in the Sudan. The reason of this is that the military movements in that region which they have either sanctioned or permitted, have not for their object, as many people both here and in England have supposed, the reconquest of the country, or the overthrow of the Mahdi, but the withdrawal of the garrisons along the Blue and White Nile, or, in other words, the evacuation of the whole country except a small region around Khartum. The horror of the situation in the Sudan consists in the fact that there are scattered at various points in it garrisons of

Egyptian troops, separated from Egypt proper, or from the Red Sea, by deserts over two hundred miles wide, which cannot, under the most favorable circumstances, be traversed by troops without great difficulty and the aid of a large number of camels. These garrisons the rebels have cooped up and refuse to allow to withdraw peacefully, and make no secret of their intention to massacre them if they surrender.

What Baker Pasha has been trying to do is to organize a force capable of relieving at least one of them, and striking enough terror to enable him to make terms for the rest. It is for this purpose, too, that General Gordon has been trying to get to Khartum. Neither of them is seeking to reconquer the revolted provinces, or, indeed, wants to do any fighting at all if it can be helped. The experiment which Baker was trying was whether the Egyptians could be got to face the rebels under a new and plucky commander, with a large allowance of European officers. But he has totally failed. The Egyptians will not, it appears, fight the Arabs on any terms, and will not fight even for their lives against a very inferior force—a degree of pusillanimity which we believe no race in the world has hitherto shown. Even when they know they will be killed if they surrender, they throw down their arms and submit to be butchered on their knees. One of the garrisons which Baker was trying to relieve was that of Sinkat, in which Tewfik Bey has been maintaining a hopeless resistance for some weeks. He recently tried to cut his way out to the coast, but has been surrounded and has perished with his whole force. The effect of these successes on the tribes has been so great that General Gordon will have done wonders if he reach Khartum.

All this in one way simplifies the situation for the Ministry; in another way it complicates it. It closes the mouths of those who have been denouncing them for obliging Egypt to give up the Sudan, by showing beyond peradventure that Egypt is utterly unable either to hold or reconquer it, as she has no men capable of doing either. Those who still clamor for the retention of those provinces must be prepared to impose the job on either the Indian or the British armies. As yet only a very few Jingoes have been found bold enough to propose anything of the kind. In fact, the use of European troops in that climate is out of the question.

On the other hand, the disaster will probably compel the Ministry to take some more decided attitude with regard to the government of Egypt proper. The breakdown in the Sudan has destroyed at home and abroad all hope of converting the Khedive into a respectable and strong ruler. Even the northern country papers in England are beginning to ask for a more organized and settled interference in Egyptian affairs. What shape that should take has now to be decided, and it is not easy to decide. Should the Khedive be kept up at all, even as a sham ruler? Should the Government still be a native Government under English supervision, as in some of the native States of India; or should it be direct English administration, as in the annexed provinces?—are questions which must be answered this spring, and they are very difficult.

THE FEATHER-DUSTER.

All the great modern historians teach us that one of the most important keys to a comprehension of the development of any society is a knowledge of the changes gradually introduced in its ordinary social and domestic existence. If the true history, for instance, of indoor life could be written, from its beginning in the damp, ill-furnished, and badly lighted cave of early times, down to the modern parlor, with its dry floor, abundant windows, easy chairs, and all its other appliances for comfort and convenience, we should have an epitome of human progress. The old way of writing history—that of making it a monotonous succession of kings and queens, or a dreary record of battles, murders, and sudden deaths—has been abandoned for the new method of giving a panorama of the national life. This method is now perceived to be peculiarly adapted to America, because we have no kings and queens, very rare wars, and few great commanders, and our Presidents are apt to be quite as commonplace as if they sat on a throne and wore an old-gold crown; besides which they hold office for a fixed term, while kings' and queens' reigns have always one interest, arising from the fact that no one knows certainly in advance when they will go out of office.

In the United States we may accordingly expect that the new system of writing history will meet with great favor, and that in future historians will devote themselves to giving us a picture of the life of the people, instead of confining themselves, as they used to do, to the biographies of politicians. Every newspaper tries to do this more or less from day to day, and we feel that we are only discharging a public duty in calling attention to one feature of our national life which calm and thoughtful observers have hitherto entirely overlooked. We refer to dust. The moment we pause to think of it, we see, of course, that dust is a matter of peculiar interest to Americans. The country may fairly claim to contain more dust in proportion to its population and superficial area than any in the European world. It is the only country in which during several months in the year the traveller (and all Americans are travellers) is met on his arrival at a hotel by a whisk-broom, and has difficulty in entering his name on the register, owing to the vigor with which he is dusted from head to foot, or in which the broom is again applied to him as he leaves. The curious slang use of the word in this country as an equivalent for the verb to go, to leave, to depart suddenly, as in the well-known line,

"I got up and I immediately dusted,"

cannot be overlooked. For this is not mere negro-minstrel language. It was only the other day that a cow-boy, who had occasion to adjourn a convention of cattle kings in Texas, did it by covering them with a pair of revolvers, and quietly saying, "You just get up and dust," which they immediately did. "I'll dust your clothes for you," used threateningly, is a phrase the meaning of which no one to whom it has been addressed has ever been known to mistake. That English travellers have never noticed this is all the more remarkable because England is a notoriously damp country, in which dust has had little effect on the national customs or speech. Shakspere speaks of "dusty death," as if to any Englishman the idea of dust would make death additionally disagreeable; and Ruskin's 'Ethics of the Dust' was never a popular work in England, no doubt partly because of the unfamiliarity of the topic.

The United States is, in fact, the home of dust, and we should naturally expect that it would also be the home of all sorts of inventions and appliances for protection against and removal of dust. The linen duster and the whisk-broom do undoubtedly play a most important part in hotel and railroad life. If we all lived in corridors, sleeping-cars, and hotels, there would be little cause for complaint; but, strangely enough, in the simple, familiar domestic function of dusting, we have introduced an implement which we teach or allow our servants to use in a manner that, in a dusty country, may fairly be called inexplicable.

Where the feather-duster came from originally, unless it was Africa, we do not know. The negro is fond of feathers, and in his native country applies them to their true purpose—that of display or ornamentation and parade—precisely the same use that is made of them with us by women at balls, weddings, and the opera. Stuck jauntily in the hair, they arouse among the Africans, just as they do at the Metropolitan Opera-house, the rage and envy of one, and the fancy and favor of the other race. For purposes of state they magnify the office and simple costume of the native chief. They serve in all hot countries, also, a useful purpose. By waving them gently, flies and other insects are kept from disturbing the sleep of the nabob, the boss, and the monopolist.

But neither in Africa, nor in India, nor anywhere in the world but the United States, are feathers generally used for purposes of dusting, and this is no doubt the reason why the negro, when engaged in waving the feather-duster before furniture or over bric-à-brac, is apt to show so many unmistakable signs of inward enjoyment; the thought that his white master should be so ignorant as to use feathers for such a purpose repaying the humorous fellow for centuries of servitude and wrong imposed upon others of his race. But the feather-duster in the hands of the African is not so strange a thing as the same implement in the hands of the Irish house-servant. Before the invention of the feather-duster, every American housekeeper knows that the object of the important function of dusting was considered to be the removal of dust. For this purpose, what the artists call the smooth "surfaces" were carefully wiped with a cloth, brushing being used only for such as could not be wiped. Waving was never resorted to at all. It was, too, the great object of the old-fashioned housekeeper to have as few surfaces not easily wiped as possible, and she waged for many years a brave, though losing, battle against plush, velvet, covers for mantelpieces, and inaccessible lambrequins,

solely on the ground that they could not easily be dusted. When the tide became too strong for her, and all these innovations became common, however, what we should have expected was that the art of dusting would be brought to a higher pitch of perfection. On the contrary, it was just about this time that the feather-duster gained its hold upon us as a nation, and the practice of wiping and removing the dust disappeared altogether. With a feather-duster the dust is, of course, not removed. Waving feathers at the objects on the mantelpiece or over the chairs, as the inventor, of course, knew, raises the dust, which then settles again without any diminution in quantity. Yet it is this habit of waving that we are cultivating among our servants, with the natural results among persons who neither understand nor care for the historical connection between waving and dusting. We complain of them because in waving they frequently strike and break the objects intrusted to their care. But how can we complain if servants misunderstand the use of such an implement when we cannot ourselves explain it to them? The duster, consequently, is doing a silent but awful work in unnecessarily demoralizing a class whom we pretend to feel the need of improving in every way. We can all remember a time when our houses were well dusted: it was when we had no feather-duster. Cannot its use be stopped by a heavy tax, or a statute making its employment a misdemeanor? What has it done for us to entitle it to honor or respect?

ENGLISH OPINION ON EGYPT.

LONDON, January 15.

FOREIGN troubles and entanglements are never wanting to England, even when she is ruled by a Minister more anxious than any of his predecessors to keep out of them; and among these there is none which has spread more general disquietude than the position of the British Government in Egypt, and its relations to that country. Those among the Liberals who most dislike our interference attribute it to the conduct of Lord Beaconsfield's Government when they joined in the deposition of the late Khedive Ismaïl, and, in conjunction with France, established that system of financial supervision which went by the name of the Dual Control. But the truth is that interference in Egyptian affairs is an old established part of English policy, in which every ministry has borne more or less part since the days when we drove the French out of Egypt after Napoleon's departure. For many years after that time we always had a "policy" in every part of the Turkish and Arab East; and the lower valley of the Nile became a still more important district in our eyes after the opening of the overland route to India across the Delta to Suez and thence down the Red Sea. The making of the Suez Canal increased the interest of our people there, because it now became not merely a route for passengers, but a great highway for commerce, and one used by English ships more than by those of all other nations put together. Lord Beaconsfield's Government were therefore following in the old lines when they set up the Dual Control, novel and objectionable as that arrangement was in many of its details. When Mr Gladstone came into power, and began to extricate the country from complications in other quarters, he did not attempt to retire from Egypt, and when the crisis of 1882 came upon that country in the form of the military movement headed by Arabi, the expedition which destroyed the forts at Alexandria and scattered the Egyptian army at Tell el-Kebir was the natural, almost the necessary consequence of the protecting and controlling position which England had taken up. Thirty years ago there would probably have been no compunction at, and little opposition to, such an expedition among the English people. But men's minds have greatly changed in England as regards foreign interventions. The aggressive character of the Disraeli foreign policy disgusted the mass of the people with military enterprises and annexations. England is more democratic than she then was, and both in the middle and the humbler classes there is a greater aversion to war, to annexations, to whatever bears the appearance of checking the free growth and self-guided development of any nationality. Mr. Gladstone himself is deeply penetrated by these sentiments, and it must have cost him a considerable struggle to agree to the despatch of Sir Garnet Wolseley's force.

The expedition of 1882 was due to three causes. The first was the anxiety of the mercantile interests on the subject of the Suez Canal, whose stoppage seemed to them likely to result from the success of Arabi and the anarchy which they feared would follow. The second was the existence of various treaties and engagements which bound us to Egypt, and in particular to the maintenance of the Khedive Tewfik, whom we had joined in setting up in place of his father Ismaïl. The third was the idea that the welfare of the Christians of the East generally was involved in the exertion of English influence and authority, and that our retirement from Egypt would be understood by the Mohammedan world as an abandonment of our co-religionists. Owing to these three currents of opinion, the second of which was that which mainly determined the conduct of the Executive, Egypt was occupied and Tewfik reinstated on his throne. There was, however, a significant opposition to the expedition in England itself—an opposition more important in the country than in the House of Commons, where only a small section of the more advanced Liberals voted against the grant of money for the military and naval expenses. Partly to appease this opposition, partly to disarm the jealousy of foreign Powers, and doubtless also to satisfy their own consciences, the leading members of the Ministry declared in the most emphatic manner that England went to Egypt with no purposes of selfish aggrandizement, and least of all with any views of annexation. Our mission was merely to quell a military revolt, reëstablish order, reinstate Tewfik, promote the well-being of the cruelly-oppressed Egyptian peasantry. It was announced that our troops would remain no longer than these objects required, and that our chief aim would be to create self-governing institutions under which the social and intellectual, as well as material, development of the country might peaceably advance. Nobody in England doubts that these declarations were sincere. They expressed Mr. Gladstone's long-settled views and wishes. The main object of his foreign policy has been to limit our responsibilities and the sphere of our political action, and there is no charge so often or so warmly brought against him as that of being indifferent to the glory of Great Britain and the greatness of her empire. But, however sincere in his mouth, these declarations were but coldly received. The imperialist party at home have made no secret of their desire to see Egypt annexed by us, or at least controlled under the form of a protectorate. They were therefore displeased by the announcement that after conquering the country we were going to withdraw from it, and complained that the results of Tell el-Kebir were being thrown away. The Radical party, or rather the anti-imperialist section of it, were not appeased. They doubted if it would be possible to retire, insisting that we had taught Tewfik and his ministers to lean upon us, and that the fabric we were trying to erect would crumble as soon as our military support was withdrawn. In France, Germany, and Italy our professions of disinterestedness were received with incredulity or ridicule. England is still *perfide Albion* to the ordinary French politician, whose ignorance of the forces that move English politics is inconceivable; and it was believed that we meant to hold Egypt, and were only trying to lull the suspicions of our neighbors by hypocritical words and acts, bringing back some of our troops, but keeping enough at Cairo to make our grip secure.

In the winter of 1882 Lord Dufferin, our Ambassador at Constantinople, was sent to Egypt to report on the condition of things. He drew up a plan for the establishment of a system of constitutional government, with representative institutions and local councils. It was hoped that by these means the abuses of power might be checked, and the people trained to self-government. That these hopes have been as yet little realized need excite no surprise, for such processes of training must be slow. But the inherent difficulties of our position in Egypt, as really responsible for its administration and policy, while externally and nominally nothing more than friendly advisers of its sovereign, have been brought to a head by the troubles in the Sudan. Shortly before and during the reign of Ismaïl, the authority of Egypt was extended over a vast tract along the upper waters of the Nile, a tract inhabited by black races, many of which have been converted to Mohammedanism, and in which the slave trade has long flourished. That authority was always precarious, being supported by an army small in proportion to the size of the territory, and of the worst quality. It has now, as everybody knows, been overset by the victories of one of those prophets claiming a divine commission who frequently appear in Mohammedan countries. The Khedive's Ministers, when they heard of his exploits, sent against him the force lately destroyed at El Obeid, and, after that catastrophe, proposed to make fresh efforts to reconquer the country. Here, however, their British advisers, who had not approved of the preceding expedition, stepped in and warned them not to attempt to regain the Sudan. Their resignation was followed by the installation of the present ministry of Nubar Pasha, who is understood to be acting in accord with the representative of England. We have thus been forced to assume the direction of Egyptian policy in a very important matter, just at the time when it was expected, some months ago, that our troops would be leaving the country.

Nor is this all. The defeat of the Egyptian army at El Obeid having left the country at the mercy of the Mahdi or such armed bands as ravage it on their own account, the Egyptian officials and traders, and the Europeans of all races and conditions who had quartered themselves in the Sudan, have taken refuge in Khartum, the centre of Egyptian rule, at the confluence of the Blue with the White Nile. In the presence of superior hostile forces, and separated by wide deserts from Upper Egypt and from the Red Sea, the garrison cannot long maintain itself in this position. As soon as the news of the Mahdi's victories reached Cairo, vigorous steps should have been taken either to reinforce it and win back the surrounding country, or else, if the evacuation of the whole Sudan had

been resolved on, to send such succors as would enable the garrison to reach the Red Sea coast with the non-combatants under its escort. However, the Egyptian ministry was too feeble and irresolute to do anything effective, while the English Government has hung back from committing itself either to a supersession of Egyptian authority or to warlike operations of its own. To despatch an English expedition into the heart of Africa would not only involve serious expense, but would seem like the beginning of a new policy of conquest in that quarter. If we spend men and money in reconquering territory for Egypt, or even in rescuing her troops, we shall be all the more pressed to remain on the Nile, and indemnify ourselves by retaining authority there. If our first expedition meets with a check, we shall be told that the honor of the British flag requires us to despatch larger forces and inflict a crushing defeat. And any action whatever will be contrary to the professions with which we started, that we were going to leave the Egyptians to manage their own affairs. These considerations have kept Mr. Gladstone's Ministry quiescent. But the country has grown impatient, and several of the leading organs of public opinion have kept urging them to take the matter into their own hands. They have at last so far yielded as to despatch General Gordon, well known for his exploits in China during the Tae-Ping war, and since then for his administration of the Sudan itself as the representative of the Khedive; and as he refused to go out under Egyptian orders, they have sent him as their own servant. Much anxiety is felt as to the fate of Khartum. If the fugitives there make good their escape to the coast, the present clouds may blow over. But if the people in Khartum should be cut off, that disaster would be charged on the Cabinet, not only by its enemies, but by some who are now its friends, and would damage it in the eyes both of Europe generally and of the English public. And in any case, the difficulty of either staying in Egypt or abandoning it remains. If we stay, we seem to belie our professions, we assume a considerable responsibility, we make ultimate retirement more and more difficult. If we withdraw, we leave everything to anarchy, and should be told it would have been better never to go at all. Of that part of our politicians (probably a majority) who wish to leave, there are few who think we could do so now, and not many who think we shall during the present generation. Meanwhile the Opposition are well pleased, because they not only count on seeing the Ministry discredited by the disappointment of its hopes for retiring from Egypt, but they reserve to themselves, when they next come into power, the pleasure of taking the more decided course of assuming a permanent protectorate, which will easily slide into annexation. Y.

VATEL AND THE PLEIAD.

PARIS, January 17, 1884.

THERE are two societies of bibliophilists in Paris. One, the old and renowned Société des Bibliophiles Français, is composed of the greatest amateurs—such men as the Duc d'Aumale, M. de Lignerolles (who has one of the finest collections of books known), Baron Pichon, the President of the Society, who has spent a life in making collections of all kinds, M. de la Béraudière, Baron de Lacarelle, the Duc de la Trémoille, etc. There is a younger society, called the Société des Amis des Livres, which has only been in existence for a few years, much more modest in its aspirations and particularly devoted to modern literature. The Amis des Livres leave to the Bibliophiles the old Aldine editions, the incunabula, the monuments of the fifteenth and the sixteenth centuries, even the serious works of the seventeenth century. Most of its members have only collected the charming editions of the eighteenth century, illustrated by Eisen, Cochin, Moreau le Jeune, Gravelot; and they are now collecting the original editions of the "Romantics" of the nineteenth century. They have issued some editions of the Romantics, which are already very much sought after. The 'Chronicle of the Time of Charles IX.,' by Prosper Mérimée, Mürger's 'Vie de Bohême,' 'Fortunio,' by Théophile Gautier, Victor Hugo's 'Orientales,' Balzac's 'Eugénie Grandet.' These editions are illustrated by the best artists of the present time; the Amis des Livres are and profess to remain very modern.

The Bibliophiles also make publications from time to time, but these have quite a different character. I have before me 'La Suite des Œuvres poétiques de Vatel,' reproduced in facsimile from the original manuscript under the auspices of the Society of French Bibliophiles. The work is truly magnificent; but who is this Vatel, and what is the history of this precious manuscript? We read in the Catalogue of the Library of the Duc de la Vallière (1784), one of the largest and finest libraries formed in France during the last century: "No. 3283. La Suite des Œuvres poétiques de Vatel," 8vo, etc., a manuscript enriched with drawings and ornaments painted with the greatest care in *encre de Chine*, and dedicated to M. de Villeroy, Secretary of State. This manuscript was sold for eighty francs at the La Vallière sale, and we find it afterward in the catalogue of the famous bookseller, Renouard, in 1819. The book was bought by M. Cigogne, a stockbroker, a man of consummate taste and knowledge, who, it can be truly said, never bought an indifferent book in his life. He wrote on the margin of his catalogue: "The drawings are in very good taste; they are attributed to Étienne Delaulne." All amateurs of art know Delaulne and his wonderful little albums of ornaments: he is considered one of the most admirable in this line.

Let us now see who is Vatel. The Duc d'Aumale has written a notice of him as an introduction to the facsimile of the manuscript, which is now in his possession, as he was fortunate enough, at the death of M. Cigogne, to buy his complete library from his heirs. Vatel lived at the time of what we call the Pleiad; he was one of the smallest luminaries of the poetical constellation of the sixteenth century. The fortune of the writers of the Pleiad is somewhat singular: they are alternatively praised or forgotten. At times it would seem as if they were the only fountains of French poetry, and as if all inspiration had died with them: they alone possess imagination, they alone have the divine afflatus; their language is the true French language. After a while comes a reaction, and these same poets are pronounced monotonous, dry, affected: their language is obscure, their horizon is limited; and, with the exception of a few pieces, nothing in their immense work is worth remembering. During these reactions, everybody is ready to say with Boileau, "Enfin, Malherbe vint." Victor Hugo and the Romantics made a violent attack on Boileau and the Classics, and whoever reads Ronsard will easily see how much Hugo has borrowed from him in his poetical work. During the reign of Louis Philippe there was a classic reaction, headed by Ponsard, the author of a tragedy called "Lucrèce," and by Émile Augier, who is still alive. This reaction was not quite vain, as it was helped by such men as Nisard, Villemain, Cousin.

A few years ago, the forgotten poets of the Pleiad came up again, under the influence of the school which we call the Parnassians, or the stylists—poets who care more for fine words than for ideas—Leconte de Lisle, Théodore de Banville, and a few others. There is hardly a month when Lemerre, the enthusiastic publisher of the new Parnassus, does not publish a volume of poems written for the happy few who delight in *rich* rhymes, and in curious rhythms, and in the mere play of words. The dramatic and lyrical sterility of the new school contrasts curiously with its extreme ability in the mere process of versification. The fact is, that they profess to disdain emotions, passions, as something low, vulgar; they live in the azure, among the stars; they have taken for their models the poets of the Pleiad of the sixteenth century, who were literary jewellers, if I may so express myself.

Vatel is not mentioned in Desportes, nor in Ronsard; only in Baïf do we find a mention of him. Baïf was one of the most charming of the poets of his time; some of his poems can take rank with the best of Ronsard's and Marot's. He thought well enough of Vatel to address him a piece, which is an invective against a person who had dared to insult a "holy poet." He first calls for Du Bellay, Desportes, Ronsard, and then says:

"O Vatel, ce n'est pas l'injure
Qu'on dit de bouche et qui ne dure
Qu'autant que l'homme est survivant.
. . . . .
Mais, amy, veux-tu bien qu'il meure
Sans éprouver la playe seure
De tes iambes enflammez,
Qui, poussez de voix furieuse
Contre la beste injurieuse,
Vengeront tes amis blasmez?"

Vatel, as we see here, was a writer of iambics, a satirist, a "redresseur de torts." He was also a royalist, like Ronsard, like Baïf—an ardent royalist, like all the poets of the Pleiad. They had no strong religious passions, but they took sides with the King against the Huguenots. The denunciations of the Huguenots by Ronsard are well known. Vatel also deplores the civil wars; he would like to live quietly at Blois, his native town, on his beloved Loire. We learn his history in his poems. His father was a lawyer. He received a good classical education, but he seems to regret not having walked quietly in the footsteps of his father. He was robbed of the paternal acres by some wicked relations, and he tried in vain to get them out of their hands. "The children of Apollo," he says, "are always unhappy." All goes wrong with him. All women are cruel; he is constantly crossed in love. He sends his verses, with the hope of a pension, to the King; to the Duc d'Anjou, the King's brother; even to the secretaries of the King, to his valets, to the financiers of Paris or of the provinces. His efforts were vain. His best friend seems to have been a Swede called Holster, a scientific man and a philosopher, who had, for some reason unknown, fixed his residence in France. Vatel addresses some of his verses to this unknown protector. He addresses, also, some sonnets to a M. de Pesloë, who must have been a person of some importance, as there is a geography of the time dedicated to him.

All the events of which we find traces in the poetical work of Vatel which is now published, are placed between 1569 and the end of 1573. There are allusions to a young Count of Brissac, who was killed during that period; to the death of Claude l'Aubespine; to the marriage of Charles IX. and of Elizabeth of Austria; to the massacre of Saint Bartholomew; to the taking of Santerre. Vatel, like most poets, was a mere echo of the dominant passions of his time, and we find nothing characteristic in his work. His hero was Sebastian of Luxembourg, Viscount of Martigues and Duke of Penthièvre, Colonel-General of the French infantry, and one of the best soldiers of his time, who fought

at the siege of Leith, in Scotland (1560), at the famous battle of Dreux, and in a hundred other places. Vatel addressed to him his best poem. One sonnet is dedicated to "Monsieur le Gast," the great friend of Brantôme, who calls him Du Gua, a great courtier and favorite of the ladies—almost a *mignon;* a brave soldier, who could also write poetry; a friend of Baïf and Ronsard. Du Gua was murdered in his bed on the 1st of November, 1575, by the Baron de Vitteaux, also a friend of Brantôme. We find, also, among the persons to whom Vatel addresses his poems, young Timoléon de Cossé, Count of Brissac, who commanded at the age of seventeen the "bandes" of Piedmont. His father, old Marshal Brissac, who had so long had command of the French troops in Italy, had given to his son the name of a hero of Plutarch, and chosen for his preceptor a Scotchman, the well-known Buchanan. There was nothing puritanic in young Timoléon. He was handsome, fond of masquerades and dances; he once danced before the King, to the sound of the lute of Strozzi. Fancy the two old soldiers, Strozzi and Brissac, and this young man, "ayant le menton à peine jauni d'une soie dorée," Vatel. We find, also, a mention in the poems of a relation of Brissac, Artus de Cossé, well known in French history under the name of Gonnor, which is constantly found in the voluminous correspondence of Catherine de Médicis. Gonnor was one of the confidential advisers of the Queen; he was among those who were called the "politiques."

The manuscript itself, ornamented by Delaulne, written with much care, is addressed to the famous Villeroy, who was Minister of four French Kings, and Councillor of Catherine de Médicis as well as of Henri IV. His name belongs to French history. He was a diplomat of the highest eminence, and during the most troubled days of the wars of religion he never lost sight of the permanent interests of his country. He had probably rendered some service to poor Vatel, or Vatel expected to find in him a Mæcenas; for, even in the sixteenth century, it must have been an expense to make and bind magnificently a large manuscript, and to have it adorned with beautiful miniatures. The facsimile, now published, will some day be looked upon as a great curiosity, as but a few copies have been printed. Delaulne's miniatures have been marvellously imitated; the introduction by the Duc d'Aumale is a facsimile of his own hand-writing.

Correspondence.

THE PRICE OF BOARD.

To the Editor of The Nation:

Sir: I am always interested in the articles on the "State of Trade," finances, prices, etc., though, being a woman, perhaps I do not understand them all. Is it too much to ask you to explain in the *Nation* why it is that, in a time of general depression and low prices of many things, the price of board is so high (higher here than two years ago); and why it costs a woman so much more to live than formerly? To say that women dress more extravagantly does not answer the question, for the price of work is higher, and many articles of a woman's dress (most of them I think) remain at the old high rates, provided a good quality is bought.

While I do not suppose that you wish to take up the rôle of adviser, is it yet possible to give any information as to whether there is any safe way of investing small savings other than in the savings banks?

Can you give any account of the Coöperative Loan and Building Associations, such as profess to succeed in Philadelphia, and which apparently enable one to invest small sums of money?—Respectfully,

Emma G. Shaw.

Boston, February 7, 1884.

[If it be true that the price of board is as high in times of general depression like the present, when the prices of commodities at wholesale are confessedly lower than the average, the reason must lie in the fact often adverted to by economists and statisticians, that retail prices do not fall *pari passu* with wholesale. In other words, the butcher and baker and candlestick-maker charge as much in times of depression as in other times. They do not come down until they are forced down. In this respect they act in accordance with a law common to all other traders, of charging all they can get. The force of competition will bring them down eventually, but the force of habit enables them to maintain prices for a time at a higher level than the wholesale markets justify.

We cannot undertake to give advice regarding the investment of money in either large or small sums.—Ed. Nation.]

THE UNITED STATES SINKING FUND.

To the Editor of The Nation:

Sir: There are, constructively, in the United States Sinking Fund, bonds amounting to over $438,000,000. Of these, about three-fourths appear to be computed as bearing still 6 per cent. interest. Have we not a right to demand that these be "continued" at 3 per cent.? If it is unwise, as many of us believe, to pay off the public debt by the present burdensome taxation so rapidly as we are doing, then any honorable mode of reducing the demands of the Sinking Fund is permissible.—Yours truly, N.

Yale College, New Haven, Conn., February 2, 1884.

[The requirements of the Sinking-Fund Act having been largely exceeded in times past by the bond redemptions of the Treasury, it is permissible to lessen the amount applicable to the payment of the public debt in a variety of ways. "Continuing" the 6 per cent. bonds in the fund at 3 per cent. would, however, be of no avail as a means of lessening the rate of speed, if the Government's income is not shortened, since whatever sum is saved in the way of interest payments accumulates in the Treasury, and can only be released by the redemption of bonds. There are many considerations which point to the desirableness of a less rapid reduction of the debt, but this is not so great an evil that one need lie awake nights thinking of it. There are many rocks ahead more disturbing to a patriot's vision than entire freedom from public debt.—Ed. Nation.]

THE NATIONAL BANK CIRCULATION.

To the Editor of The Nation:

Sir: May one who is but imperfectly informed on financial subjects ask of you a question or two?

The present circulation of the national banks is, as I understand it, based on money lent to the United States Treasury, and its redemption is secured by the deposit with the Treasury of the bonds—that is, of the evidences of that loan. As this loan is repaid to the lenders, the bonds, of course, are cancelled. Why cannot the banks, as the loan is paid off, deposit the specie with the Treasury as a security for their circulation, just as now they deposit the bonds? and what is the objection to their doing so?

Interest I have always understood to be a compensation paid for the use of another man's capital, and most justly paid (*pace* Mr. Ruskin), since the owner waives the profit he might make by using it himself. So that those who lent money to the Treasury during the war were justly entitled to interest upon the loan until reimbursed, because they had withdrawn that money from other profitable uses. But I fail to see how those who use their capital in banking business can also claim interest on it as a loan, be the interest 10, 6, or 1 per cent.; and I most decidedly object to being compelled, with the rest of the public, to pay interest on capital whose owners are at the same time making profit from it. This may be a solution of the problem hitherto deemed insoluble—how to eat your cake and have your cake; but I prefer that it should not be solved at my expense. B.

THE INCOME TAX.

To the Editor of The Nation:

Sir: Your editorial, in your issue of the 31st ult., under the title "State Taxation," discusses a problem that has sorely vexed the tax-gatherers of probably all the States and municipalities in this country, viz.: how to secure a full and complete return of taxable personal property. Your criticism upon the imposition of an income tax as a remedy for the existing evil in that regard seems to me unanswerable, if we do not go deeper into the subject for the purpose of discovering the real cause of failure of the direct tax upon personal property.

There will, of course, always be a number of taxpayers who will, even under oath, make false returns of their personal property or of their income, whatever may be the justice of the system of taxation in vogue; but this perversity of human nature will not account for the alarming extent to which false returns are now made. The real cause for this widespread evil is the inequity of the present system of taxation. It is, I believe, universally the rule, and in some of the States expressly required by their Constitutions, to tax real and personal property at the same rate per cent. on the market or assessed value. This works an injustice to holders of personal property. The average rental of real property yields 10 per cent. gross, while ordinary securities, if they have any fixed income, rarely exceed 6 per cent., and are at present oftener 4 or 5 per cent. The State, county, and city taxes rarely fall below 3 per cent. That would leave but 1 to 3 per cent. income on personal property, while on the real estate 7 per cent. would be left, with only the cost of repairs and insurance, usually not more than 1½ per cent., to be deducted therefrom, in order to ascertain the net income.

If provision were made by the law for this difference in the income usually derived from these two kinds of property—*i. e.*, make the percentage of tax vary with real and personal property in the proportion that the average incomes from them bear to each other—it matters not whether you lay the tax upon the income or directly upon the value of the property, the amount of personal property returned for taxation would be at once materially increased. If, under the present system, a taxpayer returned all his taxable personal property, they would be

ruinous investments and become a drug upon the market.—Yours respectfully,

C. G. TIEDEMAN.

LAW DEPARTMENT, UNIVERSITY OF THE STATE OF MISSOURI, COLUMBIA, MO., Feb. 5, 1884.

Notes.

A. C. ARMSTRONG & SON will shortly publish 'The Principles of Written Discourse,' by Prof. T. W. Hunt, of Princeton College.

The Webster Historical Society, of Boston, announce for immediate publication a pamphlet edition of Judge Chamberlain's address upon John Adams, delivered before that body at its annual meeting on January 18.

Cupples, Upham & Co., Boston, have in press 'Boating Trips on New England Rivers,' by H. Parker Fellows.

The *Library* of Cornell University for January contains a list of the periodicals in the May Anti-Slavery Collection, which is worth the attention of students on the one hand, and on the other of persons having odd copies of the magazines and newspapers on the list, and who would like to assist in supplying the deficiencies of the collection.

A 'Guide to the Civil Service of the United States,' by John M. Comstock, Chairman of the Board of Examiners for Customs, New York; and a 'Cyclopædia of German Poetry, Ballad and Lyrical,' edited by Karl Knortz, with German text and choice translations, will be published by Henry Holt & Co.

Porter & Coates, Philadelphia, have in press 'Luther and the Reformation,' by Dr. Seiss; 'Amateur Photography,' by Ellerslie Wallace, jr.; and a 'True History of the Charge of the 8th Pennsylvania Cavalry at Chancellorsville,' by P. Huey.

Mr. P. S. P. Conner, 126 South Eighteenth Street, Philadelphia, is collecting the correspondence of his father, the late Commodore Conner, and will be glad of the loan of letters from or to the latter, as well as to be furnished with any anecdotes or reminiscences concerning him. Mr. Conner's object is perhaps a life of the Commodore, whose inaction during the Mexican war, it will be remembered, was recently censured by Captain Parker in his 'Recollections of a Naval Officer.'

The Leonard Scott Publishing Company, No. 1104 Walnut Street, Philadelphia, state that they have had "transferred" to them the proposed reissue of the *Contemporary*, the *Nineteenth Century*, and the *Fortnightly* Reviews, which the "English Publishing Company" advertised; and in token of it we have received the January *Fortnightly* in its new dress. Whether the recent protest of Messrs. Kegan, Paul, Trench & Co. against the English Publishing Company's undertaking holds good here also, we cannot say.

To their Parchment Paper series D. Appleton & Co. have just added 'Pictures of English Society,' some forty copies of Du Maurier's drawings in *Punch*, reduced by "process." A slight sketch of the artist, based on Mr. James's article in the *Century* last May, is prefixed. The letter-press is printed on the page opposite the cuts, and the whole effect is very pretty. There is a certain loss in color from the reduction, as well as of expression in the faces, though in the latter particular the defect is more trifling than might have been expected. Perhaps the worst instance is in "Beauty a Critic on Beauty," where the scale prevents the point from being seen instantly.

Harper & Bros. have issued Mr. G. W. Curtis's oration at the unveiling of Ward's Washington on November 26, in a handsome pamphlet. A heliotype view of the statue is given as a frontispiece.

In Mr. Foster's *Monthly Reference Lists* for January, the single topic is "Classical Studies and Scientific Studies," to which four pages are devoted. The summary view is made extremely valuable by its chronological arrangement, the earliest date being 1833, when George Combe was lecturing in Edinburgh on popular education.

"The Metrological System of the Great Pyramid," with which Prof. Piazzi Smyth's name is most prominently associated, is ruthlessly exposed by President Barnard in the *School of Mines Quarterly* for January. We can recommend his paper (which is but begun in the present number) as very entertaining reading.

Union and Confederate Annals is the title of a monthly magazine issued last month from the Valley Bookstore, 308 N. Sixth Street, St. Louis. It will consist of "facts and incidents of the late war in the Southern States, from Union and Confederate sources, recited in a fraternal spirit." There is also a "Mexican War Department," and one for "The Texas and Other Wars." Useful is the record of Reunions and Fraternities, and the list of Army and Historical Societies. Book reviews further add to the variety of the contents, but are too brief and perfunctory to be worth much except as advertisements.

Any one desirous to assist in determining the true status of the European house-sparrow (*Passer domesticus*) in this country, "in so far as the relations of this bird to mankind are concerned," will do well to apply for blanks lately issued by the American Ornithologists' Union. These contain twenty-seven questions touching the habits, diet, and general reputation for good or evil of the little stranger, and may be had of and returned to Dr. J. B. Holder, at the American Museum of Natural History in Central Park.

The Third Annual Report of the United States Geological Survey, submitted by Director J. W. Powell to the Secretary of the Interior, has been recently issued from the Government Printing Office at Washington. It covers the operations of the Survey for the year ending June 30, 1882. It is a large volume of 564 pages, including what appears to be a very full index. It is illustrated by 67 plates and 56 woodcuts. Of the former, 32 are devoted wholly to palæontological figures (fossil mollusca). The volume contains a brief introduction and financial statement by Director Powell, followed by short administrative reports of nine heads of divisions, giving an account of progress in their respective departments. The principal communications of a scientific nature comprise one by Professor O. C. Marsh on "Birds with Teeth," another by Roland D. Irving on "The Copper-Bearing Rocks of Lake Superior"; a "Sketch of the Geological History of Lake Lahontan," by Israel C. Russell; "Abstract of the Report upon the Geology of the Eureka District, Nevada," by Arnold Hague; "Preliminary Paper on the Terminal Moraine of the Second Glacial Epoch," by Thomas C. Chamberlin; and "A Review of the Non-Marine Fossil Mollusca of North America," by C. A. White, M.D.

Mr. Arnold Hague has caused to be issued in a separate cover, for distribution among those especially interested in the subject, his 'Abstract of the Report upon the Geology of the Eureka District, Nevada,' mentioned in the foregoing note as forming part of Director Powell's volume. This publication includes two plates, one presenting a handsomely executed geological map, the other showing geological cross-sections of the Eureka District. This district is one of great economical interest as it has long been one of the most important mining centres of the West, and, since the decline of mining activity on the Comstock Lode, is probably at present the most successful mining region in the State of Nevada. Within the last fifteen years it has been the source of about $50,000,000 in gold, silver, and lead. It is, moreover, of special interest from a scientific point of view, since the region consists largely, almost wholly, of sedimentary rocks, and affords to the geologists an exceptional opportunity for the study of the lower and middle Palæozoic formations, developed upon a grand scale and presenting some intricate and interesting problems in mountain structure. Mr. Hague's study of the district is purely geological in its scope. The forthcoming report, of which the paper now presented is an abstract, will consist of a volume of text, devoted to a description and discussion of the geology of the region, and an illustrative atlas of topographical and geological maps and cross-sections. Two special monographs, amply illustrated, will accompany the report, one by Mr. Charles D. Walcott, upon the palæontology of the Eureka District, and the other by Mr. Joseph P. Iddings, upon the microscopic petrography of the eruptive rocks of the region. The whole work of Mr. Hague and his assistants, as forecast in the abstract, promises to be a very important contribution to geological knowledge, especially of the Palæozoic formations of the West.

—The London *Publishers' Circular* for December 31, 1883, according to its annual custom, gives an analytical table of the books published during the last twelve months. From this table it is seen that the new issues of 1883 exceeded those of 1882 by 754 volumes. Of the total number (4,732), 704, or more than one-sixth, are works on theology; 741, also more than one-sixth, are juvenile literature. 556, more than one-eighth, are classified as educational books, including classical texts and philological works; 414, or more than one-eleventh, as history and biography; 354, one-thirteenth, as books on the arts and sciences, and illustrated works; and 256, or one-eighteenth, as belles-lettres, essays, and monographs. The most interesting feature of this report, however, seems to be the fact that by far the largest increase is in the department of belles-lettres, where the number rose from 92 in 1882 to 256 in 1883. In educational literature there was also an increase from 455 in 1882 to 556 in 1883, and in theological works from 596 to 704. In books on the arts and sciences, and illustrated works, there was an increase of 90; in law and jurisprudence, of 87; and in history and biography, of 53. The increase in the issue of novels is limited to 43, while in poetry and the drama there has been a falling off from 156 in 1882 to 145 in 1883. The general total of new editions has advanced from 1,146 in 1882 to 1,413 in 1883, an increase of 267. Of this increase, 105, nearly one-half, falls under the head of novels. It seems to have been a better year for old novels than for new ones. The influence of the holiday trade is shown in the fact that the number of books published in December is nearly double the number published in any other month except November. While the average number of issues per month was 512, the number published in December was 1,028, and the number in January 207. A survey of the year as a whole, from the bookmaker's point of view, would seem to justify the statement of the *Circular* that "there has been a progressive movement in trade circles during the year, and that a demand for actual novelty in literature is making itself felt."

—According to the last report of the librarian of the Cincinnati Public Library, the number

of volumes and pamphlets was 149,750, and of volumes alone 134,587. Of the $5,371.68 spent for books and pamphlets, only $469.15 were spent for novels. The library has not attempted for some years to maintain the supply of fiction duplicates, and to this fact, and partly to outside resources in the way of cheap literature, is owing the decrease in the percentage of fiction, which fell from 64.1 to 62.6 in the two preceding years, and for 1882–3 was 60.2. But the librarian is encouraged further by the fact that the non-fiction works require much more time to read them than the ordinary reader gives to his novel, so that the usual statistics by no means show the amount of thought or the literary activity required by the different classes of books. In the large efforts now made to increase the use of libraries, especially among the children in the schools, the Cincinnati Library was obliged during the last year to take a step apparently backward. The Board of Managers was informed that many young people, under pretext of visiting the library in the evening, went out for other purposes; and to prevent such excuse after 9 o'clock, the library was closed at that hour from October 1, 1882, to June 30, 1883. A former generation would have thought 9 o'clock late enough for their young people, and the ordinary schoolboy would probably get all the advantage from the library by that hour that would be possible for him. But another class—whether productive literary workers or not is perhaps doubtful—would be dissatisfied with the restriction, as the Cincinnati Library appeals to a much larger public than most others, and was formerly open till 10 o'clock in all the departments excepting the art and the cataloguing room; the main hall having been kept open for the issue and reading of books, as well as the newspaper and periodical rooms.

—To those admirers of Mr. John Morley who have not been able to escape regret that he should have quitted the stronghold of the independent scholar for the tricks and turbulence of the political arena, his essay on Emerson prefixed to Macmillan's edition will bring some welcome reassurance. The great merit of Emerson is still affirmed to be that he is "the friend of those who live in the spirit"—which, of course, except in the mere phrasing of it, is not an opinion original with Mr. Arnold—that his "mission lay in calming men rather than in rousing them, and in the inculcation of serenity rather than the spread of excitement"; but Mr. Morley gives a clearer explanation of the sources of this teaching in Emerson's own thought, and the historic cause and need of it in American life:

"All thoughts are always ready, potentially if not actually. Each age selects and assimilates the philosophy that is most apt for its wants. Institutions needed regeneration in France [in the eighteenth century], and so those thinkers came into vogue and power who laid most stress on the efficacy of good institutions. In Emerson's America, the fortunes of the country made external circumstances safe for a man, and his chance was assured; so a philosophy was welcomed which turned the individual inward upon himself, and taught him to consider his own character and spiritual faculty as something more than anything external could ever be."

And a most suggestive parallel between Ruskin's explanation of the fact that semi-civilized nations are better colorists than ourselves, and Rousseau's plea for "sweet and precious ignorance," is drawn to show the harmony of this Emersonian doctrine with the philosophy of democracy.

—The essay contains a number of striking sentences, and is far from "overlaying a pithy text with a windy sermon," as Mr. Morley says at the outset such introductions are apt to do. For instance: "The worldly and the selfish are mistaken when they assume that Common Sense is their special and exclusive portion. The small Transcendentalist goes in search of truth with the meshes of his net so large that he takes no fish. His landscapes are all horizon. It is only the great idealists, like Emerson, who take care not to miss the real." "With him, small circumstances are the occasion of great qualities." His poems are "too naked, unrelated, and cosmic; too little clad with the vesture of human associations." The essay is remarkably appreciative, but it is discriminating as well, and Mr. Morley deals severely with some of Emerson's "fair-weather" transcendentalisms: "What can be more idle, when one of the world's bitter puzzles is pressed on the teacher, than that he should betake himself to an altitude whence it is not visible, and then declare that it is not only invisible, but non-existent?" And again: "But what would those two divinities of his, Plato and Socrates, have said of a man who 'could not give an account of himself if challenged'? Assuredly not every one who saith 'Plato, Plato,' is admitted to that ideal kingdom."

—Several journals, notably the *Literary World*, have been entertaining their readers of late with charges of plagiarism brought against various authors, with parallel columns of the imitator and the imitatee, if we may be permitted to coin a word, and with letters from eager correspondents arguing very justly that similarity of story, similarity of ideas, and even similarity of expression are not inconsistent with entire originality. Among the authors inculpated was Mrs. S. G. C. Middlemore, who had been so unfortunate as to hear her Spanish stories told by the peasants in almost the very same words in which Becquer heard them related by his peasants: who had, moreover, remembered them as faithfully as he had and reproduced them as exactly; but had never—she says so herself, so that it must be true—read his book till after hers was written. It was the *Athenæum* that first detected the—coincidence, published the usual parallel columns, received her defence, and in a way withdrew the charges. There was also the likeness of the story of Charles Reade's 'Born to Good Luck' and one of Grimm's Märchen; and of Oliphant's 'Altiora Peto' and Charles Barnard's unpublished "La belle Américaine"; and, most curious of all, the three pages of instances of "Classic Plagiarism" in the *Literary World* of Aug. 11, which Mr. John Bartlett wrote to that journal to say could all be found in his 'Familiar Quotations,' implying that the unveiler of plagiarisms had appropriately plagiarized the instances which he gave of the fault. These little accidents are not confined to English-writing authors. Last August the *Bulletin Critique* contained an amusing review, by Father A. Ingold, author of the "Essai de bibliographie oratorienne," of Monseigneur Ricard's 'Les premiers Jansénistes et Port-Royal.' The learned Oratorian declared that of the second part, relating to Port Royal, nine chapters out of fifteen were copied almost literally from the 'Port-Royal' of Sainte-Beuve, the 'Histoire de Louis XIV.' of Gaillardin, or the 'Jansénistes du 17e siècle' of the Abbé Fuzet, and that the other six chapters were in large part conveyed from the same sources. Mgr. Ricard had indeed changed *horizon restreint* into *horizons étroits, illustre* into *célèbre, Église catholique romaine* into *catholicisme, assourdissant* into *étourdissant*, and so on; but otherwise the sentences are word for word the same. Why he took the trouble to make these changes is not evident, except in one of the cases cited, where his motive is plain enough. Sainte-Beuve had said that "plusieurs des jeunes filles qui devinrent les principales religieuses de Port-Royal" had had the smallpox, which spoiled their faces. Mgr. Ricard, eager to cast a slur on the Port-Royalists, makes this "la plupart, pour ne pas dire toutes," and in the summary of the chapter simply says "toutes marquées de la petite vérole." If he were willing to use the plea, Mgr. Ricard no doubt could urge that his plagiarism was well for the public, giving them much better matter for their money than they would have had if he had depended upon his own resources. Sainte-Beuve's work is excellent reading and not bad history, whereas, if one can judge by three passages discussed at some length by Father Ingold, either Mgr. Ricard's ideas of the laws of evidence are very hazy, or his love of historical truth is on a par with his regard for the rights of literary property.

—Mgr. Ricard is a prelate attached to the household of the Pope, and a popular author of works of devotion. His 'Mois des Étrennes spirituelles,' 'Mois des Pèlerins,' 'Mois des Bergers,' and other 'Mois sanctifiés par la prière'; his 'Matinées de l'âme pieuse,' his 'Manuel de la jeune personne,' and the two periodicals which he edits, the *Semaine Religieuse* and the *Propagateur de la Dévotion à Saint-Joseph*, no doubt breathe a most edifying spirit, and have consoled thousands of souls, for whose sake it would not do to leave Father Ingold's attack unanswered. A periodical which he has just founded, the *Annales de Provence*, gave him a place in which to reply; the only difficulty was to find anything to say. He had not Mrs. Middlemore's defence of a common popular origin; he could not allege unconscious memory (for nine chapters) nor the other excuse—great minds engaged upon the same subject and thinking alike; people do not think in the same words for hundreds of pages. Nor could he deny the similarity, for the books were before the public to compare. However, he hit upon a formula which is quite as good as many of the excuses that convince everybody at a spiritualist séance, and so no doubt will serve with his audience. He attacks the *Bulletin Critique* as belonging to the Liberal Catholic school, and warns the public to "regard with suspicion its passionate verdicts, which are often unjust toward writers who profess a full and entire submission to the Council of the Vatican."

—In seven numbers of last year's *Athenæum* (May 5–August 25), Dr. Friedrich Delitzsch, Professor of Assyriology in the University of Leipzig, published a series of articles on "The Importance of Assyriology to Hebrew Lexicography." To many an English reader interested in Old-Testament studies, but unacquainted with the philological results of Assyriological inquiry, these popularly-written, though very learned, essays must have been a revelation. The author, however, was evidently less intent on popularizing cuneiform discoveries than on advocating in a new arena the claims of his science to be considered a most (if not *the* most) helpful instrument for establishing the true meaning of obscure Hebraic roots and stems. He has now reissued the series, in a revised and augmented form, in the shape of a small volume, entitled 'The Hebrew Language, viewed in the Light of Assyrian Research' (London: Williams & Norgate). This English publication of the younger Delitzsch is remarkable for all the good qualities which characterize his writings in German, one of the most important of which, 'Wo lag das Paradies?' we lately introduced to our readers (No. 924 of the *Nation*) in an extensive review.

Professor Delitzsch pleads for Assyrian as the best guide in Hebrew etymology, and his plea, supported by a vast amount of evidence lucidly presented, is mainly directed against the still prevalent Arabizing school of lexicographers. As the chief and latest exponent of this school, which relies almost exclusively on the immense stores of the Arabic vocabulary for the explanation of everything uncertain in the kindred tongue of the Hebrews, he selects the Dictionary of Gesenius, as presented to students by Professors Mühlau and Volck, in the eighth and ninth editions (1878 and 1883). Though mainly limiting his censure "to cases where the editors have erroneously deviated from the correct views of Gesenius, or have failed to recognize what Fürst and Levy had already anticipated," he attacks the whole old system, believing that "it is time to abandon the ordinary practice of forcing the peculiar, often late, meanings of the Arabic words upon the much older Hebrew sister." His wider aim is, in fact, to attempt a total reformation of the Hebrew dictionary by means of Assyrian; but he is not yet decided whether he should begin it by "Prolegomena to a new Hebrew dictionary," or publish at once his own Hebrew dictionary, compiled along with his Assyrian dictionary. Even as stated in this form, this announcement is important.

—It is an easy matter for Professor Delitzsch to point out absurdities into which Hebrew lexicographers have fallen, from a presumed necessity of explaining everything and the presumed possession of a general key in Arabic. Such is the explanation of a Hebrew verb meaning *to lie* by an Arabic one meaning *to be red*—"*i. e.*, to redden, to paint red, to varnish the truth, *i. e.*, to lie," or of a verb meaning *to join* by one meaning *to break*, "because joining as well as breaking may be effected by striking one object against the other." Hardly less strange is the explanation of the Hebrew verb *kāmar* and its derivatives in the last edition of Gesenius's dictionary, which "gives three different meanings to this one root: firstly, 'to hide,' by which *mikhmereth*, 'net,' is explained as the object hidden in the water or on the earth; secondly, 'to be dark or black,' by which *komer*, 'priest,' is interpreted to mean originally 'blackness,' then the 'dark-dressed man' . . .; thirdly, 'to contract,' therefore, Gen. xliii. 30, 'His bowels were drawn together towards his brother.'" Still more justly does Professor Delitzsch ridicule the conjunction of the Hebrew word designating the Pleiads with an Arabic verb signifying *to have a large hump* and its derivative meaning, *a heap*. "Those seven stars, which are compared by Persian poets with a necklace or a bouquet of jewels, could hardly be compared with a heap of earth." But we are afraid he is himself not sufficiently guarded against the temptation to explain too much and explain too consistently through a favorite medium, which has proved so dangerous to etymologists in all linguistic fields—as when, in explaining *kāmar* and its derivatives with the help of the cuneiform inscriptions, he reaches the conclusion that "the passage in Sam. v. 10 is . . . to be translated 'Our skin *has been overpowered* like an oven,' *i. e.*, has become powerless, or lost its vigor and power of resistance 'by the burning of the famine.'" Nor is his Assyrian explanation of Heb. *ēm*, mother, much sounder—though certainly less preposterous—than the Arabizing one which he derides. The Hebrew word for mother stands in the same relation to *mamma* (*ma*), Lat. *mater*, Ger. *Mama* and *Amme*, Russ. *mat'*, Pol. *matka* and *mamka*, Hun. *anya*, and a multitude of similar primitive words signifying *mother* or *nurse*, in all kinds of languages, in which the Hebrew word for father, *āb*, stands to *papa* (*pa*), Lat. *pater* and *avus*, Hun. *apa*, etc., etc.

—The Germans, who used to write in terms of almost querulous admiration about the sumptuousness of English philological works, have left everybody behind—at least every philological periodical behind—in the first number of the *Internationale Zeitschrift für allgemeine Sprachwissenschaft*, edited by Dr. Techmer (Leipzig: Barth; New York: Westermann). It is almost too fine for use, like Egmont when he appears in gala-dress to Clärchen. There is absolutely no fault to be found with quality and tone of paper; type and press-work are both admirable. To American eyes, however, the page is too broad. Almost all German scholars are near-sighted, and, to a man who has to put his nose within an inch of the paper, it matters not how broad a page is; but to the normal American eye the succession of long lines is fatiguing. The frontispiece represents the statue of Wilhelm von Humboldt, erected last May in front of the Berlin University, and each number is to be adorned by the likeness of some eminent philologian. The veteran "circumnavigator of the world of languages," as he has been somewhat grandiloquently called, A. F. Pott, contributes an "Introduction to the Science of Language"; Dr. Techmer, an elaborate treatise on the "Physical Analysis and Synthesis of Audible Speech," profusely illustrated, though the illustrations are only too familiar. This is followed by a method of transcription into italics. From Colonel Mallery, a well-known American investigator, we have a treatise on "Sign Language"; Max Müller indulges in one of his mythologico-etymological flights, which never carry him far out of sight of the sun. Especially noteworthy is the concluding article by Prof. Karl Brugmann, on the question as to the affinities of the Indo Germanic languages. The tendency of the paper is to check rash inferences as to the closer relations of two or more members of the Indo-Germanic family. We must not be satisfied with coincidence here and there; but in all the deviations from the stock, in all the innovations, we must find agreement in phonetics, inflection, syntax, vocabulary, before we can say, "Here are twins!" "Here are triplets!" The exceeding caution of the school of which Brugmann is so prominent a representative is "disillusioning"—but so is life, so is truth.

—M. Charles Joliet, who published in 1867 a little book or list of 'Les Pseudonymes du Jour,' has recently issued a second and enlarged edition (Paris: Dentu; New York: F. W. Christern). It is not exhaustive or elaborate, but it is a convenient guide to the host of fictitious names used in minor Parisian journalism and literature. Even a distant New Yorker may note the omission of M. Guy de Maupassant, some of whose articles in the *Gil Blas* are signed "Maufrigneuse"—a Balzacian pseudonym not unsuited to the curiously powerful or perverse writing of M. de Maupassant. Moreover, the pseudonym of the late Hablot K. Browne is thus set down (p. 98): "Phryz.—Knight Brown." But such slips are comparatively few, and the utility of the work is indisputable. After separate lists of ladies' *noms de guerre* and of those of men of letters, there are lists also of the real names of artists, painters, and sculptors, of composers and musicians, and of actors and actresses. Among the writing ladies who sign with a pseudonym are Mme. Blanc, who is "Th. Bentzon"; the Countess of Mirabeau, who signs her sketches in the *Vie Parisienne* with an unaristocratic "Zut" or "Chut"; the Countess of Martel, who wrote for the same lively paper, under the signature of "Gyp," a series of light sketches, since gathered into a volume called 'Autour du Mariage'; Mme. Durand, who signs "Henry Gréville"; Mme. Fould, whose signature is "Gustave Haller"; and Mme. Dussaud, who is "Jacques Vincent." Perhaps the most curious thing to be noted in the book by an American journalist is the habit which obtains among Parisian newspapers of having a signature or two which is common property, and which may be used at any time by any writer who does not care to sign his work.

—It was a foregone conclusion that the Fifth Avenue Theatre would be crowded on the occasion of the first production in this country of "Princess Ida, or Castle Adamant," a "respectful perversion" of Tennyson's "Princess." The extraordinary popularity attained by "Pinafore" insured for every subsequent work by Gilbert and Sullivan at least a *succès de curiosité*, and even reversed the judgment of the past, inasmuch as "The Sorcerer," an earlier work which had made but little impression, was subsequently revived with success. These works, together with the "Pirates," established a new style of English operetta quite distinct from the French and German styles. The fourth of these works, "Patience," owed part of its vogue to the fact that it was a timely satire on the "æsthetic craze." In "Iolanthe" it became evident that the authors had exhausted their new vein entirely, and on hearing "Princess Ida" on Monday evening most of the spectators must have wondered why the authors should persist in working a mine in which not a single nugget of gold is left, and only a few traces of silver. Mr. Gilbert's exhaustion is most conspicuous, although Mr. Sullivan seems to take pains not to offer many opportunities for odious comparisons. In "Princess Ida" Gilbert harps on his favorite old string. We have the same elegantly attired chorus of lovesick maidens grouped in a reclining posture on the stage; the same simplicity of plot, without the slightest attempt to attain dramatic suspense; and the same topsy-turvey jokes, halfway between wit and baby-talk. The verdict of the London press led one to believe that, although Gilbert's libretto was a failure, Sullivan's music fully atoned for his colleague's shortcomings. This is not the case. Some of the concerted pieces and choruses, especially in the prologue, are well written and spirited, although void of originality. The solo numbers are weak, with two or three exceptions, the best being *Lady Psyche's* song about man, who "at best is only a monkey shaved." It is often asserted that where Sullivan does not write "catchy" tunes for the people he appeals to the cultivated musician by his subtle art. This is precisely what he does not do in his latest works. Some of his lyric songs are not only beautiful as melodies, but have an exquisite harmonic accompaniment for the pianoforte, while in "Princess Ida" the harmonies are of the most primitive description, seldom rising above the level of Donizetti. A curious feature is the perceptible influence of Handel. But Handel never was a very successful Italian opera composer, and his style is hardly adapted to modern operetta. Sullivan's treatment of the orchestra is by no means so full of variety and piquant effects as Lecocq's or Strauss's. There is one passage, however, in *Lady Blanche's* song just referred to, "But it would not do: the scheme fell through," where a delicate and charming effect is produced by the violins. The performance was one of the smoothest first-night performances ever given in this city. The orchestra is small but efficient, the chorus

well trained and of excellent vocal quality, and all the *ensemble* parts, therefore, went well, combining the freshness of a first night with the polish usually only attained after many repetitions. The scenery is magnificent, especially in the prologue and second act, and the costumes not only effective but tasteful, adding a special charm of color to several of the striking tableaux. For all these things the play is worth seeing. The cast is not remarkable.

GENERAL GORDON IN THE SUDAN.

The Story of Chinese Gordon. By A. Egmont Hake. London: Remington & Co.; New York: R. Worthington. 1884.

THE return of General Gordon to the Sudan in the present critical state of affairs gives a peculiar interest and importance to his experiences in that wild and distant portion of the world when he was Governor there, under the late Khedive of Egypt, Ismaïl Pasha, and for a short time under his successor, Tewfik. The circumstances which led to his appointment as Governor were essentially the same as those which have occasioned his present mission. Then, as now, the equatorial provinces of Darfur and Kordofan had risen in successful revolt against the Egyptian Government, and the insurrectionary movement was rapidly spreading northward over the Sudan. Gordon checked this movement for the time, but only checked it. He had no sooner left the country than the causes which had produced insurrection again began to operate, and the present effort after independence which has Obeid for its centre is only a continuance of the rising which Gordon confronted and partially suppressed in 1879. To describe what he had to do, and what exactly he effected, will throw no small degree of light upon the present state of affairs beyond the southern frontier of Egypt. In reviewing, therefore, 'The Story of Chinese Gordon,' it is to this part of his "story" that we shall confine ourselves.

The hold of the Egyptian Government over its southern provinces must always be weak and precarious because of the zone or desert which separates Egypt proper from the Sudan. This desert is one hundred and eighty miles across, and, until the days of Mehemet Ali, was regarded as a barrier forbidding all attempts at conquest in the interior of Africa. Sixty years ago, Mehemet Ali crossed this desert boundary, and gradually extended his authority over Kordofan, Darfur, and away to the sources of the Nile. The want of unity among a population split up into innumerable tribes enabled him to do this with but little difficulty. He, his successors, and their agents and officers, made use of this vast extension of territory for no other purpose than kidnapping slaves, driving them in droves to the coast, and there shipping them for sale in Cairo, Constantinople, or Arabia. The ravages and the misery wrought by these slave-traders surpasses almost all that the imagination can conceive. Vast tracts of country which had been the homes of a happy population, rich in villages and cultivated land, were entirely depopulated. The lines of march followed by the slave-traders and their victims could be traced by the quantity of skulls strewn along them, showing where the wretched slaves, exhausted by fatigue and thirst, had sunk down and died. The Khedives contemplated this vile traffic with the utmost complacency until they found that the growing power of the great slave-trading tribes menaced their own authority. Until they made this discovery, they remained the great support and encouragement of the slave-trade. And the pashas, mudirs, and other officials, who were described as "governing" the Sudan in their name, took their cue from their august masters. What was called "the Government" was, in fact, an agency for carrying on the traffic in human flesh. Even the Government steamers on the Nile were pressed into the service, and came to Khartum from the interior loaded with cargoes of slaves.

The Khedive Ismaïl Pasha was the first to be converted to the views of the British Anti-Slavery Society, and his conversion was brought about after this manner. The great slave-dealers were in the habit of taking the best and strongest of those whom they kidnapped and forming them into a body-guard, which they made use of in their raids. Thus, gradually, they became possessed of a sort of standing army, greatly superior in physique, in courage, and in discipline to the wretched Egyptian soldiery who represented the authority of the Khedive. Among these slave-dealers, one man, by his wealth, his troops of slaves, and the number of his fortified stations, stood out as a kind of king. His name was Zebehr Rahama. Dr. Schweinfurth, the author of 'The Heart of Africa,' found him "surrounded with a court that was little less than princely in its details." His fortified posts were carried far into the heart of Africa, and over the whole country embraced by them Zebehr exercised despotic authority. The Khedive Ismaïl, after an unsuccessful attempt to diminish his power, was obliged to try a policy of conciliation by creating him a Pasha. This dignity did not satisfy Zebehr, and, in an unlucky moment for himself, he repaired to Cairo with £100,000 in order to bribe the Khedive and his officials into recognizing him as Sultan of Darfur. But, having got the man he dreaded into his power, Ismail was too astute a politician to let him escape. Zebehr never returned to Darfur, and he is at this moment residing in Cairo. This fate was not altogether unexpected by Zebehr. There is a large tree on the left-hand side of the road from Obeid to Shaka, about two miles from Shaka. Before his departure for Cairo, Zebehr assembled his officers under this tree and swore them to obedience upon the Koran: whatever orders he should send them from Cairo, they were to obey. When Gordon was appointed to the charge of the equatorial province, Zebehr saw him as he passed through Cairo, and strove to interest him in his favor. But, finding that Gordon would not assist him, he sent the order to his officers, "Put into effect my orders given under the tree." And so the revolt began.

It was only the accident of Gordon's nomination at this moment which saved the Khedive's Government from the ruin which has now overwhelmed it. Gordon speaks of Shaka, the headquarters of Zebehr, as a Cave of Adullam, crowded with robbers, and murderers, and ruffians of every description. They could put ten thousand men into the field. On the other side, the badness of the Egyptian Government, the worthlessness and demoralization of the Egyptian soldiery, rendered them quite incapable of holding their own against the formidable soldiers of the slave-kings. "The Government of the Egyptians in these far-off countries," writes Gordon, "is nothing else but one of brigandage of the very worst description. It is so bad that all hope of ameliorating it is hopeless. . . . One thing is certain—that the Egyptian should never be allowed out of his country." Happily for the success of Gordon's undertaking, bad as the Egyptian Government was, the rule of the slave-dealers was no improvement upon it, so far as the bulk of the population was concerned. They had committed, and were still committing, the most frightful atrocities upon the people wherever they moved.

"I have been talking," writes Gordon in April, 1879, "to some of the chiefs of Darfur, and it is lamentable to learn that more than one-third of the population has been carried off into slavery. . . . All the road from here to Shaka is marked by the camping places of the slave-dealers, and there are numerous skulls by the side of the road. What thousands have passed along here! . . . I hear some districts are completely depopulated, all the inhabitants having been captured or starved to death. If our Government, instead of bothering the Khedive about that wretched debt, had spent £1,000 a year in sending up a consul here, what a deal of suffering might have been saved!"

"I have," he writes in a subsequent letter, "just made a calculation of the loss of life in Darfur during the years 1875-79. It comes to 16,000 Egyptians and some 50,000 natives of Darfur. Add to this the loss of life on the Bahr-Gazelle—some 15,000—and you will have a fine total of 81,000; and this exclusive of the slave-trade, which one may put down for these years at from 80,000 to 100,000."

In this, then, the first contest between the Egyptian Government and the slave-dealers, the victory was tolerably certain to rest with that side which could secure the active co-operation of the people. Gordon's exhaustless energy, his ferocity against all corruption and oppression, his unwearied efforts to do justice to the people, soon kindled a perfect enthusiasm for him throughout those vast and desolated regions. The people had never seen a Governor who sought to do justice and was proof against all bribes—who warred against the strong, while he systematically shielded the weak and the poor. Gordon knew—none better—that the labors in which he spent himself would bear no fruit after his departure, but he worked none the less hard on that account.

"I cannot tell you," he writes in April, 1877, "how wearisome it is to be continually finding fault and turning out officials, etc. That is my constant work; and as I go along I am like a fire, leaving wrecks behind me. I will (D. V.) do my duty, troublesome and even dangerous as it may be. There is no use being gentle over it—the disease is too grave for gentle remedies."

"I think," he writes from Khartum on May 18, "the people like me; and it is an immense comfort that, while in the old régime ten or fifteen people were flogged daily, now none get flogged. A huge crowd stand around the palatial gates all day, but only a few are privileged with an interview; for I keep a box with a slit in the lid for petitions at the door, and every one can put his petition in it. Hitherto the people could never approach the Governor unless they bribed the clerks. . . . It is all nonsense for the Turks to say that the people would oppose the nomination of a Christian Governor. The people want justice. . . . I am breaking up, to the great joy of the people, the Bashi-Bazouks, who of course do not love me. A great sorrow has been taken off the land. The reign of the whip has ceased, and I do believe the people rejoice at my being here."

And again, a month later:

"The wrecks left on my passage are numerous. I have set my face as a flint, and, regardless of consequences, have been hard right and left. I do not wish to be so; I should like to praise, not blame; but seeing what I know of the sufferings of the people, I cannot force myself to let things slide."

Then, a few days after:

"The way these Bashi-Bazouks have treated their fellow-religionists here is far worse than in Bulgaria. . . . My second in command, Halid Pasha, only stayed ten days in his post. He tried to thwart me, so I telegraphed to Cairo, and in twenty-four hours he was ordered off. I feel sure it is a waste of time to argue with a Turk or a Circassian—the only way is to coerce him; you can never convince him. This is twelve years' experience of them. All this revolt is the fault of the Bashi-Bazouks. . . . Now, the Darfurians were so fanatical that they would never let a Christian into their country, and now they ask me to send Christian governors."

In this way it was not long before Gordon succeeded in working a complete change in the feelings of the populations around him: discon-

tent gave place to loyalty. The armed hordes of the slave-dealers found themselves surrounded by a population no longer apathetic, but actively hostile. Gordon himself was always on the move. Mounted upon fleet camels, he covered tremendous distances, and came down upon lazy and recalcitrant officials before they had time to suspect his approach. Droves of slaves were intercepted and set free, and their captors flogged and stripped of everything they possessed. In addition to all this, Gordon possessed in his lieutenant—an Italian by the name of Gessi—a soldier of really remarkable genius. To him was intrusted the conduct of the campaign against the armed bands of Sebehr, and they were completely destroyed in a series of operations which exhibited, on the part of Gessi, extraordinary fertility of resource, skill, and perseverance, amid difficulties of all kinds. After each successive defeat the population rose against their fugitive oppressors. The slave armies were annihilated down almost to the last man; and the land for a time had rest.

But "the wrecks" which Gordon speaks of as leaving everywhere in his passage, simply repaired to Cairo, and there, instead of being regarded with disfavor, they appeared as honored guests at the levees and banquets of the Khedive. They were in constant communication with his Ministers; and Khedive, Ministers, and expelled officials were soon all agreed that so terrible a reformer as General Gordon was not the man for Egypt. He was, indeed, altogether impracticable. He would not allow items of charge to be fastened upon the revenues of the Sudan unless Ministers could show that the Sudan was in some way connected with such items. He was attached to the monstrous heresy of putting the interests of the Sudanese before those of the place-hunters in Cairo. And so the end came: he was recalled; and all the officials whom he had expelled were let loose upon the province again to torture, oppress, and lay waste. Hence the insurrection which has now assumed such formidable dimensions. Sebehr's slave armies no longer existing, the population have united, by a common impulse, against the representatives of the Egyptian Government. Gordon foresaw the probability of this.

"In spite," he wrote, "of the heavy blow that has been struck at revolt, any great leader could still make himself master of the Sudan. It was not merely with the slave-dealers that the Government had to deal. They, indeed, by themselves were powerful enough to tax all the strength of Egypt; but their strength was doubled by the support which they so largely received from the tribes that many hundreds of years earlier had passed over from Arabia and had settled in Central Africa. These Arabs were men of long descent, proud of their descent and fond of war. When tried by the standard of Turkish morality, their social life was even pure. Moreover, both in their modes of life and their ways of thinking, they were far more akin than either Turks or Egyptians to the black races in the midst of whom they and their forefathers had so long lived. These children of the desert hated the Egyptian rule, and looked with scorn upon the effeminate and grasping rulers who were sent up from Cairo to govern them. They were ready—and are still ready—to seize the first chance of shaking off the yoke of Egypt. Their war cry, so Gessi reported, was, 'This is our land—we know no Effendina (Khedive) here.'

. . . . . .

"There is no doubt that if the Governments of France and England do not pay more attention to the Sudan, if they do not establish at Khartum a branch of the Mixed Tribunals, and see that justice is done, the disruption of the Sudan from Cairo is only a question of time. This disruption, moreover, will not end the troubles, for the Sudanese, through their allies in Lower Egypt—the Black Soldiers I mean—will carry on their efforts in Cairo itself. Now these Black Soldiers are the only troops in the Egyptian service that are worth anything."

This prediction has since been verified. The insurrection in the Sudan is a revolt against intolerable misrule. It is the fact of this misrule which has given to the revolt cohesion and strength. The religious element in it is subordinate, and, as it were, forced upon it by the constitution of a Moslem state. That constitution is theocratic, and if the Khedive or any other Moslem sovereign can get the orthodox expounders of the *Sheriat* or Moslem law upon his side, he can always make it appear that those in revolt against his authority are also rebels against the Divine Law. He can, in a word, pronounce sentence of excommunication against them. The possession of this spiritual weapon on the one side forces the other to claim spiritual authority also, and declare that it is acting upon an independent religious basis. The leader of the present rebellion, though he is reported to have declared that he is "the Mahdi," has, in all probability, not claimed that dignity at all, but the humble one of being a forerunner of the Mahdi. This would be a far safer rôle to play. To the achievements of "the Mahdi" proper there can be no limit. But a forerunner of that tremendous personage may perhaps be regarded as having established the authenticity of his pretensions when he has expelled the Egyptians from their equatorial provinces.

THE RUMANIAN LANGUAGE.

A Simplified Grammar of the Roumanian Language. By R. Torceanu. London: Trübner & Co. 1883. Pp. 71.

It is to be regretted that Mr. Torceanu confounded the meanings of the words *simplify* and *abridge*, for Rumanian grammar is so simple in itself that the addition of a very few pages would have rendered his book much clearer and more intelligible, and quite as sufficient for ordinary use as the more elaborate work of Maxim (Hermannstadt, 1877). There is not a word, for instance, about orthography, and yet one of the first difficulties that confront one on opening a Rumanian book is the varying spelling. There are at least two systems in vogue, both strongly supported. Where some write words with an *ea* or *oa*, as *seara*, 'evening,' *noapta*, 'night,' others write with an *é* or *ó*, as *séra*, *nópte*. The letters *â*, *ê*, *î* have exactly the same sound, somewhat like that of *i* in the English pronunciation of the word *squirrel*, and properly are varied only according to the derivation of the word to show the original vowel; but frequently they are confused, and it may be necessary to make all the possible variations in the word before it can be found in the dictionary. Thus *blând*, from the Latin *blandus*, is written *blênd* in Costinescu's dictionary. Torceanu, in the book before us, uses *ă*, *ĕ* instead of *â*, *ê*, and spells his own name with *ea* instead of *é*, as is his usage for other words. Should *di*, 'day' (Lat. *dies*) be written *di*, *ḑi* or *zi*? Usage differs. Then there is the question of the final *u*. Should it be written at all, or should it have a short accent, *ŭ*? Torceanu gives us this plain and almost Irish rule: "*ŭ*, when it occurs at the end of a word, is pronounced like a silent *u*, which is called *ŭ* short." In fact, *ŭ* and *ĭ* at the end of words correspond exactly to the Slavic so-called semi-vowels ъ and ь and are not pronounced, although the *ĭ* affects somewhat the sound of the preceding consonant—changing, for example, *t* into *ts* or *ty*, or, as it is written, *ţ*. The use of the final unpronounced *ŭ* is now discouraged as unnecessary, awkward, and wasting space, although the great newspaper of Bucarest still continues to call itself *Românulŭ*. Its disuse relieves the language a little of its reduplicative appearance, though strangers still judge it by one of the first signs they see on driving into Bucarest from the railway station: *Biuroulu Regiei Monopolului Tutunuriloru*. The final *ŭ* was originally either part of a lost termination, or has been added to words by analogy on the theory that no word could end in a consonant.

The unsettled orthography of Rumanian should not seem strange to us when we remember that it is scarcely thirty years since the Latin alphabet has been in use. Before that time, except for a short period, when the Phanariote princes tried to introduce the Greek alphabet, the language was always written and printed in the barbarous Cyrillic or Old Slavic characters—not even those more shapely ones used by the Russians, Bulgarians, and Serbians. The spread of education has been rapid since the nation awoke to life and vigor as a *contre-coup* of the Crimean and Italian wars.* The tendency of Rumania is toward Western civilization, and the old alphabet has so completely disappeared that in the courts of justice it is necessary to employ an expert to read contracts and other documents written forty and fifty years ago.

The grammar of Rumanian is almost purely Latin, and now that words are written legibly, more or less regularly, and without abbreviations, it needs but a glance at a book or a newspaper to see this. One of the great exceptions is that the definite article is affixed to the word instead of preceding it. Some have tried to see the origin of this *-ul* in the Latin *ille;* others have attempted to show that it comes from a Slavic source. It is a curious fact, however, that this peculiarity is shared by three languages of the Balkan peninsula, and that we meet with it nowhere nearer than in Scandinavia, or the Caucasus. Even though the article in Rumanian, like that in French and the Romance languages, be traced to *ille*, and the Bulgarian *-to* to the Slavic demonstrative pronoun *tot*, still the habit, in common with the Albanian, of placing the article after the word, as a component part thereof, may well lead grammarians to see in this a relic of the early Dacian or Pelasgic language (call it by what name you will) which was once predominant in those parts.

Certain terminations and methods of forming derivative words betray a strong Slavic influence. But the Slavic influence has been exercised chiefly upon the vocabulary. Here we touch a subject with regard to which the Rumanians are curiously sensitive—their ethnology. They are most anxious to think themselves of Latin race, and consider any proof of foreign mixture as a disgrace. They prefer to be descended from the Roman legionaries—few of whom were of Latin blood—rather than from the most courageous of Dacians, or from the bravest Slavs, or other barbarians, who conquered the Roman mercenaries. To such an extent is this feeling carried, that Rumanian statesmen gravely interpret an article of their Constitution forbidding the colonization of the country "by populations of foreign race," as allowing colonization by Italians, French, Portuguese, and Spaniards. With regard to the composition of the language, we must cite Cihac, the only writer who has thoroughly studied it. We know that Cihac is discredited by Rumanians of the Latin school, but personal experience has convinced us of the justness of his views. (Perhaps the reviewer may be allowed to confess here that he has no Slavic blood, much Platt-Deutsch, and a little trace of French and Indian blood, of which he is very proud.) According to Cihac, then, who has written the best dictionary of Rumanian, the vocabulary is composed one-fifth of Latin words, two-fifths of Slavic words, and the remaining two-fifths of

* With a population of nearly 5,400,000 there were under instruction in all the schools and universities 103,397 in 1876, and 182 584 in 1881. There were in 1881, besides the two universities, 2,526 primary schools, and 309 of various grades.

words derived from the Turkish, modern Greek, Magyar, and Albanian. The Slavic form is seen in a great number of suffixes, used also for non-Slavic words, in family names, as well as names of places, which are more than half Slavic (though it is to be noticed as a peculiarity of Rumania, different from all Slavic and most Latin countries, that there is scarcely a single village named after a saint); in the names given to flowers; in the language, the subject, and the form of popular poetry; in numerous feasts and superstitions. Notwithstanding the great Greek clerical influence in Rumania, it is curious that the terms of the Church, principally Greek, have for the most part come through the Slavic. Some slight distinction should be made between the vocabulary of Rumania proper; that of Bessarabia, which has been submitted to Russian influence; and that of Transylvania and the Banate, which have for many hundred years been under Magyar and German rule. The general result is the same.

Even in finding fault with extreme views of all kinds, we must take into consideration that the Rumanians were for centuries enslaved to Slavs, Magyars, and Turks, and that it is but natural that they should prefer the claim of belonging to a higher race and civilization—the Latin. This, however, has brought the Academy into what we can but think a great error. An effort has been made of recent years to expel all the non-Latin words from the language, and to put in their places Latin, Italian, and French words. Similar efforts are made among all rising peoples, as, for example, Greeks, Hungarians, and Finns, with perhaps more reason. But to us English-speaking people, who prize our own language and its composite origin, the policy of the Rumanian Academicians appears a seriously mistaken one. Their mixed tongue, with its differences of accent, seems to us now the most euphonious of Latin languages, even superior to Spanish, and one which it would be a crime to spoil. Fortunately the good sense of the people is superior to that of the grammarians and Academicians, and already the reaction is beginning to be visible. Let us hope that Young Rumania will reject a mere Latin-French jargon, and preserve a tongue which, next, perhaps, to English, lends itself best to eloquence and poetry.

CODIFICATION IN NEW YORK.

The Proposed Codification of our Common Law. A paper prepared at the request of the Committee of the Bar Association of the city of New York, appointed to oppose the measure. By James C. Carter, a member of the Committee. New York, 1884.

THE revival of the agitation for a code in this State has had at least one very good effect—it has caused some of the ablest lawyers in the country to examine the whole question of codification anew in the light cast upon it by the research and discussion of the last twenty years. Among them, no one has brought to the work more ability and fairness than Mr. Carter, whose standing as a lawyer, it need hardly be said, is of the highest. He appears as a member of a committee professedly hostile to the Code proposed for adoption at Albany; but it is well known to many of our readers that the Bar Association of this city had no original bias against codification in general, or this code in particular, but was driven into hostility to it by the discovery of the real character of its contents, brought out by close and impartial study. Mr. Carter's opinion is properly to be considered not that of an advocate, but of an extremely competent judge, and it is one entitled to very great weight. It is not, of course, decisive, nor does he put it forward as such; but it ranks with any of the ablest English judicial opinions on codification which have been brought out by the recent discussions in Great Britain.

Mr. Field, we believe, still maintains that the Legislature of this State is under a positive obligation arising out of the history of codification to adopt his code in some form; and if this is true the field of discussion is very narrow. But the idea that the Legislature in 1884 is obliged to codify because the State twenty years ago authorized a commission to draft and report a code, appears to have no solid foundation whatever. That a civilized State should have irrevocably pledged itself to codify, even if codification were proved by experience to be a work requiring generations for its execution, is conceivable; but it is too much to ask us to believe that it pledged itself to codify, if codification should be shown by experience to be impracticable or unwise.

The battle, therefore, rages really over two points—first, the question whether the proposed code is a good piece of work of its kind, and, second, whether the work can be done at all. Mr. Carter's pamphlet is an important contribution to the solution of both these points. To follow his own order of treatment, it is important for any one who wishes to get a full understanding of the controversy to remember that, since Bentham's time, the whole drift of the discussion about codification has taken a new turn. Bentham discussed it in a wholly abstract way. Can the law be codified? Bentham said that it could, because the principle governing the decision of a case by a judge could be written down in a brief form. If the rule of decision can be extracted from one, it can be from a hundred cases, and in this way we get a rule of law which we can put in the form of a statute. By getting together all the rules of law out of all the cases and throwing them into the form of a statute, we get a code. Nothing can be simpler. We pass statutes every day. Why not a code?

Since Bentham's time, however, the analytic, abstract method of considering such questions has been shown to be incomplete. Before we give an answer we must look at the matter in an historical aspect. We must ask what a code has been in the past: whether our law develops itself in a way which makes the reappearance of such bodies of law as in other nations are called codes likely or desirable, and above all what effects, judging by the past, the adoption of a code will produce. It was always assumed by the early school of codifiers that a code would necessarily produce certainty and uniformity in the law, chiefly because they confined their attention to the work regarded as a collection of rules of law, and wholly neglected to inquire what effects the past history of the law made it probable that the codification of such rules would entail. All this is rather implied than stated in Mr. Carter's book, but it should be constantly borne in mind in considering what he says.

Mr. Carter contends that the great body of private law—that relating to contracts, the domestic relations of parents and child, husband and wife, that which governs the transactions of business, and the exchange of commodities—cannot be codified, while he admits that the public law (that relating to the State, and the connection of the citizen with the State) may. The penal law (which is in the main statutory) he also lays aside as confessedly codifiable. This law, and the law of procedure, indeed, in this State have been thrown into the form of codes already. But the great body of what lawyers call case-law, or what Bentham calls judge-made law, he says cannot be put into the form of a code so that it will, if created to-day, represent accurately and finally and certainly what the law is.

The reason for believing this to be a true view of the matter is in large part historical. In a few words, it may be said to be that the countries in which codes have been resorted to, are governed by a system of law in which the administration of justice by magistrates independent of the sovereign is unknown. All the modern Continental codes are based upon the Roman law, and in Rome law was something defined and imposed upon the people by a sovereign. May we not indeed go further than this, and suggest that codification is in great measure a survival of primitive law? The Twelve Tables, the laws of Manu, large portions of the Old Testament and the Koran are codes; but it would be felt to be absurd to cite any of these as reasons for adopting the proposed civil code at Albany. Yet in some respects it may be shown that the Code Napoléon or the Prussian Code resembles these very closely, and that an argument founded upon the success of codifiers in France and Prussia is equally irrelevant here. In neither France nor Prussia, nor in any country governed by the Roman law, is the judiciary independent of the executive. The French or Prussian judge declares the law as he finds it in the code; he administers the code as the expression of the will of the supreme power, and has never attempted to develop the law for himself, in our sense of the word. This, however, is precisely what the Anglo-Saxon judge has done. In his hands the function of administering justice has been wrested from the executive, and vested in a separate branch of the Government, which recognizes no superior but justice itself. Executive interference with the judiciary has, in England and in this country, long been unknown. With us even the Legislature is cut off at many points from trenching upon it, by constitutional provisions guaranteeing the sanctity of contracts, of property, of life, and liberty. The Anglo-Saxon judiciary has intrenched itself behind a principle which, if not unknown, is certainly strangely unimportant in Continental jurisprudence—that of *stare decisis*—the principle that makes the decision of every generation of judges binding upon its successors, and which yet permits the growth and development of the law by confining every rule to the identical facts to which it was originally applied.

Such has been the progress of Anglo-Saxon jurisprudence in England and the United States for three centuries. What a code, if successful, must do, is to bring this progress to an end, and to reverse the law of its development. The judge must become the creature of the code; he must not look beyond its letter, into the immutable principles of justice and right, or the customs of men out of which all rules of law grow, but he must obediently apply the written rule as he finds it. Could this be accomplished, a code could be introduced at once. Yet it is so obviously impracticable that no one has ever dared to propose it. The proposal involves the idea of a return to a primitive conception of law and justice hitherto universally recognized as inferior to our own.

But it may be said, Why does not all this apply in a modified form to legislation? The Legislature is continually altering and amending the law. Why should it not also codify it? The answer is first that when sudden and drastic changes of the law are proved by experience to be necessary, it is impossible to await the slow process of its growth and amelioration in the courts. There must be somewhere a power to change the law rapidly, and we vest it in the Legislature. But this is a wholly different matter from codification. In codifying we transfer to the Legislature the work that for ages the judges have

performed—that of declaring, while engaged in the administration of justice, exactly what the law is. So far have we exalted this function in the United States that we have enabled a judge to nullify an act of the Legislature, simply because he conceives it to be in conflict with the principles of justice which we make permanent as constitutional law. It is indeed our constitutions which are our true codes, and which contain the only rules that we deem worthy to be made eternal, immutable, and irreversible. And what are they? That nothing shall impair the obligation of a legally binding promise; that the humblest and even the worst man shall be protected against the mightiest and the best in his life, his property, and his liberty; that there may be tribunals on earth in which neither favor, nor interest, nor wealth, nor strength counts in the scales. And there have been courts and there are courts, where this great ideal of our race is actually realized.

If this view of the subject is correct, it puts the whole dispute as to codification in a new light, and moreover it accords with the view that most of us have been taught by experience to take of the whole relation of the Legislature to the judiciary. The nearest approach to codification that we can make is to give the body of private law temporarily the form of a statute. Upon this statute will immediately accumulate the same gloss of judicial interpretation and exposition that all other statutes suffer, with the additional defect that we have made possible in every case a dispute about the meaning of an arrangement of words, as well as a dispute as to the proper application of principles. Every lawyer knows that no statute is ever administered in a court of justice in this country without a careful examination by the judges, first, as to what the law was before the statute was passed; second, what effect the statute was intended to produce; and third, what effect it has produced. If we make all law statutory, we make all this inquiry necessary in every class of cases, where now it is necessary only in a few; and as it is confessedly impossible to make a perfect code at one stroke, the Legislature would be perpetually at work amending and altering it. This is precisely what has happened in the case of the code of procedure, a subject generally admitted to be easier to codify than any other. Codification has merely rendered a lawsuit possible over every point which was formerly a matter of "practice," to be learnt by familiarity with the rules of court.

What is there in such a prospect to attract any sensible man, or make him think that codification will make the law simple, certain, and intelligible? Our judges may not be perfect, but they are better than our Legislatures, and the transfer of the function of declaring what the law is, from one to the other, must practically be expected to have still worse results than if the assumption (always underlying the argument of the codifier) that the Legislature can be trusted to do the work well, were true. But it cannot, and here the character of Mr. Field's code greatly reinforces the abstract argument. This body of law, which is the result, on his own showing, of a twenty years' experiment by the State, is neither a complete code, nor a coherent code, nor an intelligible code, nor a code which states the law as it is. The examination of its provisions made by Mr. Carter and his associates has resulted in showing that it is so bad a piece of work that it could lead only to enormous confusion in the best settled branches of law. A doubt about codification is a serious matter; what are we to say of the certainty of its being a failure? When Mr. Field began his work there was a general hope that he would succeed. His failure to produce a respectable piece of codification may not be conclusive as to codification in general, but, taken in connection with the total change in the modern way of looking at the whole subject, it is enough.

History of Prussia to the Accession of Frederick the Great, 1134–1740. By Herbert Tuttle, Professor in Cornell University. Boston: Houghton, Mifflin & Co. 1884.

THE task which Professor Tuttle has here undertaken is a very difficult one, and one which, perhaps on account of its difficulties, has never before engaged the serious attention of any English or American scholar; though surely there could be no more worthy occupation for the ablest historical pen than a description of the growth of that political system which came prominently into notice in the time of Frederick the Great, and again so astonished the world in the second half of our own century. Our author's purpose is briefly but clearly expressed in the preface. He has attempted, not to give a narrative of events, but to describe the political development of Prussia from the earliest times down to the death of the second King. This has led him to make somewhat minute researches into the early institutions of Brandenburg, and accordingly, as he says, "the development of the Constitution has received more attention than wars or treaties, than dynastic intrigues or territorial conquests." The reader, therefore, may as well be warned that the book holds out very few allurements to those who "need to be tempted to the pursuit of knowledge." The great questions which go to determine a nation's policy and a nation's growth are often very subtle in their nature, and are seldom very interesting in their details; and hence it follows that the author of a work of this kind, who holds steadily to his purpose, inevitably runs the risk of producing what will popularly be called a dry book. Indeed, Professor Tuttle has so rigorously excluded all but the most essential facts, that when he seems compelled to enter into interesting details, he actually forces himself into an attitude of explanation or apology.

He begins with a chapter on Primitive and Mediæval Brandenburg, and follows this with a description of early society and institutions. To this, again, succeeds an account of the chaotic condition which prevailed in Germany during the seventeenth century, and of the way in which, on the election of Sigismund to the imperial throne, Brandenburg passed to the House of Hohenzollern. The overthrow of the Diet, and the virtual establishment of absolutism under the Great Elector, the weak foreign and domestic policies of Frederick I., and the final organization of the government under the eccentric Frederick William I., are the subjects which occupy a greater portion of the volume. Throughout, the design has evidently been not to bring new facts to light so much as to show the significance of such facts as are already well established. Professor Tuttle has not generally made use of original sources, but he has constantly availed himself of the ample materials which for years the scholarship and the industry of Germany have been bringing together. The general reader will probably find the first chapter the least interesting; but if his intelligence is sufficiently robust, and his interest sufficiently scholarly, to carry him through the remainder, he will certainly be rewarded by finding that, with perhaps the exception of the chapter on the Foreign Relations of Frederick William I., the work steadily improves from beginning to end.

The history of the development of Prussian institutions naturally and logically divides itself into three parts: the period of early and independent local institutions, the period of chaotic struggle between these institutions and the feudal chieftains, and the period of the triumph and the exercise of absolutism. Now, looked at from the point of view of the welfare of the people, what was the fundamental peculiarity of this succession of struggles? The first answer is that the early institutions, however promising in themselves, were so feeble in their character that when they came into contact with the methods of feudalism they were utterly powerless to preserve and protect the rights of individuals. A period of chaos ensued, in which there was a constantly increasing accumulation of power in the hands of petty nobles. But chaos always does and always must come to an end, and it invariably yields to the strongest force in the state. The elements of the contest in Brandenburg and Prussia were not essentially different from those of similar struggles that were going on elsewhere in Germany and in other parts of Europe. Wherever local institutions had been established, the struggle was a triangular contest between those institutions, the several orders of nobility, and the head of the state. This struggle, though essentially the same in its fundamental characteristics, terminated in various ways, in regard to which it is enough for our purpose to say that the interests of the people were best subserved in those nations where the King was triumphant, and where, by virtue of his triumph, he drove the nobility and the people into a defensive alliance. The typical example of this result was in England. But the issue in Prussia, though coming at a much later period, differed little. The problem, from the accession of the Great Elector to the death of Frederick the Great, was in its fundamental characteristics not very unlike that which confronted the Norman kings. Was the King or were the nobles to be the dominant power of the state? In England, the triumph of absolutism under the Conqueror and his successors was long regarded as a political misfortune; but it is now almost universally admitted that it was the Conquest which established the nationality, and drove the nobility and people into that sympathetic alliance which produced the Great Charter and the House of Commons. So in the case of Prussia, the establishment of absolutism has resulted in a similar combination, and political relations are shaping themselves in Germany during the present century very much as they shaped themselves in England four hundred years ago.

To this analogy the objection may be raised that Brandenburg passed through all that experience in the thirteenth century, and that it was only the rapacity of the Electors that prevented at that time a development of those institutions which are just now beginning to take shape. Did not Brandenburg already have parliamentary institutions, and did not the people already have a Great Charter? True, but it must not be forgotten that they were powerless to accomplish their work. Probably the institutions of England would have been equally powerless but for the necessities of English Kings in carrying on their Continental wars. At all events, it is certain that in Germany the Diets were helpless to protect the people; and it was because of this weakness that they passed out of existence, not only in Brandenburg but in every one of the other German States. And we believe that every scholar who has noted the way in which the Diets were made up, and the way in which their business was carried on, will hesitate long before deciding that their fall was any misfortune to the people. The real question

in the struggle was, Where is the chief power of the state to be, in the hands of the King or in the hands of the nobles? And when this was the issue, it was doubtless for the good of the land that the King should triumph, for the simple reason that, taken at its best or at its worst, the absolutism of a single monarch is preferable to the anarchy of a horde of nobles.

We have left no space in which to examine the details of the present volume, which we commend to the thoughtful attention of our readers. We trust it is but a forerunner of other volumes which will give us an account of the large remaining portion of Prussian history.

Marie Antoinette. By Sarah Tytler. [The New Plutarch.] G. P. Putnam's Sons. 1883. 12mo, pp. 234.

Miss Tytler's life of Marie Antoinette has all the merits which one seeks in a short biography, and we have no doubt that it will be accepted as the most satisfactory sketch of its subject. Her aim is biographical rather than historical, and the reader receives from her a vivid impression of the charm of personality and the innocent life of the Queen. At the same time the book could not help being largely historical, and the historical chapters are graphic and instructive. What we miss, in the truthful and sympathetic sketch of the Queen's character, is a distinct appreciation of her influence on the history of the time. No one nowadays would repeat, or even incline to believe, the slanders that were current against her at the time, nor to make her directly responsible for the misgovernment which caused the Revolution. Nevertheless, it must be acknowledged that her public influence, such as it was, was not good. If the greatest misfortune of the time was a King who did not know how to govern, it was no small evil that there was a Queen who had no comprehension either of the nation over which she was placed, or of the circumstances and forces which surrounded her. Her husband would have made an excellent locksmith; she would have been a charming and blameless duchess. Neither of them was suited to a throne in troublous times.

Electricity, Magnetism, and Electric Telegraphy: A Practical Guide and Hand-Book of General Information for Electrical Students, Operators, and Inspectors. By Thomas D. Lockwood. D. Van Nostrand.

Mr. Lockwood is already favorably known by his 'Practical Information for Telephonists,' which has had an extensive sale. His present work is especially prepared for the benefit of the large class of persons who are practically employed in connection with the telegraph, the telephone, the electric light, etc. The author's design is to aid those "self-helpers" who desire to obtain a knowledge of the science of electricity, but who have not had, and are unable to obtain, the advantages of a collegiate or other institutional training. This is admirably carried out, and besides being useful to the class for whom it is especially prepared, the work will be found interesting to the general reader, because of the simplicity and directness of the author's style and his symmetrical arrangement of his topics.

The earlier chapters of the book are elementary, treating concisely and clearly of frictional, voltaic, and thermal electricity; the phenomena of earth currents, magnetism, and electromagnetism. Then follows a statement of the theory and construction of magneto and dynamo-electric generators; a chapter on induction-coils and condensers; a chapter of definitions of electrical terms; and a chapter on electrical measurements, which is especially noteworthy, because the author, while making the subject clear, has abstained from the use of algebraic formulæ. The remaining chapters, rather more than one-half of the book, are devoted to descriptions of the various practical applications of electricity, and are followed by a copious and well-arranged index. The superior mechanical execution of the book—its large, clear type, fine paper, and numerous well-executed illustrations—contributes greatly to the comfort and pleasure of its readers.

The Silverado Squatters. By Robert Louis Stevenson. Boston: Roberts Bros.

Many readers have doubtless already found much enjoyment in Mr. Stevenson's entertaining sketches of California scenery and life, which were printed not long since in the *Century*, under the title of "The Silverado Squatters," and are now collected in a volume. Silverado is the name of an abandoned mining camp, well up on the slope of Mount Saint Helena, about a day's ride from Calistoga, in California. The squatters were the author, his wife, and son, who, apparently wandering in quest of some secluded spot where they might enjoy a quiet out-door life, drifted in this direction, and took possession of the deserted and dilapidated house which had formerly been the assay office and dwelling-place of the manager and men who once worked the now idle mine. The noise of the workmen had given place to silence, and not a soul remained to care for the wreck. The squatters had few neighbors, and none near by; and they spent in the quiet enjoyment of nature, or of their available resources in art and literature, whatever time the cares of living left at their disposal. There is but little told in the way of a story. The chapters are a series of sketches; but whether the author chooses for his subject the aspects of nature or the study of his fellow-men and women, who chance for the time to be his associates, he shows the observing eye and graceful touch of an artist.

BOOKS OF THE WEEK.

Brackenbury, Col. C. B. Frederick the Great. New Plutarch series. G. P. Putnam's Sons. $1.
Cotterill, Bishop H. Revealed Religion Expounded by its Relations to the Moral Being of God. G. P. Putnam's Sons. $1.
Litchfield, Grace D. Only an Incident: a Story. G. P. Putnam's Sons. 75 cents.

Fine Arts.

THE WATER-COLOR EXHIBITION.

The Hanging Committee of the Water-Color Society have shown a large sense of the function of decoration in the arrangement of the collection of drawings and the ornamentation of the rooms of the Academy, and, perhaps, while increasing the strength of the *ensemble*, have diminished the purely pictorial power of the separate contributions. What with tapestries and decorations, the studied harmony of the arrangement which subordinates each drawing to a general effect, and the persistent character of so much of the work—a character not so individual as one might desire, but still not so peculiar in its general tendency as to merit the distinction of a school—it is hard to form a rapid general judgment on the exhibition. There is a first impression of cleverness and good technical qualities which on closer analysis is not sustained by the generality of the drawings, which are, in by far too large a proportion, only technically noteworthy. Nor is the general technical merit of that higher kind which shows severe and long training, but that which is the result of facility rather than certainty of hand: clever washing of color, rapid and fresh approximation to really good work rather than complete rendering of what is aimed at, a careless and haphazard hitting at effects without the attempt to remedy, seriously and patiently, the shortcomings of the first work. One is at first surprised at seeing so much rapid and effective work, but finally discovers that it is a *parti pris* to do as much as can be done with facility and an appearance of masterly directness, and then leave the drawing for what it is worth. Out of nearly seven hundred drawings there are not above one hundred and fifty which show signs of really earnest grappling with the difficulties of the material, and the determination to do the artist's very best. And yet the greater part of the exhibitors are scarcely beyond the position of students of the elements of art. There are by far too many drawings here whose object was attained with the quality of a wash and the indication of a broad and artistic effect—indolent trifling with a fascinating material, and at best only portfolio successes: studies of in-doors or out-doors to be kept in the studio for aid and suggestion in more serious and persistent work. This trifling is not art, it is not even study; it is the vagabondage of natures which enjoy the unrestraint of artist life—its more impulsive and emotional side—and shirk the severe discipline and long technical training by which alone the doing of good work is possible even to the most seriously disposed and greatest painter. These emulations of the broad and masterly treatment of the great painters, without any of the certainty of hand and security of method which the great painters had, are simply a waste of life and labor. The man who cannot do the simple, labored, and student-like work which seems to be avoided as confession of weakness, will never do great work. The short cuts to greatness do not exist in art any more than in science, and the most fertile and artistic nature, without the severe application which alone can give certainty of method or result, wastes itself in the vagabondage of impressionalism. An artist whose technical success is his best claim to notice, is certain to end by losing all his hold on general appreciation.

This must be our general criticism on the larger part of the drawings exhibited, and which could only be particularized in identical terms—fresh, bright quality of color, good indication of pictorial effect, but no drawing and no serious attempt to realize the finer traits of the subject; the more trivial technical qualities well developed, the higher utterly wanting. This is a discouraging diagnosis for a young school, but the malady is there, and the fault is not with the critic. It is no more conclusive to say that the Hanging Committee should not have accepted the mass of trivial and inconsequent things that are hung, for the artists thought them fit subjects of criticism or they would not have sent them. And it may be said once for all that accepting water-color as a branch of painting simply because it is more agreeable when half, or ill, completed, is preaccepted failure. The medium has great advantage for the modern vein of art—it is, on the whole, easier than oil and less liable to alteration by time or the effect of light and darkness, and it lends itself to the diminished scale of execution which is fitter for modern collectors than the large scale which is generally necessary to give freedom to the painters in oils, while the qualities of color which mark the true colorist are far more readily attained in water than in oil. These are reasons which ought to weigh both with the artists and the public, but which are of no value unless the painter finds the method worthy of as serious application as his patience and capacities will permit. It is a trap to desultory and insincere painters.

There are two distinct aims which the use of water-color permits and which in their separate way are admissible as legitimate objects of the most sincere study, viz.: the quality of freshness and reality which is only to be got by conscientious work from nature, carried to the extreme of the artist's ability; and the study of harmony of line, mass, and color which constitute the qualities of art, and in the pursuit of which the too close attention to nature is an embarrassment, and, more or less, a cause of failure. The latter aim is that pursued by most of the great water-colorists of the English school, and in our water-color exhibition there are some successful followers of its traditions. The drawings of Messrs. H. Farrer, S. Colman, and W. T. Richards are, in the main, completely successful realizations of this motive. The Nos. 156 and 359 of Mr. Farrer are admirable examples of the traditions of the orthodox water-color school of England, of which Copley Fielding and Barrett were the early masters—strong in effect of color, with a purely transparent method, and deep, quiet, golden-gray tones in entire harmony; good tonality without any attempt at range in color-harmony, but the most complete attainment of the self-imposed limitation of the artist's form of art. The No. 156 has a peculiar tenderness and subtlety in the rendering of the local color of the middle distance against the twilight sky; and though the foreground is not well selected in reference to the lines of the picture, it is in excellent keeping, and the shimmering reflections in the pool are well rendered. The sky in 359 is a glorious golden, cirrus-filled sunset, composed with great feeling, and glowing like a sunset of Copley Fielding's. The foreground again is the weakest point, and seems to be chosen for its difficulty, but there is no success in meeting it. The painting of a common highway with no object to break its absolute uniformity, the converging lines of rut and road filling the entire breadth of the foreground, is not an inviting task, and Mr. Farrer has only done with it what any one could have done. Mr. Richards's No. 355—"Limits of the Unresting Sea"—an open beach with the open sea coming in with a dull, monotonous surf, running up the flat sands, and a gray aerial sky, without incident of cloud or sun, is certainly as commonplace in choice of subject as anything can be, and bears the marks of being a favorite theme and effect, but is rendered with a painstaking and subtle feeling for tone and quality of air and space, a delicacy of gradation from one edge to the other, which is rare and admirable. Of Mr. Colman's work there are several types. The Moorish architectural subject, No. 461, gives the greatest range of his pictorial power, but No. 312 is the more powerful in sentiment and freest from a certain painful tendency to blues which injures some of his drawings greatly.

The distinction between naturalistic and artistic ideals which is so easy in landscape—where at need the artistic ideal sacrifices any and every particular fact to bring out "the light that never was, on sea or land"—becomes almost theoretical in application to figure painting, and not at all easy to draw. It does, however, exist, and of the representative pictures in the exhibition of one or the other class, the "Companions," No. 28, by A. M. Turner, and No. 45, "His First Business Venture," by T. W. Wood, will best serve to illustrate it—both strong and in their kind excellent works. The drawing by Mr. Wood is a skilful and honestly painted realistic study, brilliant in local color, well drawn, carefully modelled, and as method of painting most judicious and solid. All absolutely realistic artists, however, stand in danger of missing some of the greater qualities of realism, and becoming what we might call actualistic. The larger realism embraces the *ensemble* in all its relations, and of these the influence of position on the subject of the picture is one of the chief. To put this in terms no one can misunderstand, we may say, for instance, that the most strongly realistic figure painted in sunlight and posed in a twilight landscape would be an incongruity which no one with an eye would fail to detect, though similar violations of reality in realistic work often pass unnoticed. This brilliant study of Mr. Wood's, for instance, strikes us as painted in a concentrated studio light, while the background indicates an out-door pose. But the out-door light is broad and "all-around"—it flattens the modelling, and grays all local color, and the figure or figures are part of the general scheme of color and light and shade, in which no "bit" of local color can separate itself from the general harmony. In this respect Meissonier shows himself a true master in all those secondary qualities of realism which come into the superficial conception of the subject. This unity Mr. Wood's picture misses—the figure is painted in a light which it does not stand in, as indicated by the accessories. Now Mr. Turner's subject, conceived in a poetic relation, is consistent throughout. It is not realistic—its color is distinctly due to the painter's feeling, and the scheme is far from that which a bit of severely actual color would have made necessary; but it is entirely harmonious in color, solemn, and in complete accord with the meditative character of the subject. It is most distinctly a work in the higher vein of art.

The "Pandora" of Mr. Church is a brilliant fantasy in decorative art, with a vein of playful imagination which wilfully sends consistency with the myth or with material probabilities to the right-about. The Pandora is a slight, active slip of a girl, charged with a strong box like a bank safe, which, in her genuine fright at having disobediently opened, she has shut, and, vaulting on the lid, seeks to compress the struggling imps within to their original prison quarters, while her eyes, dismayed, follow the interminable wreath of escaped woes which is melting into the empyrean. It is not the Greek Pandora myth, but a variation on it, whose entire consistency with itself is justification enough for its creation. The method is not one to develop the high qualities of color as they may be rendered in water color, and the artist's choice of it probably indicates his comparative indifference to that side of art. On this point, certainly, we can say *de gustibus*, etc., for no painter can be expected to be true to another standard than his own. The two decorative drawings by Mr. Weldon—"Flirtation" and "The Elopement"—deal with doll life in a whimsical vein, and are so good in their way that they hardly become amenable to the strict criticism which awaits more serious work. A Japanese doll, fallen victim, like beings with brains, to contiguity, contrives an attachment to a pretty Parisian *poupée*, and flirts in a wooden way in one tableau; and in the other bears his doll-love away into the doll heaven, with the aid of a few India-rubber balloons. The execution is facile and sufficient for its purpose: more realism would perhaps be out of place in the generally decorative plan. Mr. Dielman's "Between Sittings," No. 316, is good drawing and satisfactory color. The subject is perhaps commonplace enough to make something more thorough in the treatment desirable, but, on the whole, there is a more than usual balance of good qualities. Still, work of this kind, which is in the vein of *pose plastique*, distinctly realistic, and presenting no difficulties in realization to the last degree, ought to be carried further than this is, or than anything in this vein in the exhibition. The drawing called "Greta," No. 394, by Thulstrup, is perhaps, on the whole, as good an *ensemble* of the good qualities of water color as we could hope to see, and certainly for tone, quality of color, and strength of general effect, it has nothing to ask of oils. The broad effect of the low-toned, blue-gray snow under the yellow break of sky, and the purity and brilliancy of the flesh color in the girl's face, coming as shadow against the same break of light, may be pointed out as technical successes of a high grade; while the action of the girl as she comes swinging down the path in her Sunday gown, solid on her feet and sure of herself, is in the best vein of figure drawing.

Of landscape in the realistic vein there are some remarkable studies by Mr. H. P. Smith. "A New England Village," No. 56, is an elaborate and very exact study of a familiar subject, the typical New England houses buried in the foliage of their streets and gardens, curiously true to local color, but with all the houses distressingly out of perspective. The two smaller studies in the same vein, No. 253, "River Scene in England," and No. 416, "Summer on the River Loire, France," have the same quality of refined realism and more pictorial treatment, with the advantage of very picturesque material. The reflections in No. 253 are, however, entirely false. The success of Mr. Smith in these studies in giving the peculiar qualities of gray green which a broad sky illumination gives to masses of foliage, and in rendering the modulations of local color without the least of that exaggeration of local tint which is so tempting under the circumstances, makes these two little drawings very valuable lessons to our younger water-color painters who want to see how the best out-of-door qualities may be got without loss of freshness and purity of tint. Charles Harry Eaton contributes some excellent drawings sharing these good realistic qualities: silvery greens and well-balanced sunlight and shadow, with a good perception of the better qualities of pictorial landscape. Nos. 442 and 633 especially are successful transcripts of nature—solid in color and sincere in execution. "A Pack Train," by Hamilton Hamilton, has excellent qualities of color—the brilliant foliage of the large group of trees in shadow against a burst of sunlight in the distance showing a very true eye for color and a good method of execution. "The Harvest Field," No. 438, by the same painter, has some excellent qualities of character in the figures and of bright sunny color in the landscape, but lacks breadth, and fails in producing the forcible impression which, with the same materials, a larger method of treatment would have insured.

In realistic color, an admirable study of Harry Fenn, No. 304, "A Pennsylvania Bee Colony," is very vivid. The light on brilliant local color i rendered with an extreme felicity, and the pictorial treatment of the subject is delightful. Mr. George Smillie contributes two pleasant drawings, Nos. 1 and 455, and James Smillie, a roadside composition, No. 465, which to our mind would be improved in its general effect by cutting off three inches of the near foreground. "At Watermills," by Bricher, is a solid, effective drawing, the value of the foreground being ingeniously but honestly given. A "Winter Evening in New Jersey," by Mr. McCord, is a very successful rendering of a not easy effect: the snow in shadow of twilight, against a bright evening sky. Two drawings by the late A. F. Bellows well represent a genial, gentle artist in a vein of landscape in which he was entirely at home. Hardly to be classed with landscape, and yet with an excellent landscape surrounding, is

Leon Moran's "The Outpost, 1776," subtle in drawing and color: a young vidette on horseback, watching intently; horse and man well characterized, and with a picturesque setting in the old-time costume.

Several drawings by Mr. C. A. Platt show great executive ability, and an excellent *coup d'œil*, with keen feeling for color in the gray and mingled tints of old architecture and seacoast bits. "Bruges," No. 137, is particularly happy. Harry Chase's marine subjects have that bright "papery" quality so much beloved by one class of water-color painters, of whom the type was George Tripp, the English watercolorist of years gone by—the purity of tint got only by leaving the wash pretty much as the first intention realized it; and Arthur Quartley is, with more dash and less justice in his tones, "in the same boat." Mr. Monks, in some admirable sheep studies, makes his really good landscape surroundings quite accessory to studies of the woolly tribe which, in their knowledge of the animal, quite rival Jacque. No. 7, "Autumn Pasture," is full of promise as well as ability. Mr. Monks has clearly found his walk. F. Hopkinson Smith contributes several important drawings, most of them rapid studies from nature—if the canals of Venice may be classed with nature subjects—of which No. 51, a group of lighters in a canal of the sea-city, is to our mind the best, its water-painting giving with uncommon justice the interlacing reflections of the sails and sky with the local color of the water. The best of his drawings as a whole, however, we must consider his brook scene, No. 78. The quality one gets in out of-door work is all very well for study, and admirable oftentimes as nature, but, unless supplemented by in-door *labor limæ*, never reaches consummate art. Among the marines we must not neglect an excellent study of light on moving water in No. 55, "After the Shower," by Mr. Rehn, where the effect of the sunburst is very truly given. The shadow of the sail is not, however, true—it is not, as it ought to be, a mere interference with the reflection of the sun on the waves, but a shadow, and clear water takes no shadow.

In the corridor are hidden many drawings, of which scarcely any can be judged, from want of light. There is a large group of flower studies, of which most are little better than splashes of color, "Chrysanthemum," No. 499, being the only thoroughly studied drawing among them. A lover of flowers should feel something more in them than is seen in most of these studies—the delicacy, the subtlety of color, fragility, and something of the specific character. In the East Gallery hangs a noble flower piece, No. 248, "A Brimming Bowl," by Agnes D. Abbott, which merits the place apart given it. It has the double excellence of happy arrangement and sincere and skilful rendering of the best qualities of the flowers, with thoroughly good painting.

We have inadvertently passed over the marines of Mr. Edward Moran, which are as far as they go thoroughly good (but more is in the sea than he has yet caught out of it), and the "White Study" of Ross Turner, No. 278—a weird and effective, if slight, record of a picturesque moment in modern Venice invaded by steam.

"The story of Washington's life as it might be told to a family circle by a grave, wise, witty man, familiar with the subject and able to talk."

So says Judge Tourgée's paper, "The Continent," of

George Washington (1732-1799),

By JOHN HABBERTON,

Author of 'Helen's Babies,' &c. No. 4 in the series of "Lives of American Worthies." 16mo, $1.25.

HENRY HOLT & CO., New York.

English Books.

DUTY PAID AT 33 CTS. TO THE SHILLING.

Duty being now collected on all Foreign books coming by mail, causing delay and annoyance, we beg to offer our services to book-buyers for the importation of Foreign books, from England as well as France and Germany, in weekly shipments, having the best facilities and over thirty years experience.

Parties preferring, however, to have Books or Periodicals sent by direct mail, can have their orders attended to, at original prices, through our house by having their addresses registered at our London, Paris, and Leipzig agencies. This will simplify accounts, save foreign correspondence, and the unpleasant experiences with foreign agents.

Our Monthly Book-Lists (English, German, French) are mailed to any address for 12 cts. a year each for postage.

English and other second-hand books. Book Catalogues mailed on application.

838 Broadway, New York.

JUST PUBLISHED:

PRUSIAS:

A Romance of Ancient Rome under the Republic. By Ernst Eckstein, author of 'Quintus Claudius.' Authorized Edition. In Two Volumes.

Price, paper covers, $1.00; cloth binding, $1.75.

WILLIAM S. GOTTSBERGER, Publisher,
11 Murray Street, New York.

By the Author of 'Kismet.'

VESTIGIA.

A Novel. By GEORGE FLEMING, author of "Kismet," etc. 16mo. Cloth. Price, $1 25.

"Vestigia" is the title of the new novel by the author of "Kismet," "Mirage," and "The Head of Medusa." "George Fleming," the *nom de plume* of this well-known writer, has given us in "Vestigia" a work of real power. The title is a part of the Latin proverb, *Vestigia nulla retrorsum*—no steps backward—which is the *motif* of the story.

TREASURE ISLAND.

By ROBERT LOUIS STEVENSON. With illustrations by F. T. Merrill. 16mo. Cloth. Price, $1 25.

"Any one who has read 'The New Arabian Nights' will recognize at once Mr. Stevenson's qualifications for telling a good buccaneer story. 'Treasure Island' is a real work of art, and at the same time so exciting that once begun it will be difficult to lay it down before the last page is reached."

OLD LADY MARY.

A Story of The Seen and The Unseen. Uniform with "A Little Pilgrim." Price, 75c.

The author of "A Little Pilgrim," in this new story, pursues the same subject which made that book so remarkable.

Our publications are for sale by all booksellers, or they will be mailed, postpaid, on receipt of price, by the publishers.

No Southern writer has given us so large or so valuable a store of historical matter and interpretative criticism as is contained in these two volumes.—N. Y. TRIBUNE, Feb. 1, 1884.

General Beauregard's Military Operations.

The Military Operations of General Beauregard in the War between the States, 1861 to 1865; including a brief Personal Sketch and a Narrative of his Services in the War with Mexico, 1846-8. By Judge ALFRED ROMAN, formerly Colonel of the 18th Louisiana Volunteers, afterwards Aide-de-Camp and Inspector-General on the Staff of General Beauregard. In Two Volumes. 8vo, Cloth, over 600 pages each. Prices per vol.: Cloth, $3.50; Sheep, $4.50; Half Morocco, $5.50; Full Morocco, $7.50—payable on delivery.

The book is in essence and effect an autobiography, and has that special value to the student which always attaches to the autobiographies of men of action who have [illegible] do with important historical events. . . . [illegible]ntribution to the history of the war, the boo[illegible] really invaluable. . . . Frankly Southern in its point of view, it nowhere offends by the employment of harsh epithets or by forgetfulness of the courtesy due to adversaries. . . . No Southern writer has given us so large or so valuable a store of historical matter and interpretative criticism as is contained in these two volumes.—*N. Y. Tribune.*

The work has been prepared at leisure and with the utmost deliberation. . . . So far as strength of support by documentary evidence is concerned, it is unique among works of its class relating to the Civil War. . . . A singularly vivid and picturesque presentation of some of the leading events of the war. . . . Merely as a mine of materials for historical investigation, the book is one to be glad of. It sets at rest a good many questions of fact which have hitherto been unsolved and seemingly insoluble. It corrects a good many errors by means which leave no occasion for doubt or question—*N. Y. Times.*

Copy of a letter from Mr. CHARLES A. DANA to General BEAUREGARD.

It is, in my judgment, a very valuable and important work. It sets forth many facts hitherto unknown or unappreciated. It sheds new and valuable light on some controverted questions; and it narrates in a simple, unaffected, easy, and engaging style the story of the most important facts of the great struggle. It is especially worthy of commendation for the moderation and freedom from excitement with which it discusses points that have been the subjects of embittered disputes in the hands of other writers. While the view of the author is powerfully maintained and fortified by unquestionable documents, I have not found anywhere an angry word or an undignified rejoinder. In this respect the book seems to me worthy of the highest praise.

SOLD BY SUBSCRIPTION ONLY.

In places where there is no agent for the work, application should be made direct to the publishers, who will send it by mail, postage prepaid, to any part of the United States, on receipt of the price.

Published by HARPER & BROS., New York.

Houghton, Mifflin & Co.'s

NEW BOOKS.

An Historical Sketch of Sacerdotal Celibacy in the Christian Church.

By Henry C. Lea. Second edition, considerably enlarged. In a large and handsome octavo volume of 682 pp., cloth, $4.50.

For this edition Mr. Lea has rewritten the first two and the last sections of the former edition, and has made numerous changes and additions throughout. To accommodate as far as possible this new matter, the size of the page has been increased, while the foot-notes have been reduced by the omission of all extracts which merely verified without illustrating the text. Nothwithstanding this, the volume has been increased by nearly a hundred pages.

Due West;

or Round the World in Ten Months. By Maturin M. Ballou, Editor of "A Treasury of Thought," etc. 1 vol. 12mo, $1.50.

Last year Mr. Ballou made the grand tour of the world, going continually westward. His route included, besides America, the Sandwich Islands, Japan, China, India, Arabia, Egypt, [illegible] and Europe generally; and his observations and comments on the wide variety of characters and customs that he encountered form a book which will both inform and entertain the multitudes who enjoy good volumes of travel.

Modern Classics.

No. 33. Containing selections from Dr. Holmes's Breakfast-Table Series, and Pages From an Old Volume of Life. 32mo, 75 cents; School Edition, 40 cents.

A delightful little volume, admirably adapted to school use, for which it was prepared, and no less attractive to the general reader, who knows how wise and witty is Dr Holmes's prose.

The Andover Review

NO. 2, FOR FEBRUARY,

The Nation.

NEW YORK, THURSDAY, FEBRUARY 21, 1884.

The Week.

THE story of the Berlin correspondent of the London *Times*, that Prince Bismarck had returned the Congressional resolution of condolence over Herr Lasker's death, has been confirmed. Bismarck is not a well-mannered man, but we believe it will be found on examination that he never hitherto has publicly insulted anybody gratuitously or without an object. He has made much use of publicly insulting language in his remarkable career, but always when he wished either to drive somebody out of office, or produce a diplomatic complication. If Lasker were still living and a power, however small, in German politics, we should be quite prepared to see Bismarck insult or snub even the American Congress, if he wished to discredit him, or express his contempt for him. But Lasker is dead, and before he died had ceased to be formidable to the Government, and in fact was at the time of his death only the shadow of a great name—the wreck of a man who had played a part in German politics of which, as an intellectual feat simply, any German might be proud, and Bismarck is a very good German. Moreover, he knows enough of Congress to know how readily resolutions like these are voted, and how little acquaintance the bulk of the members possess with foreign politics, and, therefore, how unnecessary it is to take them in bad part. His present performance appears to be universally condemned both at home and abroad, and it remains thus far inexplicable. We are, it would appear, however, to have an explanation of it from himself, and must wait for that before discussing it more fully. It is reported that he bases his action on "high political principles," but, until he is heard from, the world will incline to the belief that it is based on sciatica, or some form of the indigestion from which his friends and admirers have heard with so much regret that he has of late been a sufferer.

There has been no material improvement in business during the past week, although symptoms of the usual stirrings of spring trade have been felt here and there. The floods in the Ohio Valley have caused enormous losses to the agricultural, manufacturing, and mining interests within sweep of the waters, although resulting in very little loss of life considering the magnitude of the calamity. The demand for iron, which is a fairly good index of the state of trade, is steady at the reduced output, but cannot be said to be increasing. It is probably safe to say that changes from this time forward must be for the better. The demand for cotton goods shows some slight improvement. The indications are that "hard pan" has been reached in this trade also. Business failures for the week are reported by Bradstreet at 243 in number, being 14 less than the previous week, and 22 more than the corresponding week of last year. It is noticeable, however, that the average liabilities to each failure are small, 82 per cent. being traders whose capital was under $5,000. Business at the Stock Exchange has been entirely under the control of "manipulators." This means that there has been no such thing as a market dependent upon supply and demand in the larger sense, but that prices have been marked up and down at the instance of the large speculators. Such market as there was might be denominated a bull market, but only in the sense that the bears appear to be willing to see a higher range of prices established before "getting on top of it" again. Sterling exchange advanced to the specie-shipping point one day, and remains close to that point now, but no gold has been actually exported—or none worth mentioning.

The bill under discussion in the Senate to amend the National Banking law so that circulating notes may be issued up to the par value of the bonds deposited, is an improvement on the existing law, which limits such circulation to 90 per cent. of the par value, yet it is doubtful whether this amendment will suffice to check the retirement of bank circulation as the 3 per cent. bonds are called in and redeemed. Further relief might easily be granted by repealing the tax on bank circulation in whole or in part, yet this is one of the things which Congressmen are unaccountably reluctant to do. While everybody is crying out for measures to lessen the public revenue, it is found in practice that there is no place to begin. You must not touch the tariff, because the interests of protected manufacturers, or wool growers, or copper miners, or sugar planters, or wood choppers will suffer. You must not reduce the bank tax, because the "note shavers" will gain by it. You must not reduce the tax on whiskey and tobacco, because they are articles of vice and luxury, and so on. The last is a perfectly valid reason for maintaining existing taxes, and because it is so there is all the more reason for getting rid of superfluous duties and imposts on other things. The tax on bank circulation is absolutely needless for purposes of revenue, and while it is proper and just to retain it if the banks derive undue profits from their circulation—while it would be proper to retain it under such conditions even if the Government needed no revenue—yet, with the prospect before us of a bank contraction equal to $60,000,000 per year, it seems quite unaccountable that Congressmen should be so opposed to any diminution of the tax.

Senator Hawley says the Republican Executive Congressional Committee is thoroughly determined to live up to the letter of the Civil Service law, which forbids anybody in the pay of the Government to receive or solicit money or contributions for political purposes. He thinks it would be well also to have State Committees so constituted as not to include office-holders. We trust that these intentions will be strictly carried out. If they are, we have not the least doubt that the gain in moral force to the Republican Presidential ticket will fully equal whatever loss may be sustained through the absence of the campaign funds which have hitherto been wrung mainly from the office-holders. Nothing is clearer than that the usefulness of large campaign funds has been greatly overestimated. In the campaign in this State last November there were no efforts to collect such a fund by the usual assessment methods, and there were many sarcastic comments by the Machine leaders on the excessive virtue of civil-service reformers "who were unwilling that the office-holders should contribute, but who refrained from giving anything themselves." To the great astonishment of these persons, the election showed such Republican gains that a Democratic majority of nearly 200,000 in the previous year was nearly obliterated. There had been no canvassing, few or no documents, and little money, yet the people had voted with unusual spirit and intelligence.

Mahone's last hope of regaining control in Virginia has been destroyed by the action of the Legislature in relation to the election machinery of the State. A bill has been passed over the Governor's veto which takes from the county judges the power of appointing election officers, and gives it to local boards which are to be selected by the Legislature. There is no requirement that the local boards shall select the officers from both political parties, so that the election will in all probability be entirely within the supervision of Democrats. The law goes into effect on April 1, and the Presidential election this year will therefore be held under it. Mahone's entire system, which in many respects was scarcely less partisan than this, has been abolished, and with it has gone all chance for him and his party to make a formidable show in the election. The State is probably more completely in the power of the Democrats than it was before Mahone appeared as a leader. His methods, instead of liberalizing public sentiment, have furnished seeming justification for the most extreme Bourbon hatred of Republican influences, and have thus made it easier than ever to enact laws which will perpetuate Bourbon control. The situation in the State is about as bad as it can be, and the only pleasant feature of it is that the Republicans of the country will be spared the spectacle of Mahone appearing at their National Convention with the electoral vote of Virginia, and offering it for sale to the highest bidder.

The Illinois Republican State Committee held a meeting in Chicago on Wednesday, and a canvass of its members revealed a strength for Logan which is hailed as an indication that he will "sweep Illinois like a hurricane." So many were found to be in his favor that it was claimed that he was sure to have thirty-five and possibly forty-one of the State's delegates to the National Convention. As there will be only forty-four delegates, this will be a handsome majority. Not many reasons were given for this flattering support, but the Senator's gallant fight against Fitz-John Porter was universally regarded as constituting an all-suffi-

cient issue. This canvass strikes us as giving the Logan boom a powerful impetus, and we shall be very much surprised if some demonstration is not made by Mr. Blaine's friends to counteract it. A fresh bulletin about the exact condition of the "historical work" at this moment, coupled with a declaration that Mr. Blaine will under no circumstances consent to be a candidate, because it would break up his practice of going to bed at 9:30, would undoubtedly have a powerful effect.

The verdict of the *Proteus* Court of Inquiry places the blame for the bad management of the Greely Relief Expedition mainly upon General Hazen, of the Signal Service. The court is of the opinion that while he had the best intentions, "in many particulars, and in some of the gravest moment, he failed in an adequate comprehension of the necessities of the case, and of the measures and means essential to meet them." This coincides with the view of all impartial persons who have followed the developments of the inquiry. A more recklessly mismanaged expedition than this one was it would be difficult to conceive. It is to be hoped that in sending out the second one, as now proposed, General Hazen will be allowed to have nothing whatever to do with the arrangements. The court of inquiry, while blaming him, leniently exonerates him from "wilful neglect or intentional dereliction of duty," and, after mature deliberation, concludes that no further proceedings before a general court-martial are called for. The least punishment which can be accorded him is a refusal to allow him to have any official control over future expeditions.

Mr. Babb, an Iowa legislator, has forwarded us a copy of a joint resolution he has introduced in the Legislature of his State on the subject of divorce. It declares our present system one of "legalized polygamy," and adds that the trouble mainly grows out of the "diverse systems of procedure and causes of divorce" in the different States. Further, it declares reform by constitutional amendment to be impracticable, and that "the only practical method of procuring the desired uniformity of action on this subject, as well as on laws pertaining to mercantile paper, methods of conveyancing, and other subjects upon which such uniformity is so necessary to the good of the common whole, is by concert of action on the part of the several States and Territories themselves." Therefore, it directs the Governor of Iowa to call for a general convention of States and Territories (each to send two representatives), to be held at the capital of Iowa a year from next May, to take all these subjects into consideration, and to recommend suitable legislation to the various States.

When the convention meets, if it ever does meet, it will apparently, by the terms of the resolution, be precluded from recommending any constitutional amendment on the subject. We would suggest to Mr. Babb that this is unwise. The study of our institutions has no doubt made him familiar with the fact that even the Constitution of the United States was the result of a movement started by a convention of a few States, called to consider the necessity of a uniform commercial system; and that in those early days there were conservatives who dreaded, just as he does now, any change in the fundamental law. Yet it was found, as Bancroft and other historians have shown, that uniformity could not be obtained without a new Constitution. This was felt to be a dreadful step toward centralization, and yet we have survived it, and so it is possible that we might survive a change giving Congress the right to pass a uniform law, at least on the subject of marriage and divorce. Is it wise, we would ask Mr. Babb, in the light of history, absolutely to preclude his convention from considering whether a constitutional amendment would not be better than the plan of giving advice to State Legislatures?

Our Japanese contemporary, the *Jiyu Shimbun*, commenting on the treatment of the Chinese by the United States Government, quotes the suggestion of the *Nation* that the only way to make the law for their exclusion really efficacious is to "authorize the summary slaughter of all Chinamen found within the country after a certain date, and to offer a reward for the heads of all Chinamen caught after another still later date," and that "in no other way can our Christianity be saved from the debasing influence of these heathen." The *Jiyu Shimbun* is much shocked by this, and though "it does not believe that the Government will adopt such a plan, its being publicly urged strikes it with astonishment." Not satisfied with prohibiting the entry of the Mongolian race on their territory, the Americans, says our contemporary, "clamor for the expulsion of the Celestials by the most murderous measures." All this shows how necessary a knowledge of foreign manners is to the proper understanding of foreign figures of speech. The editor of the *Jiyu Shimbun*, without knowing how rare wholesale slaughter of foreigners was among us, could of course see nothing ironical in the suggestion that Chinamen found among us should be slaughtered. But he may have been reading accounts of "family feuds" in the Southern papers, and been thus prepared to consider "murderous measures" a favorite American solution of troubles of one sort or another.

Mr. Thomas's bill to prevent stock-watering was discussed in the State Senate on Thursday. We believe it passed the Senate last year, and it is a very stringent measure. It prevents the issue or sale of any part of the stock of any corporation "until the nominal (par) value . . . shall have been paid in money into such corporation." By another section every corporation is obliged to keep its share-list open to inspection by shareholders, the Attorney-General, in person or by proxy, or, in the case of railroads, by the Railway Commissioners. Any violation of the law is made punishable by fine and imprisonment. The second of the provisions seems a very good one, but the first is open to serious objection. In all legislation hitherto designed to prevent stock-watering the company has been allowed to represent, not only money, but money's worth, in the shape of plant, land, etc., by stock. However wicked it may be to water stock, no one has ever insisted before that everything except greenbacks or coin is water. "Water" does not mean everything not money, but merely fictitious value of any kind, as where a corporate stock is suddenly doubled in order to make it appear that the profits are half what they are really. There is probably not a single corporation in the State where the stock only represents "money."

The Half-Breeds in the Newman church, who have with them, we believe, five of the nine deacons, tried to hold a meeting in the church on Thursday night, but the Stalwarts were too smart for them, having had the doors locked with new locks. They then adjourned to a "hall," and formally dismissed Dr. Newman, and arranged for the calling of a Congregational Council. The Stalwarts formed a camp of observation in a neighboring private parlor, and had ice cream, while scouts brought in frequent reports of the Half-Breed doings, which were freely denounced and declared null and void. Both parties are evidently moving rapidly towards a law suit in the secular courts. Dr. Newman is still armed with that $100,000 legacy, but, as we understand the matter, the testator is still living, so that he can only hold it over the heads of the enemy as a remote terror. It would not be a bad plan for the Half-Breeds to meet this by getting some of their number to make a will too, and leave Dr. Ranney half a million or so for the church in case Dr. Newman was made to go.

The Rev. James Finch, A. M., has come to the rescue of the *Christian at Work* in its trouble about murder for revenge, with a little device which he calls "Goelism." "Goelism," he says, "is from the Hebrew goel, and it means the doctrine that the nearest relative of the person murdered has the right and that it is his duty to avenge his kinsman's death.'" Goelism in process of time, it appears, "merged into legalism"; that is, the duty of killing the murderers of relatives was transferred to the magistrate. Now listen to Mr. Finch in his own words, and remember that he is a Christian minister and an A. M.:

"Now the Mosaic legislation, which has the element of goelism in it, was, of course, in part, for a rude age. As soon as civilization had sufficiently advanced to admit of the administration of public justice through the forms of law, the primitive mode of administering justice by goelism would naturally be of less frequent occurrence. But the principle of administration in either case was, and is, the same, viz., the security of the person in his rights and possessions. The mere forms of law make nothing right; if right can be secured through them, it is well; but if not, the law of nature—the law of the common consciousness—declares that *rights may be secured even by a near kinsman's becoming a homicide*—a GOEL—an avenger of blood.

"Here is the proper ground for the justification of young Nutt. Cloudy as men may be with respect to their reasons, argue as they may with respect to the obligations of statute laws, probably ninety-nine out of a hundred justify the homicide. It is not that they are lawless men, nor that they favor lawlessness;

but the law having failed of its end, viz., the security of the individual and society, it is felt to be the right thing for the 'avenger of blood' to slay the monster of wickedness."

The richest thing in the foregoing is that a man of education should gravely assume that "Goelism" is an exclusively Jewish "doctrine," and should not know that it was and is the doctrine of all barbarous tribes, and that he should hold that it can, in our time in Christendom, be revived by anybody who thinks that in a particular case the courts have not done him justice. "Goelism" exists in Afghanistan to-day, in its original form. Afghan soldiers in the British army have been known to ask for furlough to go home to kill somebody who had slain a relative, as a solemn family duty. Nutt might just as well look for his justification in Cabul as in Jerusalem. We advised the *Christian at Work* some weeks ago to take a vacation. We venture to offer Mr. Finch, A.M., the same suggestion, in the hope that a little rest and refreshment will bring him saner notions of law and morality.

The sequel to the Conkling-Haverstick murder is very curious. Conkling, it will be remembered, murdered Haverstick because the two had a quarrel about the former's sister. The murderer was released on bail. His sister, who was the only witness to the shooting, could not be found, probably because she was not looked for. She has now died, and her character may be inferred from the fact that her husband, Mr. Uhler, was at first undecided whether to have her buried or not. A pastor, named Wedekind, was found to preach a funeral sermon over her, however, in the course of which he referred incidentally to "the brother," who, while he had "nobly endeavored to avenge his family," committed a crime which "can only be expiated through faith in the atoning blood of Jesus Christ." This latter statement happened to be perfectly true, though for a reason that the pastor forgot to mention—that the only witness to the crime is dead. Otherwise it might have been expiated, humanly speaking, with more efficiency, by incarceration or hanging. The idea of Conkling as a noble "avenger" is evidently deduced from the doctrine of "Goelism," though its appearance in a funeral sermon in a Christian church is rather alarming.

The difficulty in finding an editor for the London *Times* is an illustration of the seriousness of the change which the disappearance of the anonymous system has wrought in the conditions under which that journal is published. In the days when it made its fame, the editor was unknown outside the office, and his death was a matter of little consequence, and it might have run on for weeks or months without an editor-in-chief. Since Mr. Delane broke through the veil, and made the editor a personage known in society and at the clubs, the proprietors have to provide somebody of note, who will make a good figure in the editorial chair, whether he be a good editor or not. This, as they have found since Delane's death, is no easy matter, and it will probably become harder every year. Moreover, it is plainer every day that if the paper is to hold its own against the tremendous competition to which it is now exposed, the style of writing in it will have to undergo very serious changes. The conductors have stuck manfully for a century to the solemn, magniloquent, and diffuse manner of political discussion of which Junius set the model, but which constantly leads, in all but master hands, to vapidity and feebleness. To abandon it now, for the more incisive, condensed, and vigorous talk which the best editorial writing aims to be, will be no easy task, and will have to be superintended by a kind of man who is not to be had for advertising. If tried unsuccessfully, the consequence to the *Times* as property might be very disastrous. The paper probably suffers now more than anything else, however, from having in the background a feeble, pompous, and meddlesome proprietor, who wants to be made a peer.

General Gordon has begun the work of reform in the Sudan in characteristic fashion, but in a fashion which will put the English Conservatives in a very awkward position. He has become a hero with them since he started for Khartum, and they were making liberal use of him to denounce Gladstone. He ought, they said, to have been sent sooner, and it was horrible to send him now without an adequate force; but when they began saying this, they were under the impression that he was going up there to fight, and was not to make peace till the rebels were brought to their knees. This was the course they advocated after the checks received from the Boers in South Africa. They are probably, therefore, terribly disgusted now with Gordon's proclamation acknowledging the Mahdi's sovereignty, and with his general reinstatement of the native chiefs. This is, in fact, simply the execution of the ministerial policy from the beginning. The one thing for either England or Egypt to do in the Sudan is to give up all attempt to rule it, and take out of it the gang of Turks and Circassians who have been desolating it for some years. To the argument that this will lead to a revival of the slave trade, the answer is that, the attempt to hold the country having failed, the slave trade must be suppressed by other means than conquest. A more vigorous blockade of the Red Sea coast, and a better government of the territory around Khartum, which can be really held, will probably do the work. General Gordon's declaration that he has nothing now to say to the slave trade, undoubtedly means simply that it is no part of his present mission to deal with it. His work is simply to hand the country over to its rightful rulers, and get the Egyptian garrisons out of it.

Under these circumstances, there seems nothing left for the Tories but to turn to and denounce Gordon for sacrificing the honor of England. They cannot well accuse him of pusillanimity, but he certainly seems to be no more audacious in defence of England's honor than Gladstone himself. The mutiny of the Egyptian troops at Cairo gives a touch of the comic to an otherwise very tragic situation. It does not appear to amount to very much, but the pretence that they cannot serve under the British officers because these are aliens in race and religion, is very droll. The real reason they dislike them is probably that they expect Egyptians to fight, and propose taking them into places where they may be hurt or killed. Probably the best thing to do with the Egyptian army would be, as is suggested, to disband it. An army that will not fight is probably the most indefensible luxury a poor country can have.

The Mahdi, on his part, is doing little to justify the predictions of his admirers. He is obstinately slow in moving. Three months ago the *Sun* represented him as likely to make far-reaching conquests like those of the early Caliphs. The London *Spectator* promised on his behalf that by the beginning of January he would have set the whole Mussulman world in a flame, and that the French would be fighting for their lives along the whole North African coast. General Stone, who is very hostile to the English invaders of Egypt, has now arranged an advance on Lower Egypt for the Mahdi, by a "western route through the oases" (which it seems "the British, in their terror, have forgotten") northward to the Mediterranean coast region. In other words, he is to march a conquering army, which will be capable of driving European forces out of Egypt, across the Libyan desert on a route which barely supplies water for commercial caravans. One does not need to discuss such hypotheses, even when they come from as good an authority as General Stone. What prevents the Mahdi from leaving the Sudan is what prevents his enemies from getting at him in the Sudan—the difficulty of moving masses of men across the desert.

An "Anarchist" named Cyvoct, recently extradited from Belgium to France, has been condemned to death at Lyons. The treaty between the two countries provides that the offence for which punishment is inflicted must be criminal by the laws of both. Cyvoct had started his movement for the regeneration of mankind by indirectly blowing up a restaurant by "artifices and manœuvres or by instructions." For this, and for "assassination," he was indicted, assassination being a treaty crime, but the indirect explosion of restaurants not being anything of the sort. On the charge of assassination he escaped; on the other count he was found guilty. He appealed to the courts, but they have now decided that they have nothing to do with the matter—that extradition treaties are administrative acts, and prisoners cannot claim the benefit of them as a matter of right. Cyvoct will therefore be hung, unless the President of the Republic pardons him. The case illustrates in a striking way the difference between French and American law. Yet it is only a few years since the attempt was made in the courts in New York to set up this French doctrine, and to deprive prisoners of their right to a trial in accordance with the provisions of the treaty.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, February 13, to TUESDAY, February 19, 1884, inclusive.]

DOMESTIC.

THE *Proteus* Court of Inquiry, in its report, places the blame for the failure of the Greely Relief Expedition principally on the Chief Signal Officer, General Hazen, because he did not take the proper preliminary steps or give proper directions.

Secretary Chandler has selected Commander W. S. Schley to command the new Greely Relief Expedition. He is forty-four years of age, and has never been on the sick list since he entered the service in 1856.

The House of Representatives on Wednesday considered the Mississippi contested election case of Chalmers against Manning. Mr. Turner (Dem., Ga.), Chairman of the Committee on Elections, spoke in support of the majority report, which declared that on a prima-facie case neither of the contestants was entitled to the seat. Neither the majority nor minority report is signed, but Mr. Turner stated that ten of the members of the Committee were in favor of the former, while only five supported the latter. After several days' debate the majority report was adopted on Friday.

The House on Monday passed a bill fixing the postage on transient newspapers at one cent for four ounces.

There was an all-night session of the House, lasting from Monday night till Tuesday morning at nine o'clock. There was a deadlock, owing to the fact that the Republicans declined to vote on a motion to fix February 21st for the consideration of the bill to pension Mexican veterans and the survivors of some Indian wars. The Republicans felt themselves called upon to protest, by withholding their votes, against a bill which proposes not only to pension the veterans of the Mexican war, but any person who may have served no longer than thirty days in the Creek war or disturbances. The Republican theory was that the Democrats, if they desired to enter upon such legislation as that, must secure a quorum of their own number to do so. Mr. Hiscock made a severe speech arraigning the Democrats, which created great excitement. The latter finally secured a quorum, and passed the resolution.

In the House on Monday Mr. Harrison (Rep., Ind.) introduced a bill for the admission of the State of Dakota into the Union. It was referred to the Committee on Territories.

The investigation of the Danville, Va., election riots was begun in Washington by the Senate Sub Committee on Thursday. Several negroes testified as to the aggression of the whites and the shooting on that day. They also said that in consequence they had been intimidated from voting. The white witnesses testified generally as to the insolence of the negroes and their intention to put a stop to it. They made rather frank admissions as to their actions on the day of the riot. The hearing was continued on Friday, on Monday, and on Tuesday.

Absalom Koiner, a member of the Virginia Senate, submitted to that body on Monday a proposition asking Virginia's Congressmen "to bring to the attention of the National Government the propriety or the necessity of providing a territorial reservation for the exclusive use and local government of such of the negro race of the United States as may prefer negro population and local negro government to demonstrate their capacity of self-government." It went over under the rules.

Governor Hoadly, of Ohio, has written to Speaker Carlisle urging the restoration of the duty on wool.

At Albany, in the Senate, on Wednesday, the bill abolishing the State paper was ordered to a third reading by a vote of 14 to 10.

In the Assembly a resolution was debated directing the Committee on State Charitable Institutions to investigate the cause of the recent death of Evan D. Hughes while confined in the Utica Insane Asylum. Mr. Burns (Dem.) declared that the institution was a great political machine used by both parties. It made or unmade politicians. The resolution was amended so as to provide for a Special Committee of Five, and was then passed. The Chairman of the Committee on Ways and Means submitted the annual appropriation bill, the total of which is about $7,000,000, or $200,000 in excess of last year.

The Prohibition Amendment was again debated vigorously in the Assembly on Thursday and was ordered to a third reading. The bill reducing pilotage fees at New York was also advanced to a third reading.

The widow of Theodore Roosevelt, the well-known philanthropist of this city, and the wife of her son, Theodore Roosevelt, jr., the Republican Assemblyman, died in this city on Thursday. The New York Assembly adjourned on Friday out of regard to Mr. Roosevelt, after passing resolutions of condolence.

A mass-meeting was held at Cooper Institute on Thursday evening, at which resolutions were adopted appointing a committee of fifty prominent citizens of this city to visit Albany to secure the necessary legislation for the concentration of power in the hands of the Mayor for the appointment of municipal officers without the approval of the Aldermen. Speeches were made in favor of the project by William M. Evarts, Judge Noah Davis, and others.

The Assembly on Monday evening disagreed to an adverse report on the bill extending the five-cent hours on the elevated railroads of this city. On Tuesday they passed the General Appropriation Bill. During a debate on that day Mr. Hooley (Labor member) said the State paid a large amount to the humbug known as the Civil Service Commission, which only existed for the purpose of keeping many a good man out of office. Mr. Littlejohn (Rep.) entirely agreed with this view, pronouncing the Civil-Service Bureau not only useless, but one of the veriest humbugs in existence. This statement was greeted with warm applause.

The New York Republican Committee is called to meet at the Fifth Avenue Hotel in this city on March 4th to take action regarding the State Convention.

The Supreme Court of Illinois has affirmed the judgment of the lower Court in the case of Timm *vs.* Harrison, Mayor of Chicago, thereby asserting the constitutionality of the Harper High License law.

The high waters began to subside on Saturday, and railway traffic was resumed on a number of roads leading into Cincinnati on Monday. There is wide-spread distress in many places, along the Ohio River, which the Government is endeavoring to relieve with its appropriation. Subscriptions of money and collections of clothing have been made in all parts of the country, those from the South being noticeable.

There was an almost general resumption of work this week in the iron mills, glass factories, and river coal mines around Pittsburgh. Many thousand men were given employment.

The Senior class of Hamilton College, Clinton, N. Y., left the institution in a body on Friday because the Faculty had suspended two of their members, leaders in a general college "bolt" of recitations on the day preceding the funeral of ex-President North.

The Harvard Faculty and the Princeton Trustees have adopted the stringent resolutions for the regulation of inter-collegiate sports which were recommended by the late conference of college faculties on the subject. Five colleges must adopt them to make them binding.

In the suit brought by L. L. Nightingale, one of the characters in the novel, 'Cape Cod Folks,' against Alexander Williams, its publisher, in Boston, the jury on Thursday gave the plaintiff $1,095 damages.

The will of Wendell Phillips leaves his property, aggregating $250,000, to his widow, with a reversionary interest to his adopted daughter, Mrs. G. W. Smalley.

Professor S. Wells Williams, LL.D., of Yale College, died on Saturday after an illness of two weeks. He was seventy-two years of age. After being graduated at the Troy Polytechnic Institute he went to Canton, China, as printer to the American Board of Foreign Missions. He studied Chinese, and published a number of standard books on the subject. He was the editor for many years of the *Chinese Repository*. In 1842 he published 'Easy Lessons in Chinese.' He returned to the United States in 1845. In 1848 he published 'The Middle Kingdom,' a standard work on China, of which a new and carefully revised edition was published a few months ago. He returned to China in 1848. He resided there and in Japan for many following years, publishing valuable works, and holding office under the U.S. Government. In 1874 he brought out at Shanghai the great work of his life, 'The Syllabic Dictionary of the Chinese Language,' and in 1876 he returned to the United States, having been appointed lecturer on Chinese at Yale College, where he remained until his death. Prior to his last illness he had been an occasional contributor to the *Nation*.

FOREIGN.

Active preparations for British interference in the affairs of the Sudan were announced on Wednesday. Lord Wolseley, Adjutant-General of the British army, telegraphed to Lieutenant-General Stephenson, commanding the forces in Egypt, to collect a force for the relief of Tokar, if this was possible, and if not, for the defence of the Red Sea ports. General Graham took the supreme command of this force, with Colonel Buller in command of the infantry and Colonel Stewart of the cavalry. General Lord Wolseley ordered that the greatest publicity be given to the determination to relieve Tokar by British troops. A body of British troops was ordered to Suakim, and the British garrison at Alexandria was transferred to Cairo. The news of the despatch of British troops spread rapidly and had a good effect in tending to disperse the rebels.

General Gordon, with several powerful chiefs, left Berber on Wednesday for Khartum, proceeding very slowly, in order to negotiate with the people along the river. On his arrival at Khartum on Sunday thousands crowded to kiss his hands and feet, calling him "Sultan of the Sudan." Addressing the people General Gordon said: "I come without soldiers, but with God on my side, to redress evils. I will not fight with any weapons, but will mete out justice. There shall be no more Bashi-Bazouks." The populace say that General Gordon is giving them more than El Mahdi could give. His influence is so great that no fears are now felt for the safety of the garrison and the people at Khartum.

Colonel Coetlogon, Commander at Khartum, was on Saturday created Pasha and made acting Governor-General of the entire Sudan. He summoned the notables to meet General Gordon in council on Sunday.

General Gordon has posted a proclamation recognizing El Mahdi as Sultan of Kordofan, remitting half the taxes, and placing no restriction on the slave trade. The Arabs of Khartum express great satisfaction with it. The proclamation was sent to all the tribes. The London *Times* on Monday said that General Gordon's proclamation, as regards slavery, means that his present mission has nothing to do with slaves, and not that he desires to

encourage slavery. Mr. Gladstone, in the House of Commons, said that the appointment of El Mahdi as Sultan of Kordofan, and the remission of taxes, were within General Gordon's powers. The true meaning of the order regarding the slave trade could not be understood from the telegraphic summary which had been published. The Government preferred to await the receipt of the full text of the original order.

Papers were presented to Parliament on Thursday regarding General Gordon's mission in the Sudan. Among them were Sir Evelyn Baring's instructions to General Gordon with respect to the evacuation of the Sudan. General Gordon is given the fullest liberty to use his own discretion in the premises. One hundred thousand pounds have been placed to his credit, and additional funds will be granted if necessary.

General Gordon's memorandum of January 2, in which he unfolds his plan for restoring the petty Sultans to their ancestral power, leaving El Mahdi out of the calculation, is also among the papers. He advises that the arsenals be handed over to the various Sultans. His greatest difficulty will be in disposing of the arsenals at Khartum, Dongola, and Kassala, where there are no Sultans, because those places have sprung up since Mehemet's conquest. England has refused General Sir Evelyn Wood's proposal to sanction the coöperation of the Egyptian army in the relief of Tokar, for the reason that this army was raised for the defence of Egypt outside of the Sudan. England approves, however, of the despatch of the Egyptian battalion, which is furnished with English officers, to Assuan, if this proves necessary.

The orders governing the expedition for the relief of Tokar provide that the troops are to take with them provisions sufficient to last two weeks. They will bivouac upon the line of march. Each man will carry seventy rounds of ammunition in his pouch, and there is to be a reserved supply of 250 rounds per man. Official letters have been sent to Tokar urging the garrison to hold out until the troops arrive. If they succeed in relieving the town, the forts will be blown up and a retreat made to the Red Sea coast.

There was an unconfirmed rumor in Suakim on Monday night, brought by scouts from Trinkitat, to the effect that the rebels carried Tokar by storm on Sunday night and massacred the garrison. On Tuesday advices were received from Tokar that 200 of the garrison made a sortie, attacked the enemy, and killed and wounded several of them. They also captured a number of cattle and camels.

Osman Digma, the rebel leader, was reported on Sunday to be massing his troops near a defile where he defeated Tahir Pasha, on the road between Trinkitat and Tokar. If he fails to reduce the latter city before the arrival of the British troops, he will, it is said, give battle there. Orders have been given by the British Government to confine the British expedition to the relief of Tokar. It is expected that a decisive battle will be fought on February 24. The rebels fired on the forts at Suakim on Sunday. Baker Pasha had a narrow escape. The commander at Tokar has written that he has supplies to last him until the end of the month. He wants arms and ammunition.

Four Egyptian private soldiers presented to the Khedive on Saturday a protest against the despatch of Egyptian soldiers to the Sudan, and a demand for the removal of British military officers. General Wood was immediately sent for. He confronted the mutineers, and arrested them. The petition purported to be approved by the whole Egyptian army. Some correspondents considered the incident of grave import, while others said that it was trifling, and had not shaken the confidence of English officers in Egyptian troops. There were rumors that the Egyptian army was to be disbanded on account of its worthlessness, but they were not confirmed. The stripping of Alexandria and Cairo of British troops for the operations in the south has caused lively fears of an émeute.

It was reported in London on Wednesday that a majority of the Cabinet were urging more vigorous action in Egypt. Mr. Gladstone, Earl Granville, and some other members are opposed to increasing England's responsibility. Conservative meetings were held in many English towns on Wednesday night, in all of which the Government policy in Egypt was attacked. Confidence was expressed that Parliament would soon be dissolved, and the Conservatives would triumph at the next election. The London *Times* on Thursday rebuked the Conservatives for not boldly declaring their policy.

Mr. Gladstone said in the House of Commons on Thursday that Turkey had proposed an interchange of views regarding Egyptian affairs. Meanwhile the negotiations continue. The debate on the motion of censure was resumed. Sir Wilfrid Lawson, Radical, moved an amendment that the House decline to express an opinion of the Government's Egyptian policy. In proposing this amendment he said that he trusted that hereafter Englishmen would not be employed to interfere with the Egyptians in their selection of a Government. Mr. Labouchere, advanced Liberal, seconded it. Mr. Gladstone spoke in opposition. The debate was continued on Friday without special incident.

The debate on the motion to censure the Government for its Egyptian policy was resumed in the House of Commons on Monday. W. T. Marriott, a Liberal, made a violent attack upon the Government, accusing it of vacillation and inconsistency. The Irish Parliamentary party held a meeting in the evening to decide how to vote on the motion of censure. Mr. Parnell was absent. There was a disagreement as to the course to be pursued. Mr. Sexton moved to vote against the Government, which was carried. Mr. Parnell was present at another meeting of his party on Tuesday morning, and it was again decided to vote against the Government. The debate was concluded on Tuesday evening, and Sir Stafford Northcote's motion of censure was defeated by a vote of 311 to 262, a majority of 49 for the Government notwithstanding the opposition of the Parnellites.

Lord Randolph Churchill has been elected President of the National Conservative Union, which is considered an indication that he will take the place of Sir Stafford Northcote as Conservative leader in the House of Commons. The latter, it is said, is willing to accept a peerage.

Mr. Bradlaugh issued on Wednesday an address to the electors of Northampton for a reëlection. Mr. Richards, who once before gave him a close run, was the candidate of the Conservatives. Mr. Bradlaugh was returned on Tuesday by a larger vote than ever before, and will take the oath at once.

A bill was introduced in the House of Lords on Friday to afford better protection against the importation of diseased cattle.

While walking unattended to the House of Commons on Thursday, Mr. Gladstone was suddenly seized by the collar, and brought to a standstill by a man. With some difficulty he shook off his assailant. It is said the attack was made on a wager.

The Cobden Club will circulate 20,000 copies of the pamphlet by Mr. Giffen devoted to the "Progress of the Working Classes," which Mr. Gladstone pronounces to be the best answer to the doctrines proclaimed by Mr. Henry George.

The strike of the weavers has come to an end everywhere throughout East Lancashire, England.

At a meeting of the company of authors, established to obtain a copyright convention with the United States, which was held in London on Monday, Cardinal Manning spoke at some length upon the injustice done by American publishers in pirating English works. Mr. Walter Besant moved that a company of authors be founded in America, and that the matter be brought before American authors. The motion was carried.

Matthew Arnold will publish impressions of America, along with the lectures he delivered while in the United States.

Ten thousand copies of the first edition of Queen Victoria's Diary were sold the first day after publication.

Admiral Carr Glyn, who was legatee to the estate of Adelaide Neilson, the actress, is dead.

The Merv tribes have submitted to Russia. The German press says the submission of the tribes of Merv to Russia is worse for England than the disasters in the Sudan. It comments upon the remarkable success of the Russian policy in Central Asia, and says it is always directed against England. The Russian newspapers express the opinion that the submission of the Merv tribes to Russia, together with the events in the Sudan, insures the downfall of Mr. Gladstone.

The Lower House of the Austrian Reichsrath has passed the exceptional law directed against Anarchists by a vote of 177 to 137.

American affairs were brought into prominence in Germany on Thursday by an article in the Berlin *North German Gazette* (Bismarck's organ) in which it was said: "The bill in regard to hog products which is now before the American Congress is calculated painfully to affect Germans who have the national interests at heart. The sting of the bill is palpably directed against Germany alone. We do not assume that American statesmen are disposed to entertain the opinion that Germany can be induced by reprisals or threats to rescind measures enforced in the interest of public health. An independent Government can only reply to any attempt at intimidation by counter reprisals, consisting of increased customs duties, and eventually by legal measures otherwise affecting the intercourse of the two countries."

The Berlin correspondent of the London *Times* on Saturday reported that Prince Bismarck had returned to Herr von Eisendecher, the German Minister at Washington, the resolution of condolence on Herr Lasker's death passed by Congress, with the request to return the resolution to the House of Representatives, as the position of Herr Lasker in Germany was not such as to justify the resolution. The *Times* added that although the thing appears incredible, the fact is that the relations between Washington and Berlin are in a state of great tension, chiefly owing to the pork question. Later advices confirmed the report.

The commercial convention between the United States and Spain was signed in Madrid on Wednesday.

The Bey of Tunis has given M. Roudaire authority to carry out his scheme for transforming a portion of the Desert of Sahara into an inland sea.

Many Christians have been massacred in Anam since the beginning of January. The Anamite Minister of War is implicated.

Two mandarins who were instigators of the recent massacre of Christians in Tonquin have been taken to Hué, tried, and executed.

President Grévy on Tuesday received a telegram from the King of Anam. The King expresses the hope that the newly completed cable connecting Haiphong with Thuanan and Saigon will strengthen the friendly relations existing between France and Anam. He also trusts that the treaty will be ratified.

THE ALDERMEN AND THE APPOINTING POWER.

THE meeting at Cooper Union on Thursday last was a great success both in numbers and in enthusiasm; and it named an excellent committee to go to Albany to secure the passage of the Roosevelt bill and such other legislation as may be necessary to concentrate responsibility in the Mayor, and take away from the Aldermen their share of the appointing power. This change undoubtedly does not include the whole of municipal reform, but it promises more of it, in our belief, than anything else which this generation is likely to see accomplished. We have now had in this city about forty years' experience of the modern problem of governing great centres of population by universal suffrage. What the difficulties of this problem are is better known to New Yorkers to-day than to any people in the world. We have learnt all that the lowest tribe of demagogues ever seen in a civilized community can accomplish through a large body of ignorant voters. We have actually seen the creation among us, as Judge Davis forcibly pointed out, of an aristocracy or oligarchy of liquor-dealers—that is, of members of one of the most odious and disreputable of modern callings. We have tried, too, all sorts of remedies for the evils of our condition, all of which have failed in a greater or less degree. The great remedy tried after Fernando Wood's appearance—State interference—has failed utterly, and with unfortunate results for the State as well as the city. We have discovered, too, in the case of the Tilden amendments, that no remedy which seems in the smallest degree to attack the principle of universal suffrage stands much chance of being tried, however promising it may seem. Salvation must come apparently through the good tendencies of universal suffrage itself, and the best and most hopeful of these tendencies is the tendency to put men of mark in high places and trust them greatly.

We know how readily illustrations of the contrary can be furnished—Butler's success in Massachusetts is the most conspicuous; but they are exceptions and only feeble ones. In this city the tradition that the Mayor must be a man in good standing, has really, through all our troubles, never been broken. In municipal as well as State politics, too, it has been found that the abuses and corruption most complained of have nearly always resulted from the success of politicians in getting between the people and the candidates, and so dividing popular attention that nobody shall know anything as to what the effect of the election on the machinery of the government will be.

The present condition of New York exhibits the working of this system under peculiarly favorable conditions. The success of the Roosevelt bill would go far to overturn it. It would not bring in the Millennium, or drive liquor-dealers out of politics, but it would strip them of their power over municipal administration, and reduce them to insignificance. It would, moreover, at stated intervals array the intelligence, virtue, and order of the city against ignorance, vice, and corruption, for a fair trial of strength over an issue which everybody could understand, and which no dickering or dealing could obscure. We have ourselves no doubt as to what the result of such contests would be. The liquor-dealers would be worsted every time. We should every time put in the Mayoralty, not a saint or a sage, but a man identified with some one of the reputable interests of the municipality, and more or less eminent in talents and character; and once in he would have power to govern, and his failure to govern well would cover him with a disgrace which he would feel deeply, and which he could not escape by throwing the blame on some one else.

We were sorry that none of the speakers addressed himself to one objection, which weighs a good deal with many people, to the withdrawal of the power of confirmation from the Board of Aldermen. We mean the apparent analogy which exists, as regards its relations to the appointing power, between the Board and the Senates of the United States and of the various States. There are many very honest and intelligent men in this city, who have no liking whatever for the Aldermen, and who deplore as much as anybody the use they make of their power, who nevertheless are persuaded that the participation of some sort of legislative body in the work of selecting office-holders is an essential feature of the American system of government. They see it in operation in all the States, and they find some difficulty in understanding why the chief executive officer of a community containing over a million of population, and raising over $30,000,000 a year in taxation, can be safely released from restrictions which are held to be absolutely necessary in the case of Governors of States containing not half as many inhabitants and raising not over a third as much revenue. This point has been discussed to some extent, but not as much as is desirable.

Its apparent gravity illustrates one of the great difficulties of the situation. The municipality has never had the importance in America which it has had in Europe, simply because America has had no Middle Ages. The foundations of American freedom were not laid in walled towns held by armed artisans. Cities here have been of late growth, and have played but little part in our political development. It is only about fifty years since Boston received a charter or had a mayor, and since the Mayor of New York ceased to be appointed by the Governor, as a State officer. Down to this moment this city has never been recognized by the State as a separate or even partially independent political corporation, in any way resembling a State. In the Legislature, and by the very men who are so sensitive about the rights of the Board of Aldermen as a "legislative branch," the city is always treated as a mere creature of the State, and the charter as a temporary arrangement, which has no better motive than the convenience of each passing year. The Board of Aldermen has had its constitution altered half-a-dozen times within the last fifty years. Moreover, the Legislature might abolish it to-morrow, without question, just as it enlarges or restricts its powers, and raises, lowers, or abolishes its salary. In fact, it is impossible to find at Albany among the politicians of any party the slightest trace of the argument so freely used against the reformers down here, that the Aldermen are a legislative body, with functions and immunities like those of State Senates. The thought that New York city is an *imperium in imperio* apparently never enters into their heads. If it did they would undoubtedly concede to the people of this city some voice in framing their charter, but there is nothing for which they are less prepared.

The truth is, the theory that the municipality is a quasi-State, is a theory concocted, as far as politicians are concerned, for the simple purpose of defending and maintaining the Board of Aldermen as an instrument of corruption. No politician uses it seriously, or uses it against any other politician. It is reserved entirely for the confusion of good people down here, who show signs of reaching the conclusion that the Board is a public nuisance and disgrace, and ought to be abolished, or at all events be so shorn of power as to be rendered entirely harmless.

The American city is peculiar in its history as well as in its needs. In fact, it has no history, and there is but little analogy between its governmental needs and those of the State. But there is one great principle of American politics which is applicable to it, and which meets all its requirements, and that is that each city should be managed by its own inhabitants; that they should, with proper recognition of State supremacy, be the most potent influence in framing the municipal constitution; and that they should have full power to change it as their necessities may dictate. The object of city government is to give the inhabitants of a certain district clean streets, good wharves and drains, good light at night, a good police and good police magistrates, good jails, hospitals, and schools—or, in other words, to give them comfort and safety in their houses and streets. It is not its object to give them political rights, or gratify their political ideals, or in any manner provide for their welfare as members of a political community. All this is done by the State and the Union. The Mayor, the Aldermen, the Comptroller, the Register, the Sheriff, are all, just like the street cars and the ferry boats and the mud-scows, contrivances intended to increase the personal comfort of the men, women, and children living within the city limits. No part of the municipal machinery, whether person or office, exists as part of the eternal fitness of things, or in virtue of some municipal ideal entering into the foundations of society. There is nothing sacred in or about the City Hall, nothing which ought not to go as soon as it is found to interfere in any degree with giving the people of the city an economical and efficient administration of city affairs.

We need hardly say that the Board of Aldermen comes under this rule. There is hardly in African theology a more absurd superstition than the notion that if a body of men get themselves, either by accident or design, called a "legislative branch," the right to have a voice in the selection of the city officers be,

comes so firmly vested in them that, though they sell it in open market as they sell their whiskey, and use the proceeds in debauchery, it cannot be taken away from them. To acknowledge this would be really to introduce a totally new and most destructive principle into American politics, namely, the old mediæval doctrine that there are arrangements in government so sacred that they can under no circumstances be changed, no matter how badly they work, or how much human suffering they cause. The American doctrine is that whatever in politics does not work well, must "go," and that no institution must be allowed to work human misery. This of course covers ignorant, corrupt, and liquor-dealing Aldermen.

STEALING NEWS.

Mr. Henry Watterson is about to introduce into Congress, in the interest of the press, a measure which he very incorrectly calls a newspaper "copyright" law. His language, as given in the *Tribune*, is as follows:

"It simply operates to protect property in news from piratical concurrent publication. This can be done by a clause in the copyright laws making collected news, the product of skilled labor and outlay, exclusive to those who pay for it, for twenty-four hours. I mean all news and news of every description and every association. As matters are, news is not recognized as property at all. Everything about a newspaper office, from the perfecting press to the newsman's pot of paste, is property, and he who steals it falls within the reach and compass of the law. But that which constitutes the real value of a newspaper property—its news franchises—costing vast sums of money and years of special enterprise, training, and labor—has no legal status whatever. It is practically outlawed; anybody can steal it with impunity. The proposed measure protects it from pirated use and concurrent publication for twenty-four hours. It creates, indeed, a new property; that is, property in news. No one can oppose it except those who want to rob others of their labor and money."

In "news," he continues, he would include "all original, special, and general matter exceeding one hundred words, sent by post or wire, and embracing the original communication of information of any and every description."

The copyright laws of the United States all rest upon a provision in the Constitution giving Congress the right to secure to "authors" the "exclusive right" to their "writings" (Const. U. S. Art. I., sec. 8). Mr. Watterson's measure may perhaps, in a certain sense, be said to secure rights to the "authors" of despatches, through the newspapers which buy of them; that is to say, any one who collects and sells news to the press might be able to get a slightly better price for it, if the newspaper purchasing it could prevent its being stolen by other newspapers. But this does not meet the great difficulty in the case, which lies in the fact that it is absurd to talk of a man who picks up a piece of news or an "item" as an "author" at all. The reason why copyright laws are passed is to secure the fruits of original, intellectual labor. But the proposed copyright in "news" does not do this. Any one may collect news without any original intellectual effort, and with very little effort of any kind. Some people do it by listening at keyholes, most people in the ordinary course of conversation with the persons whom they meet in the way of business or pleasure. If a collector of news in London telegraphs to New York that Sir Stafford Northcote has just delivered a lecture on "Nothing," or that Lord Cairns has offered Miss Fortescue £10,000 to release his son from his marriage engagement, who is the person whose "property" in the news ought to be protected, or who is the "author" of it? Is it the collector of the "item"? If so, any one who has ears and eyes is an "author." On the other hand, if any one can be said to have property in such news, it would seem to be those whose pecuniary interests or reputations are affected—Sir Stafford Northcote, Lord Cairns, his son, and Miss Fortescue. The fact is, that protection against the theft of news has nothing more to do with copyright than it has with patents. Indeed, the persons who could most fairly claim protection from Congress as authors of news are the fabricators of fictitious despatches, the producers of the extraordinary bear stories, or dog stories, or "romances of real life," or anecdotes of remarkable longevity, extraordinary instances of long periods of sleep, or silence, or abstinence from food, which do so much to render lively the columns of country newspapers. These are really the result of literary labor of a certain kind. But this is not the sort of "news" that Mr. Watterson wants to protect.

What his bill is really intended to prevent is the theft of news from one newspaper by another, and chiefly of special despatches, domestic or foreign. If this can be done by giving despatches the protection afforded other kinds of property, every respectable newspaper in the United States will no doubt be glad to support the bill; but there are enormous difficulties in the way which will make themselves felt the moment the scheme is put into the form of a law. The most serious of these is the fact that the property cannot by any human ingenuity be kept in the original form in which it is first published, and consequently cannot be traced. The art of "expanding" despatches supplies a ready means to the newspaper thief of stealing, and at the same time of covering his track completely, or so completely as to make all hope of a successful criminal prosecution very dim. Were the practice made illegal, by putting in a few adjectives and verbs of one's own, and a little information out of some encyclopædia or hand-book, the matter could be so disguised that we should have greater difficulty than we now have in tracing our property. But this is not all: there is a legitimate as well as an illegitimate way of using "news" found in other columns. The same "news," for instance, which appears in one newspaper as a "special cable" reappears immediately in another newspaper as a topic for a paragraph, editorial, or an "item." If this were made a criminal offence, most editors would be in jail all the time; in other words, the newspaper business could not be carried on.

The most aggravated and clearly provable form of the offence which Mr. Watterson wishes to reach is the habitual fraudulent reproduction of despatches as "special" which are really stolen. A law making any such reproduction a criminal offence would render it dangerous to transfer despatches openly from one newspaper to another, and thus might do some good. But there is no way to reach "expanders," and by means of expansions, or other similar devices, the theft of despatches will always go on. It is a very low and demoralizing sort of crime; but it probably does not do the newspaper which is robbed much substantial injury, because in the long run the readers of newspapers do not attempt to get the news of the day from papers which steal it over night and publish it twenty-four hours late.

THE CAPE COD LIBEL SUIT.

Mr. Nightingale's verdict of $1,095 recovered from the Boston publishers of the story called 'Cape Cod Folks' is practically exactly what it is not legally—a species of punishment inflicted by the jury, much as if the case had been of a criminal nature. What the defendants had done was first to publish in the ordinary course of business a book which turned out to contain the names of a number of people living on Cape Cod—not illustrious, or eminent, or public characters, but plain New England village people, who, had it not been for the author, would have lived and died unknown to fame. Speaking under the full sense of responsibility which such a verdict must produce, we may venture to suggest that it was a bright and happy day for Mr. Nightingale and his friends when they found that they had got into print in this singular way. They immediately made a combined attack upon the publishers and demanded redress, and they have now for a year or two been obtaining redress and notoriety in equal parts. The publishers first brought out a new edition of the book with fictitious names substituted for the real ones, but this did not take away or wipe out the libel, as Mr. Nightingale has now thoroughly proved.

The plaintiff's evidence was very amusing, because it consisted chiefly of denials by him of statements made in the book, as if these had been made as matters of fact. The following is a fair specimen of the evidence. The plaintiff's lawyers read from the book: "'Teacher, this is our champion fiddler, inventor, whale-fisher, cranberry-picker, and potato bugger.' . . . The youth of the tuneful and birdlike name dealt his tormentor a hearty, though affectionate, cuff on the ears, and, being thus suddenly thrust forward, he doffed his broad sou'wester, took the hand I held out to him, and, stooping down, kissed me, quite in a simple and audible manner, on the cheek." The plaintiff denied that he had kissed the author of the book then or at any other time. Again, the plaintiff denied many statements regarding his family. His mother, for instance, did not wear "over her cotton gown, on occasions when she went out, a very fine, very thin, old-fashioned mantilla, bordered with a deep black fringe," and consequently it was not true, as the author alleged, that "this pathetic remnant of gentility, borne rudely about by the Cedarville winds, with Lydia's refined face and melancholy dark eyes, gave

her a very interesting and picturesque appearance." But no evidence was brought forward on the trial to show that Mr. Nightingale was really injured in pocket, person, or reputation by the book. He was, we believe, subjected to the process known to photographers and novelists as "idealization," so that it is at least open to doubt whether his position in the world was not improved by the publication in some respects. What he really complained of, and what the jury decided was a just complaint, was that his name had been "made free with" in print, or, in other words, that his right to privacy and obscurity had been invaded. He summed up his injuries very concisely by saying that he had been "pointed at" at the railroad station.

The author of 'Cape Cod Folks' has, therefore, done the public a good turn in showing that there is a point beyond which a novelist may not go in bringing private persons into his books. He may not do it by name. That she and the publishers should have supposed that this might be done with impunity is, perhaps, not a matter of surprise, when we remember that the press is doing something very similar, and indeed much worse, all the time. Not a week passes that purely domestic and family affairs are not published in the newspapers with the names of the persons affected in full, and generally in connection with matters which are sacred from public intrusion not only in morals but in law. No one, however, can read the evidence in such a case as that of the 'Cape Cod Folks' without seeing that a suit for damages must in the long run be a poor sort of redress. Any firm of publishers, though entirely innocent, might be put in the awkward predicament in which this Boston firm now finds itself. They might, perhaps, relieve themselves by suppressing the book altogether, but in that case the persons injured are left without redress. Moreover, for an injury of this sort, where it is real, a long civil suit with all the expense incident to it, and the worry and harass of cross-examination to which the plaintiff is always subjected, is a bad remedy. It is a case, not for damages, but for punishment of the guilty person; and whatever the guilt of the publishers, the author must always be guilty in such a case. Probably criminal proceedings were out of the question in this case because the author was a woman, and a jury would not be likely to send a woman to prison for such an offence. We believe, however, that it is women far more than men who need a lesson in this respect. We doubt if any man living would have dared to write 'Cape Cod Folks'; and certainly, in the press, it is the anonymous female contributor who always makes the most irresponsible use of her "chance" to say whatever comes into her head about her friends and acquaintances.

THE OYSTER IN SCIENCE AND POLITICS.

Not long ago the writer saw a distinguished European diplomatist standing before a bulletin in a college class-room, where, under the words "The Hog in Politics," there were numerous extracts from the newspapers of the day on the diplomatic discussion of American pork. The part which pork has taken in international affairs is now assumed by the oyster in domestic politics. It reminded us of the civil war when we read in the news from Baltimore, a few days ago, after a startling head-line, "Ye dredgers, beware; the police boats are after you," these belligerent items:

"The oyster police steamer *William T. Hamilton*, Captain Gordy in command, arrived in the harbor shortly after dark last night. She came to the city by order of the Governor to get the arms necessary for the war to be waged against the illegal dredgers in Fishing Bay and Honga River. The day was too far advanced for the fitting out, and the preparations were postponed until this morning. The steamers *William T. Hamilton* and the *Leila*, and the sloop *Julia Hamilton*, will be thoroughly stocked with ammunition. . . . A special despatch to the *American* from Annapolis last night said: 'The Board of Public Works had a meeting to-day to take action regarding the Dorchester oyster war.'"

"In accordance with the action of the Board of Public Works, Governor McLane issued a requisition yesterday to Adjutant-General Watkins for a supply of arms for the oyster boat. The order of the Adjutant-General was presented to Mr. D. H. Leaming at the Fifth Regiment Armory yesterday afternoon about half-past four o'clock, and he delivered twelve 45-calibre rifles and 1,000 rounds of cartridges, which will be loaded on the steamers this morning."

Another item of about the same date informs us that the envoys sent from the Government at Annapolis to the Government at Richmond have returned without making an adjustment of the difficulties between Maryland and Virginia. A day or two later came further intelligence, from the seat of war, under these headlines: "Dredgers Taken In.—Captain Gordy on the war path—Capturing the violators of the law in Honga River—Their vessels in tow—Work of the police—Cause of the trouble—The lack of Arms":

"Crisfield, February 10.—When the oyster police boat *Wm. T. Hamilton* steamed into Hooper's Straits this morning at half-past eleven o'clock Captain Gordy gazed intently through a telescope toward a fleet of vessels sailing in the mouth of Honga River, where dredging for oysters is not permitted."

On Sunday morning, just as "in the old war times," a special notice was issued for a mass meeting to be held on Thursday for the discussion of "the oyster question." "Live and eloquent speakers," says the call, "will address the meeting." Similar despatches have come from the seat of war since we made the foregoing extracts.

The key to this bellicose excitement is to be found in the fact that the oysters of the Chesapeake are rapidly diminishing in numbers, and foresighted canners, dealers, merchants, and statesmen see that a very important branch of traffic is in danger. An oyster fleet is requisite to keep off intruders from a distance. Diplomacy is called in to negotiate between the claims of different States. More noteworthy still, science is invoked, and an expert morphologist and embryologist has devoted many months to studying the life of the young oyster and the natural conditions of its infantile growth. We would here call attention to a remarkable book which has just been printed in Baltimore, the 'Report of the Oyster Commission of the State of Maryland,' a quarto volume of nearly two hundred pages, illustrated with numerous engravings, and with several maps of the oyster beds of the Chesapeake. In this blue-book the Chesapeake oyster is discussed from every point of view except the ordinary one, the gastronomic. It is treated statistically, economically, legally, historically, geographically, microscopically, embryologically. All that is known of the origin, development, multiplication, diminution of the bivalve is brought together, with the suggestions of a scientific zoölogist and of a practical oysterman, in order that the people of Maryland, and especially the Legislature of the State, may be informed upon the dangers which now threaten an essential traffic, and of the remedies which are within reach, if suitable legislation can be secured.

With the coöperation of two associate Commissioners, Messrs. Waddell and Legg, this report has been prepared by Dr. W. K. Brooks, the Chairman of the Commission, who has been for several years past the Director of the Chesapeake Zoölogical Laboratory, a department of the Johns Hopkins University devoted to the seaside study of marine life. His scientific memoirs are well known to zoölogists, one of them having been published by the Royal Society of London, others by the Boston Society of Natural History, and others elsewhere. His recent volume on 'Heredity' is pronounced by a competent critic the most considerable contribution which has been made in this country to the Darwinian theory of the origin of species. We mention these facts that those who are unfamiliar with his work may perceive that he has a right to speak with authority.

The most important part of the investigation was made prior to the appointment of an oyster commission. When Dr. Brooks organized the Chesapeake Zoölogical Laboratory, it was with the hope and belief not only that he could advance the science of zoölogy, but that he could throw some light upon what was then a very obscure matter, the reproduction of the American oyster. His success was even greater than any of his friends anticipated. By prolonged and accurate observations, repeated in successive breeding seasons, he discovered the fact that the American oyster (*Ostrea virginiana*), is not hermaphrodite, like the European oyster (*Ostrea edulis*); on the contrary, the sexes are separate, the eggs are fertilized outside the body, and the young can be reared artificially in enormous numbers. These interesting statements were published in 1879, in an elaborate paper, illustrated by numerous drawings which show the development of the oyster germ, as seen under the microscope at very brief intervals from its impregnation on through two or three days—showing also that independence of parental care which is sometimes thought to be characteristic of young America. These discoveries (to which, by the way, Mr. Lowell, the American Minister, made a humorous allusion when he spoke, on the American day, in the International Fish Exhibition, at London, last summer) attracted attention far and wide, and led to various attempts to fertilize artificially the oyster eggs, and to bring the young to maturity. The practical difficulties are now almost

and perhaps completely overcome, and there is every reason to believe that before long oysters may be bred artificially with greater certainty than trout and shad and others of the finny tribe. No better illustration can be found in the annals of natural history of the general good to the public which may follow the prosecution of a delicate and difficult microscopical research on an obscure question in embryology.

The exact share of credit to which the various students of this problem are entitled, we need not attempt to determine, but among those whose development of Dr. Brooks's discovery has been most efficient, a few names should be mentioned. Lieutenant Winslow, U. S. N., who had seen Dr. Brooks's experiments at Crisfield in 1879, was stationed the next year at Cadiz, and there experimented with the Portuguese oyster (*Ostrea angulata*), finding it to be like the American, and capable of artificial propagation. A French naturalist, M. Bouchon Brandeley, referring to the encouragement he had received from Brooks's experiments, took the next step forward with further attempts to produce the Portuguese oyster, and he succeeded in raising a very great number of seed oysters fit for planting. The paper on this subject was translated by Mr. J. A. Ryder, and printed under the direction of Professor Baird in the *Bulletin* of the United States Fish Commission. Mr. Ryder then constructed at Stockton, on the coast of Maryland, a pond similar to those of Bouchon Brandeley, and in September last made public the welcome announcement that the young from eggs artificially impregnated had been kept alive forty-six days, until they had become from one-fourth to three-fourths of an inch in diameter, "demonstrating that the young would grow just as rapidly in a pond as in the waters of the open bay," and that "it is perfectly feasible to rear oysters from artificially fertilized eggs." The further development of this possibility now goes into the hands of practical men. If they do their part with as much skill as the scientific investigators have done theirs, the oyster will not perish.

The Oyster Commissioners of Maryland, after giving the facts which we have quoted, and many more, pertaining to the decline of the oyster productivity and the need of legislation to prevent further interference with the oyster industry, declare it to be their opinion that the natural fertility of the oyster beds must be increased by some method of artificial oyster culture, and that gradually the oyster property of the State should be put into the hands of private farmers, in order that private enterprise may secure the best returns.

THE FATE OF LOUIS XVII.

Our Paris correspondent, when writing of the last days of Louis XVII. (*Nation*, No. 969), stated that there are many people in Europe "who still believe that the unfortunate son of Louis XVI. and of Marie Antoinette did not die in the Temple," and that "there have been several false Louis Seventeenths." He may or may not have been aware that America once had her Louis XVII. in the person of the Rev. Eleazar Williams, a missionary among the Indians, and a clergyman in good standing of the Episcopal church. Thirty years ago a fair-sized controversy raged in our newspapers and periodicals concerning his rights, and the Rev. John H. Hanson published a vigorous work of 500 pages or thereabout, while a translation of the work of Beauchesne was brought out by the Harpers and became the adverse authority.

Whatever the Rev. Mr. Williams's origin, there certainly had been some strange phases in his life. The first thing known of him was that he was an idiotic boy about the age of the Dauphin, the reputed half-breed son of an Oneida woman in the State of New York. The shock of a fall in Lake Champlain restored his faculties, and soon after this he was taken from his supposed Indian mother and placed under the charge of an intelligent New England farmer. Money for his education was regularly supplied, but from what mysterious source it came no one knew. Thus the Indian boy year after year was supported for some unknown reason and by some unknown person, until, at length, he became a clergyman and a missionary among his own people. But he possessed the manners and apparently the tastes of a gentleman, and some of our readers may remember hearing him preach from the pulpit of the late Rev. Dr. Washburn.

In the *Knickerbocker Magazine* of 1854 there appeared a somewhat judicial review of the controversy, entitled "A Charge to the Jury of the Public in the Dauphin Case." The claims of the Rev. Mr. Williams were regarded as the weakest part of the case; but the escape of the Prince was deemed possible, and circumstances were adduced which at that day could hardly be reconciled with his death in the Temple. Whether the recent historical discoveries in Paris throw light on these discordant circumstances may be worthy of our correspondent's further consideration. In the meanwhile we extract and transcribe the more important of them from the old review in the *Knickerbocker*. They are substantially as follows:

Two witnesses, according to M. Beauchesne, testify positively as to the death of the Prince, viz.: Lasne and Gomin. They tell us that they were his attendants, the one from the 31st of March, 1793, the other from the 8th of November, 1794, to the day of his death. They further minutely describe the condition of the Prince from the 5th to the 8th of June (there is a blank in Beauchesne's account from the 1st to the 5th), and then his last moments, and the hour and the minute when he died. In the eloquent language of his biographer, "Lasne put his hand upon the heart of the child. The heart of Louis Seventeenth had ceased to beat! It was two hours and a quarter after midday." As these persons were both in the Temple before the 29th of May, 1775, it is evident that they both knew the real Prince. As they were constantly and solely in attendance, it is evident that no exchange could have been brought about without their knowledge. As they testify explicitly and positively that no exchange did take place, and that Louis XVII. died on the 8th of June, in the Temple, there is no ground for mistake. We must therefore conclude, either that Louis XVII. died as they describe, or that their statements are wilfully false. What, then, are the facts, in the nature of circumstantial evidence, which tend to discredit this positive testimony and throw a doubt upon the alleged death of Louis XVII.?

The eminent physician Desault attended the Prince up to the 29th of May, 1775. He had known him and been his medical attendant before his imprisonment. His character is beyond suspicion, and his evidence beyond doubt. Both parties agree that his testimony is to be taken as absolute truth. Desault found the Prince worn and emaciated, showing little intelligence, and preserving a continued silence. Although he made every effort to arouse his faculties and win his affection, the child gave no stronger sign of mental power than feebly taking hold of his coat as he was about to leave the room. On the night of the 29th of May, Desault died. *Subsequently to this, the child in the Temple seems to have talked frequently*, as is shown by at least Lasne, Gomin, Bellanger, and the physicians Pelletan and Dumagin. Nor had his disease been subject to sudden changes, as the account of the first visit of Laurent, nearly a year before his death, sufficiently shows. "The noise around him," says Laurent, "made him tremble, but he did not stir. He answered no question. He was conscious of nothing. He breathed. His open eyes had no expression. Their color had changed. He had the look not of a fool, but of an idiot." In addition to this, the evidence of the physicians shows *that the child dissected by them had died with unimpaired intellect.* "The brain and its dependencies," says the *procès-verbal*, "were in their most perfect integrity." The evidence incontrovertibly shows that on or about the first of June a sudden change took place, and continued till his death.

Next in the chain of circumstantial evidence is the alleged change in the physical condition of the Prince. It may be summed up in two sentences: First, Desault testifies that the Prince had "the germ of scrofulous affection," and that the malady had "scarcely imprinted its seal on his constitution, nor manifested itself with any violent symptoms—neither vast ulcers, nor rebellious ophthalmias, nor chronic swellings of the joints." Secondly, the surgeons who, ten days after the last visit of Desault, made the post-mortem examination, testify that all the appearances were "evidently the effects of a scrofulous disease of long standing, and to which the death of the child should be attributed." In support of these opinions respectively, we find, first, that Desault applied gentle remedies up to the 29th of May, recommended air and exercise, and, according to the Duchesse d'Angoulême, "undertook to cure" the Prince. Secondly, that Pelletan, on the 5th of June, found the child so low that he instantly called in a consulting physician—M. Dumagin, chief physician of the Hospital of the Unity. The eminence of all these physicians precludes a doubt as to professional errors or intentional misrepresentations. We have the undoubted proof *that a very great change had taken place in a period of seven days, which is not noticed, explained, or mentioned by the attendants, Lasne and Gomin.*

Next as to the circumstances attendant on the death or disappearance of the Dauphin. First—The Government separated the Prince from the rest of his family. Secondly—They appointed a keeper, a friend of Marat, known from his hatred of the royal race. Thirdly—This man was obliged to become a prisoner in the Temple; he was not even allowed to go to his own home except when guarded by a file of soldiers. Fourthly—The Government set apart as large a sum for the expenses of keeping and guarding the child as for all the other members of the family. Fifthly—A system of espionage was established, intricate, troublesome, and expensive. Paris was divided into forty districts; from each district one Commissioner was elected. A Commissioner visited the Temple each day, and each Commissioner visited it but once. With his single visit his term of office ended. Sixthly—Toward the end of the supposed existence of the Prince, the three most eminent physicians in France were appointed his attendants. Whatever was the motive, an intent of preservation is apparent.

It is next to be noted that the Comte de Provence, the uncle of the Prince and his heir, en

deavored (whatever his motive may have been) to obtain possession of his nephew. It is an undoubted fact that he at that time had emissaries in Paris, foremost among whom was the Comte de Fenouil. Now, of the three persons who were in attendance on the Prince, Gomin was a royalist, Lasne a moderate republican, afterward employed by the Comte de Provence, while Bellanger had been his ornamental painter. It has been alleged that these persons obtained an entrance to the prison of the Dauphin through the intrigues of the Comte de Fenouil; and all this raises a presumption of the intent on the part of the Comte de Provence to procure the escape of the Dauphin, and on the part of the Government to connive at it.

But at this time a very startling event occurred in this drama. Desault, within a few hours of his last visit to the Prince, died. It is again to be remarked that he was personally acquainted with the Prince; was a physician of eminent reputation and a man of stainless integrity. M. Beauchesne asserts that he died of ataxic fever; Mr. Hanson, that he was poisoned by the Government. Aside from the suddenness and the singularity of his death at this particular time, there is no evidence indicating that it was unnatural, unless we except statements said to have been made in this country several years ago, by M. Abeille, the pupil of Desault. But there is one circumstance to be noted, which is, that the death of Desault was falsified in the records of the Government. Whatever may have been the motive, it was registered (as is shown by Beauchesne) four days later than it actually occurred. During these four days no physician attended the Prince, and of them the account of Beauchesne is silent.

The conduct of the royal family, it is alleged, was equivocal, suspicious, and irreconcilable with a belief in the death of the Dauphin. Although the highest marks of respect were paid to the memory of Louis XVI., Marie Antoinette, and the Duc d'Enghien, none were given to the last, though youthful, King. In the graves of the two former quick-lime had been emptied, and hundreds of victims buried over them and around them to obliterate the spot. The grave of the Dauphin could have been easily discovered, and the surgeons' examination of the skull afforded certain proof to identify the remains: yet while the supposed dust of Louis XVI. and Marie Antoinette was exhumed, to be reburied with stately pomp and studied mourning, the bones of Louis XVII., in an obscure cemetery, unmarked by a single memorial, still rest like those of a common pauper.

Again, Pelletan, the physician, carried from the post-mortem examination the heart of the child who died in the Temple, and he offered it to the King as the heart of the Dauphin. An inquiry was instituted, in which Lasne testified that he was present at the examination, and nothing was carried away. The evidence, although contradictory, can be reconciled; for the statement of Lasne amounts to nothing more than that he observed closely, and did not see anything taken. Pelletan was a physician of the highest standing, and entitled to belief, yet Louis XVIII. adopted the statement of Lasne, and rejected the relic.

More interesting, if not more clear, are the admissions to be derived from the conduct of the Duchesse d'Angoulême. She was a woman of dauntless energy, unwavering resolution, and possessed of self-command beyond the ordinary measure of her sex or race. She was dignified, stern, conscientious, believing fully in the religion which she professed, and devoted to the system of which her family was the exponent. So greatly, indeed, did she possess these qualities, that Bonaparte is reported to have said of her that she was the only man in her family. Her position was as peculiar as her character. She was the daughter of the murdered King, the niece of the reigning one, the sister of the rightful Prince, and the wife of the heir-apparent. Like Louis XVIII., she erected no monument and allowed the heart produced by Pelletan to be retained by his family. We cannot discover a single act indicating the sisterly regard which would naturally be shown toward the remains of a brother. Yet to the other members of her family who had been the victims of the Revolution, no testimonials that an affection almost fanatical could prompt were unpaid. For her cousin, the Duc d'Enghien, once a week for months she had masses performed, and repaired to her chapel to pray for his soul. It is truly said, in reply to this, that the like offices were unnecessary, according to the tenets of the Catholic faith, for the soul of a child. But, while this is true, it nevertheless shows a carelessness in regard to her brother strangely at variance with the fervor of the devotion which she rendered to what she deemed the sacred victims of an unholy rebellion.

To the Duchesse, Naundorff preferred his claim. Repeated were his applications for a personal interview, and repeated her refusals. To every request she returned not a decided negative, but a condition that he should send her the documentary evidence he pretended to possess. At one time she appears to have deemed a personal interview with the King of Prussia necessary to resolve her doubts. Whenever this subject was brought to her notice, strong agitation is said to have shaken her enduring frame. From her character and conduct, two inferences may be drawn—firstly, that she would never have consented to deprive her brother of his rights, and that her agitation was due to the love she bore him and the horrors he had endured; secondly, that she did assent to the surrender of his rights from motives of state policy, but, in the unbending pride of her nature, scorned to render those testimonials of respect and love to the unknown dust of the supposititious Prince which she would eagerly have given to a murdered brother and the heir of her kingly race.

IRISH TROUBLES AND ENGLISH OPINION ABOUT THEM.

LONDON, January 23.

DURING the last six or eight months Ireland has been more free from agrarian and political crime than for a long time before. Whether owing to the benefits extended to the tenants by the Land Act of 1881, or to the terror inspired by the Prevention of Crimes Act of 1882, or to the reaction that naturally followed upon the violent agitation which prevailed from the establishment of the Land League until the passing of the latter measure, or to all these causes taken together, there have been singularly few murders or other outrages, and also, through the three most frequently disturbed provinces, singularly few conflicts between the police and any section of the people, or between different factions. Nevertheless the Irish problem has not become less menacing. It still overshadows the other troubles which our statesmen have to confront, and is mixing itself up in a bothersome way with political questions which formerly affected England and Scotland only.

In the Parliamentary session on whose brink we now stand, Irish affairs are likely to become prominent in three forms. The first of these relates to the administration of Lord Spencer, and particularly to the prohibition of political meetings in the northern counties. Ever since Mr. Healy, one of the ablest and most bitter members of the Parnellite party, was elected to the House of Commons last spring for the County of Monaghan in Ulster, it has been the prime object of that party to win Ulster, and to eject from Ulster constituencies the Liberals and Tories who divide its representation between them. Although the upper classes in that province are nearly all Tories, and the middle classes, especially the tenant farmers, mostly Presbyterians, Scotch by descent and Liberals in politics, there is a large substratum of Roman Catholics who would support an extreme Home-Rule candidate, and the enterprise of gaining over to the same side a part of the Protestant tenantry does not seem hopeless. Accordingly the Parnellite party has begun to hold meetings and preach Home-Rule doctrines in the Ulster counties. This incensed the Tory party in the North, a party whose composition deserves to be explained. It is led by the nobility and squirearchy, who are nearly all Episcopalians and fierce Conservatives, while the rank and file are supplied by the artisans and small shopkeepers in the towns, with some tenant farmers in the country districts—persons who are either Episcopalians or Presbyterians, and largely belong to the Orange organization. The Orangemen have thus the force which belongs both to an aristocratic and a democratic body. Their chiefs are men of rank, wealth, and influence, who have, unfortunately for the peace of the country, been permitted to keep in their hands the local government and the best places. The rest, the humbler followers, have the strength which comes of obedience to leaders, good organization, ignorant fanaticism, and the fierce courage which fanaticism produces in men of a hardy race. They are fond of a fight, and formidable in a fight, having on their side the recollection of two centuries of domination over the Roman Catholic aborigines. The smouldering rage of the Ulster Orangemen at the progress of the Home-Rule agitation was kindled into a flame by the visit of Sir Stafford Northcote, who had been taken into Ireland on one of those talking tours which have grown so common lately among us. Though he, being a man of peace and gentleness, and knowing the dangerous nature of the soil he was treading on, carefully abstained from irritating or inflammatory language, the mere fact of his presence as the leader of the Tory party, and of their assembling in large meetings to welcome him, stirred the susceptible hearts of the Orangemen, whose landlord chiefs took every opportunity of appealing to them to show their hatred to Mr. Parnell and their loyalty to the British Crown.

The opportunity was given when the Parnellite meetings began. A certain Rossmore, a zealous Orange squire, called on his brethren not to permit disloyal meetings to be held, and ever since then every political gathering held by the Home Rulers in Ulster or on its borders has been threatened with attack. In some instances the Government have forbidden the meetings, not necessarily as disapproving of them, but conceiving that they are likely to lead to breaches of the peace. In others they have allowed them to go on, and sought to protect them by putting large bodies of troops on the ground, charged to repel any onslaught of the so-called Loyalists. Such conduct seems tolerably good evidence of impartiality. No one but an Orangeman can suppose that Lord Spencer desires to favor and assist that Nationalist party which has continued to inveigh against his administration for the last eighteen months, and which accuses him of causing the death of many innocent victims, viz., the persons executed for agrarian and political assassinations. No one but a heated Nationalist can fail to recognize the wish to see fair play which has

led him to protect Home-Rule meetings, even at the risk of incensing that part of the population which is most attached to the British connection. However, Lord Spencer and the Government are attacked from both sides with equal vehemence. The Orangemen say that he is playing into the hands of Mr. Parnell. The Parnellites complain that their meetings have occasionally been prohibited, and declare that no justice can be had from him or his chief secretary. In any country but Ireland it would be felt that these opposite accusations, the one set as sincere as the other, answered each other, and proved that the aim of the Viceroy had been to treat both parties alike and seek only the preservation of order. But in Ireland this is not felt. The middle party is small there. People have mostly ranged themselves in one or other of the two hostile camps: that moderating influence of an uncommitted public opinion, which judges public men according to their behavior from day to day, is all but extinct. We hear, therefore, that in the first nights of the session two attacks are to be made by Irish members on the Government. The Nationalists will condemn its whole policy since the passing of the Crimes Act. The Orange members, seconded by the weight of the whole Tory party, will complain of its leniency to the Nationalists, and the discouragement it has inflicted on the "loyal Protestants" of the North. At this moment numerous addresses are being presented by the Orangemen to Lord Rossmore, commending his action in calling on the Protestants to rise and prevent the holding of Home-Rule meetings, and sympathizing with him under the punishment which the Government inflicted on him by striking his name out of the list of magistrates. He is a young man of no personal or political note, but for the moment he is the representative of the principles which triumphed at Londonderry and on the banks of Boyne Water, and is cheered at the stations through which he travels to Belfast to receive the homage of his fellow-Episcopalians.

What do England and Scotland think of all this? In them there fortunately exists that sober class of minds which Ireland wants. Well, in England the mass of the Conservative party, sympathizing with the Irish landlords and the disestablished Episcopal Church, and hating the Parnellites and their works, applauded the Orangemen, yet without strongly censuring Lord Spencer, who is personally esteemed for the cool courage and firmness shown in his whole attitude. The Liberal party is more divided in opinion. The majority approve the policy of the Government, holding that order must be maintained at all hazards, that the Nationalists are entitled to summon their meetings so long as they do not preach outrage or sedition, and that the Orangemen are inflicting the heaviest blow on the future of Ireland when they stir up the embers of religious strife. But there are also many among the Liberals, and among those moderate men who can hardly be reckoned to either party, who own to a sneaking sympathy with the Orangemen. They are much incensed at the attitude of the Parnellites, who have not (as they think) shown any friendliness to Mr. Gladstone's Government after all it has done for the Irish peasantry, and the odium it has encountered on their behalf; who have never admitted the justice of the sentences passed on assassins, and whose sole object is to embarrass the Cabinet and Parliament by every possible means. "These inciters of outrage," they say, "and apostles of sedition, having succeeded in demoralizing the peasantry of Leinster, Munster, Connaught, have come into Ulster to stir up strife and disaffection among a hitherto quiet population. It is only natural that the loyal subjects in that province, anxious to maintain law, order, and the present connection of the three kingdoms, should rise up to oppose these revolutionaries, keep them out of the north, prevent England from supposing that the sentiments of the Roman Catholics of the north are shared by the people of Ulster. Their zeal may have outrun their discretion, but after all it is zeal in a good cause, and, though the Government must discountenance violence, it need not be sorry to see these demonstrations, which prove how far the Parnellite party are from being a truly national party." This vein of feeling among the English has always to be reckoned with, and any recrudescence of crime in Ireland would make it far stronger.

Meantime the Orangemen are making hay while the sun shines. They are holding meetings nominally to protest their loyalty to the Crown, but really to denounce Mr. Gladstone's Government. They have not suggested any counter policy, and, indeed, admit that under Lord Spencer's rule the country is unusually quiet. But they apprehend serious mischief when the question of Irish local government comes up for settlement, and declare that the Ministry is secretly in league with Mr. Parnell, and has by no means exhausted its budget of concessions to agitation. In the midst of these contending cries of Nationalist and Tory, the Irish Liberals are silent.

It looks, indeed, as if Irish Liberalism would soon come to a perpetual end, ground to powder between the upper and nether mill-stones of the two extreme parties. The seats which the Ministerialists hold, already few in number, will be contested at the next election, so say the Nationalist papers, by followers of Mr. Parnell. In the three Roman Catholic provinces these candidates will probably succeed. In Ulster the Protestant Liberals who represent the counties of Armagh, Tyrone, and Donegal may hold their ground. When a few weeks ago the Irish Solicitor-General offered himself for the county of Londonderry, the Parnellites did not oppose him, because they were incensed at the outbreak of Orangeism, and feared, by running a candidate of their own, to let an Orangeman in. But they may decide upon different tactics when the general election arrives, and conclude that their best plan is at all hazards to weaken the present Government, so that between two nearly equally balanced English parties they may the more easily secure their own objects. The result of their deciding to contest the Ulster Liberal seats, as well as those in the rest of Ireland, would probably be to annihilate the Irish Liberal party in the House of Commons, and leave some seventy or eighty Parnellites confronting some thirty Orangemen. Two or three individual Liberals would survive in respect of their personal popularity, but the party would have vanished, and with it one considerable element of moral as well as voting strength, which Mr. Gladstone has hitherto been able to count upon. There would then be practically no Irish representatives who approved his policy, but only two sets of enemies attacking it from opposite points of view—not a pleasant state of facts for a Cabinet bringing forward further Irish reforms.

The second and third topics for debate which Ireland is likely to furnish to Parliament, relate to the enlargement of the electoral franchise in her boroughs and counties, and the popularization and reform of her local self-governing institutions. These are, however, too important to be dealt with at the end of a letter. Y.

VITROLLES AND THE BOURBON RESTORATION.

PARIS, January 31, 1884.

M. EUGÈNE FORGUES, who has already published the correspondence of Lamennais, is now publishing the 'Memoirs and Political Relations of the Baron de Vitrolles.' Vitrolles was one of the most important factors of our history, in a terrible crisis; he was one of those men who appear suddenly, who disappear almost as rapidly, and who leave hardly any trace, though their action has been almost decisive. They may be compared to the machinists in a theatre; the actors are on the scene and before the public; *they* are unseen, unknown. Vitrolles threw himself in the midst of the allied sovereigns and of their ministers, in their last struggle against Napoleon, and he worked with all his heart and soul for the restoration of the ancient dynasty of the Bourbons, at a moment when the fate of France was still uncertain.

He was born in 1774 at Vitrolles. His father belonged to the *noblesse de robe*, and was Councillor in the Parlement of Provence. In 1791, when only seventeen, he enlisted in the army of Condé. He spent three years in Germany, on the shores of the Rhine, and in the Black Forest, in great misery, having no money but his pay of three sous a day. He married, nevertheless, in 1795, Mlle. de Folleville, who was the adopted daughter of the Duchess of Bouillon, and travelled with her in Germany and in England. During the period of the Empire, he returned to France, but lived in absolute retirement.

The Memoirs of Vitrolles begin with an eloquent picture of the last years of the Empire. This chapter is written in the severe style of our old historians, and, though it is at times a little pompous, it is really impressive. He succeeds well in showing how a succession of tragical events, of battles, of victories, had finally thrown France into a state of stupor: "The people learned of the victories, as of the conscriptions, by the articles in the *Moniteur* which the prefects posted on the walls. France saw these victories without pleasure, without pride. She knew at what price they were bought. There was no longer any real love of country; the Revolution had drowned it in torrents of blood shed in its name. The unmeasured extension of our frontier had weakened the national feeling. . . . Since the battle of Marengo, there had been nothing for France in the enterprises and the victories of Bonaparte." Each victory of Napoleon cost France the loss of a liberty. M. de Vitrolles had made the acquaintance in Paris of a few men who dared to express doubts on the final triumph of the Napoleonic policy. One of them was the Duc de Dalberg, nephew of the Archbishop of Mainz, who had been made Duke and Councillor of State by Napoleon; the others were the Abbé Louis and the famous Talleyrand, who was a friend of Dalberg. Mme. de Vaudemont, the last representative in France of the old house of Lorraine, had a salon where they often met. The secret enemies of Napoleon had no relations with the Bourbon princes. One evening, at Mme. de Vaudemont's, Dalberg, furious with the Emperor for an insulting speech made to his wife, spoke of them to Talleyrand: "Well," said he, "how will they be for us?" "Have they," added the Abbé Louis, "forgotten the mass of the 14th of July [the mass of the Federation, at which Talleyrand had officiated as Bishop of Autun]?"

The English papers were prohibited in France. From a number which fell into his hands, however, Vitrolles learned that M. le Comte d'Artois (who became Charles X.) had left for the Continent on the 25th of January, 1814; the Duc d'Angoulême had also left England for the

south of France. Vitrolles resolved to leave Paris and to try to find Monsieur. When he took this resolution, negotiations were beginning at Châtillon between Napoleon and the allies.

"You see," said Talleyrand to Dalberg, "how ignorant Europe is of our situation—ignorant of what she can do, ignorant of what she ought to do. She opens negotiations with the man she ought to crush, and at the moment when she could end with him. He will be more clever than Europe; peace will be signed, and what will become of us? He suspects our wishes, he will never forgive us. We must at any price instruct the allied sovereigns, and let them know the danger of these negotiations. But how? How can we find a person who can come near them, inform them, reassure them, and give them courage and hope?"

In vain did Dalberg ask Talleyrand to give Vitrolles some letter of introduction, or even a seal with his arms. Dalberg himself wrote in sympathetic ink two words on a portfolio, which were to be shown to Count Stadion, Minister of Austria at the Congress of Châtillon (these two words were the names of two ladies whom Stadion and Dalberg had known at Vienna); he gave Vitrolles also two lines for Nesselrode, and a seal with his arms. Vitrolles was not accredited in any other way, and Dalberg even asked him not to name him to Metternich, with whom he was not on good terms. Vitrolles took a passport for the Basses-Alps, and started under the pretext of going to his family. He left on the 6th of March by diligence. I will not relate here all his adventures on the way. He succeeded in reaching Count Stadion, who told him at once that Metternich could not be kept out of the secret. Stadion was very hostile to Napoleon, and entered readily into the views of Vitrolles; he put him in communication with Metternich and Nesselrode. The two names which Vitrolles had shown had convinced him. Metternich was at first more doubtful, but he said to Vitrolles: "If you were sent here by Bonaparte or by Savary, I would speak to you as I will now: all is open now, our intentions are known; we wish them to be made public." He explained how the alliance had been formed against the boundless ambition of Napoleon. The conditions of peace could only be such as would secure the equilibrium of Europe: Russia, Austria, France must be well balanced; Prussia must acquire new territories; Holland must be again a nation. Vitrolles answered that "'no diplomatic combinations, no treaties could secure peace; the wishes of France must also be consulted. She was tired of Napoleon, who had himself been obliged to prorogue his Chambers. . . . In short, there could be no peace with Bonaparte, and there could be no France without the Bourbons. . . . The ministers looked at each other: it was the first time that the name of Bourbon had been pronounced. After a little silence, Metternich spoke first and said: 'We have been in France for two months, and we find among the people nothing to justify your declarations. There seems to be no regret for the past, no expressions of discontent with the present. We have, it is true, seen a few *émigrés*, who ask us very timidly if it is our intention to bring back the King. But they leave us without a word when we tell them that we have no such desire.'"

Vitrolles was playing a terrible game. It was quite clear that his mission could not long be kept secret from Napoleon. If the kings and emperors made their peace with him, Vitrolles was a lost man: he could only save his head by a voluntary exile. We cannot wonder if, once engaged in his dangerous enterprise, he put all his energy into his work. What Metternich said was very true, and we have seen the same thing in our times. So many revolutions have swept the soil of France that the peasant is always cautious and uneasy; he dares not say what he hates or what he loves, what he fears or what he hopes. After the war of 1870, when the Germans covered the third part of France, I went from Brittany to Bordeaux, and from Bordeaux to Paris, and I was not able anywhere to discern what were the real sentiments and wishes of the peasantry touching the future of France. Metternich in 1814 felt how dangerous it would be for the allies themselves to give a new government to a conquered nation. The stigma of foreign pressure was always on the Restoration Government, and it soon became a vulgar invective to say that the Bourbons had been brought back in the "fourgons des Cosaques." The conversations of Metternich with Vitrolles possess deep interest, as they show us the principal statesman of the Coalition face to face with numberless difficulties. Metternich discussed with Vitrolles the new frontiers of France. Vitrolles said that it would be fatal to the Bourbons not to give them as much as would be given to Napoleon. Metternich did not deny it; he admitted vaguely the possibility of giving to France a part of the countries lying between the Moselle and the Rhine, and even to add Luxembourg to it. As for Belgium, he would not hear of it, especially on account of Antwerp.

Vitrolles's mission was two-fold: it was not enough for him to see the allies, he wished to see the Comte d'Artois. He first wrote to him, and Metternich offered to send the letter through the Austrian generals who were in Franche-Comté. While he was waiting for an answer, he had an interview with the Emperor Alexander; he spoke to him as he had done to Metternich. The Emperor was cold. He praised Vitrolles's loyalty to the French royal family, but added: "The obstacles which now separate the Princes of the house of Bourbon from the throne seem to me insurmountable. They would come back embittered by misfortune, and, even if they could sacrifice their resentment, they could not moderate those who have suffered for them and by them. . . . The spirit of the army, so powerful in France, would be opposed to them; the new generations would have a spirit adverse to theirs. The Protestants would not see their return without fear and without opposition. The spirit of the times is not with them." Then he added suddenly: "Besides, do you know the Princes of the royal family?" Vitrolles said that he did not; that as a soldier in the army of Condé he had only known the three generations of this family. The Emperor said: "If you knew them, you would be persuaded that the burden of such a crown would be too heavy for them." He then spoke of other candidates—of Bernadotte, of Eugène Beauharnais—even of a republic: "A republic, wisely organized, would perhaps suit the French mind. It is not in vain that ideas of liberty have germinated so long in a country like yours." Vitrolles was astounded; he almost despaired of his cause. He spoke with eloquence, with fire, and he saw by degrees that his emotion was communicative. He told Alexander not to make an ordinary war, a strategical war—to make it political; to go straight to Paris, and, once there, to allow French opinion to manifest itself: "I will leave my head in the hands of your Majesty if this opinion does not pronounce itself for the reëstablishment of monarchy." Alexander was seduced by this idea of making the war more political than strategical, and to show himself in Paris, not as the enemy but as the friend of the French people. "I leave to-night," said he, "for the headquarters of Prince Schwartzenberg. I promise you that our conversation will have great results."

The negotiations at Châtillon soon came to an end. Vitrolles became all the more important. The allied ministers were so isolated that they were extremely anxious to enter into relations with Frenchmen. The sovereigns declared that they would treat no more with Napoleon, and Vitrolles was among them the voluntary advocate of the Bourbons. They all felt or thought that behind Vitrolles was Talleyrand, who had so long been the arbiter of Europe. Vitrolles had gained much, but so far he had not bound his action with the action of the Princes. He saw Monsieur for the first time at Nancy. His credentials to him were a few words written on a piece of gauze by Mme. de Durfort, a letter of Metternich, and a ring with the device "God and the King." M. de Vitrolles was well received. He says himself, not very modestly: "I brought a kingdom, and it was felt." He urged Monsieur to seize at once the royal authority in the provinces in the name of the King, to summon all his friends, to form an administration. He explained to him men and things in France. All was new to Monsieur; he was a stranger in his own country. On his side, he explained to Vitrolles who these Bourbons were whom he had undertaken to replace in their old station.

GERMAN POLITICS.

BERLIN, January 29, 1884.

OUR political situation has not undergone any essential change since the beginning of the new year. People begin to enjoy peace, and the apprehensions of war into which they had been frightened last year are losing ground. The general aspects are, in fact, more cheerful, although the Government continues to undo what was done in the decade of 1868 to 1878. The Landtag is discussing new taxes, which in the interest of our agrarians are to be laid on the capitalists and the "bloated bondholders"; and Bismarck, although daily receiving his own ministers and foreign ambassadors, passes his leisure hours in reading the works of the Abbé Lamennais. Think of that mystical, obscure, and visionary priest, and the sober, empirical, and clear-headed Chancellor! Whoever takes part in public affairs is uneasy if not despondent, and nobody knows how the present state of affairs will end. One expects wonders from the death of the Emperor; another waits for the retirement of the Chancellor, or for the return to his policy of former days, although these latter events will never happen. The transactions of our parliamentary bodies are dull and uninteresting; in short, it is the reaction of the popular mind against the enthusiasm of the late war, and against the excitement of roused passions. The same state of feeling prevails in other nations, too, which have undergone heavy convulsions and internal revolutions. Under another name, perhaps, but in essentially the same way, you likewise witnessed the same anxieties and the utter sterility of the law-making power for several years after your war was over. Whatever Bismarck could do he has done to discard the laws of his liberal period; but he is far from having been successful. Here and there a new reactionary plank has been inserted into a section of an old liberal law: but as yet he has not been able to destroy the ground and framework. On January 1st the new law regulating the industrial and professional trades (*Gewerbe-Ordnung*) went into effect. One of its chief amendments is the restriction of the hitherto unembarrassed movements of peddlers and commercial travellers. The police have succeeded in dealing with them as severely as possible. The peddler, by the new law, is required to show his stock to any police authority, and to give a catalogue of his books. In Frankfort on the Oder our holy Hermandad took offence at and confis-

cated, among others, two prominent and (to use the police slang) two "moral" magazines, viz., Spemann's *Vom Fels zum Meer*, a monthly of the character of *Harper's Magazine*; and Schorer's *Familien-Blatt*, a weekly, beautifully illustrated, and full of useful information. The former has 48,000 and the latter 75,000 subscribers. The police did not consider them moral enough, and forbade their sale by peddlers. The cry against this outrage was so loud that the Regierungs-Präsident (Chief of the Government Circle) had to apologize for his subordinates. In the Kingdom of Saxony the provision of the law, that peddlers infected with contagious diseases, and of a revolting (*abschreckenden*) appearance shall not be allowed to solicit customers, was, without a shadow of law, extended to commercial travellers, who were without notice taken before the police and stripped, in order to be searched and examined. In this instance, too, the Government was compelled by general indignation to revoke an unjust interpretation of the law.

You have no idea of the indifference, if not stupidity, of those whose interest lies in this direction. If they are not injured personally, they do not move, and even take delight in the damages suffered by others. It is a sorry tribute to the intellect of German publishers that, instead of fighting betimes the attacks of the reactionary parties on the free sale of books, and instead of standing like one man in the maintenance of their common interest, the most prominent among them pointed out those whose publications ought to be prosecuted—provided, of course, that their own books and periodicals remained undisturbed. A friend of mine who is a member of the Reichstag, and manfully fought for free colportage, told me that he had received dozens of remonstrances alleging that he had been too radical in his views, that he had better confine himself to the confiscation of obscene literature; and now the first blow of the police has fallen upon one who remonstrated in this way.

The new bill for regulating hunting (*Jagdordnung*), too, now before the Prussian Landtag, has no prospect of passing. It is dictated by the most feudal views, for the exclusive benefit of the large eastern landholders. You can have no idea of the ravages made by the deer and wild boar on the fields of poor people in the neighborhood of deer parks, who nevertheless are not allowed to guard themselves against the game by shooting it, and are even criminally punished for so doing. A majority of Liberals and Conservatives have declared themselves against that bill, the latter in anticipation of their defeat in the coming campaign if they should sustain such a law. One after another the Conservatives dropped off when they saw the impossibility of carrying the measure for the Government.

The conflict with Rome is further than ever from being settled. *L'appétit vient en mangeant*, and the Ultramontanes are still asking more, while the Government answers that it has done enough to show its good-will toward the Roman Church. The agitation of our Ultramontanes is therefore kept up with the old phrases and with empty declarations. On the other hand, Minister Gossler, a few days ago, in reply to an interpellation of the Centre in the Landtag, positively declared that the two most obnoxious archbishops—viz.: those of Cologne and Posen—would never be pardoned, while the Bishop of Münster had lately been allowed to return to his flock. This is the first sign of manhood which a Prussian Minister has manifested in this respect for the last four years. The "Chaplain's Press" of course cried out that the days of Falk had returned, and that the Roman Catholic Church was still a victim of Prussian cruelty. This is sheer nonsense. I think that the Government has yielded much more than was necessary. The charge, too, that Catholics, in consequence of the removal of their disobedient priests, were unable to worship, is just now a shallower pretext than ever, since hundreds, if not thousands, of clergymen (as many as have applied for reinstatement) have been reappointed. Besides, a Government cannot reasonably be called partial, and unjust toward the Catholics, which among its commanding generals, ministers of state, and high civil dignitaries numbers proportionally as many Catholics as Protestants. The real fact is that even the most tolerant grows tired of concessions. Bismarck, of course, is only indulgent so far as he can gain valuable considerations. If he gets them, he will do everything—*quantum mutatus ab illo!*—to please Rome. He holds a few more trumps in his hand, and if he can play them to advantage he will do so without the least scruple. His end is to gain the parliamentary support of the Centre, which at present, by coöperating with the Conservatives, commands a small majority in the House. Any other reason does not influence him. People have consequently lost all confidence in their former leader. The whole conflict with Rome is already stagnant. If the Chancellor ever again appeals to the Liberals, he will meet with utter coldness and indifference. The only question of interest in this diplomatic game of bluff is which of the antagonists will be prompt and sharp enough to outwit the other. In all other respects the details of the struggle are disgusting, and do not deserve notice.

The Conseil Supérieur (*Volkswirthschaftsrath*) has once more been in session during the last few days and will shortly close its sittings. It was convened to give its opinion on the bill of accident insurance by and for the different trades. What distinguishes this august body from parliamentary assemblies is, that even before arriving in Berlin they are earnestly entreated to despatch business, and not to sit longer than a few days. As even the Landtag refused to grant salaries and travelling expenses to these gentry, they are politely invited by the minister to come at their own expense, and, despite all obloquy, to sacrifice their valuable time for so patriotic a purpose. But, alas! in this sinful world, appeals of this sort are at a heavy discount, and only 50 per cent. of the immortal original number packed their lunch-boxes and purchased a ticket for Berlin. The Stettin porter who had been appointed by the King's pleasure, could not afford to come, being short of petty cash, and to another of this meritorious class of private officers the company in whose service he earns his daily bread refused him the desired furlough, under the pretext that he was such a consummate blockhead that he would discredit the town from which he came. Why the other councillors do not defray the travelling expenses of their poorer brethren, I cannot understand. In my opinion a gentleman, if he be only a porter, who knows all about trade and commerce, manufacturing and shipping, agriculture and finance, railroad matters and telegraphic improvements, and can make any number of speeches or give opinions on them, is worth at least a dozen crowns. Let me, finally, state that the majority of these sages were from the beginning in conflict with their creator, and were even so disrespectful as openly to oppose his bill. The fact is, that at the head of this conspiracy (in Bismarck's eyes every male citizen is a conspirator who does not fully and most unequivocally endorse his views) stand the manufacturers. They smell the rat: there is money in the bill—not for, but against them; and the Government will finally compel them to foot it. †††

Correspondence.

THE 'BREADWINNERS' AND 'DEMOCRACY.'

To the Editor of The Nation:

Sir: The authorship of the 'Breadwinners' is, as I see by a paragraph now going the rounds of the press, to be kept from the public. While I do not intend to hazard any guess as to who the author is, I would like to surmise that the 'Breadwinners' is by the same hand as 'Democracy,' the novel which some years ago had a certain degree of success in this country, and a very great success in England. 'Democracy' was a sketch of Washington social and political life, evidently written by some one familiar with it. The 'Breadwinners' is a sketch of Cleveland social and political life, also written by one quite at home in it. I am by no means an admirer of either book; yet in both there is the same strong, coarse, Nast-like drawing of aspect and characters in social and political life which comes directly home to every people. The work is crude, and there are few fine touches to it. It is always provokingly near the verge of being very good, and yet distinctly never is very good. In 'Democracy,' as in the 'Breadwinners,' we feel conscious of the same keen, observant eye, working through a hand which is quite lacking in training, and which also, either naturally or from indolence, is unequal to a sustained effort. I fancy it would be safe to guess that the author had worked on a newspaper. He certainly has seen a good deal of politicians, and was never a man of business. That he was once in the army is plain. Who he is, I have not the remotest idea. A.

Boston, February 8.

MONGOLIAN AND INDIAN NOSES.

To the Editor of The Nation:

Sir: In your issue of January 3d, the critic of Mr. Gilmour's 'Mongols' hazards the supposition that their flat noses may have arisen from their peculiar way of eating meat. Allow me to say that it is the custom of the wild Sioux to partake of flesh in this way—in fact, was the universal custom; but their noses have remained a most prominent feature, and the more one "knows" of the Dakotas, the more the exceeding great number of extremely large noses impresses him. Roman noses are a prevailing feature, but the hooked or (what we are led to suppose from illustrations of the nose of our Jewish brethren) Jewish nose is well represented. The "turned up," or Milesian, also is not uncommon, but always large and prominent. So the perilous mode of conveyance that Mr. Gilmour describes cannot have modified the size of his Mongolian's nose.—Very truly yours,

M. A. Swift.

South Le Beau, Dakota Territory,

GUIDES TO WHIST-PLAYING.

To the Editor of The Nation:

Sir: I am past forty and have begun in time to prepare for a happy old age by learning whist. Now, can any of your readers give me the name of a manual which makes a sharp distinction between those playing-rules laid down for the sake of securing uniformity of practice among players, and those other playing-rules by following which a man wins more tricks than he otherwise would? Allow me to make my mean-

ing clearer by referring to two practices which prevail among drivers. The driver turns to the right (in America) on meeting another vehicle, and not to the left (as they do in Rome), just because "stern custom has decreed" it shall be the right and not the left; but he sits on a high cushion for quite another kind of reason—namely, in order that he may see the road better.—Yours truly, V. R.

CAMBRIDGE, MASS., February 11, 1884.

[So far as our information goes, there is no work on whist which treats separately the two classes of rules; but as all good books on whist give the reasons for the rules, the learner may distinguish and classify for himself without great difficulty. In Mr. Buckland's most elementary and excellent 'Whist for Beginners' (London: Allen; New York: Scribner & Welford), the advice as to playing is ample, and the advice as to "uniformity of practice," by which we suppose our correspondent means the scientific method of playing both partners' hands as one, is necessarily very slight. Both "Cavendish" and the slightly bumptious but very acute book on 'American Whist' (Boston: Osgood) ought also to be consulted.—ED. NATION.]

THE ABUSE OF LAW-MAKING.

TO THE EDITOR OF THE NATION:

SIR: The excellent article in last week's *Nation* on the subject of "Excessive Legislation" leads me to call attention to the mischievous competition, especially manifest of late among members of the Legislature, in getting laws passed, to the end, chiefly, of gaining credit with constituents for industry and efficiency. At the close of each session, lists of achievements in this line are paraded by members or their friends, with something of the pride shown by savages in multiplying the scalps of enemies on their belts. Last year most of the newspapers hereabouts published such lists, and the public were called upon to admire their lawgivers according to the degree of their activity and success in lumbering the statute book. The worth, the need, of the laws thus held up as passports to popular confidence and esteem seemed to be regarded as of secondary importance, or of no importance at all. Now, members of the Legislature are not alone at fault here. The voters must take a good share of blame to themselves for the establishment of this foolish test of legislative usefulness, and this fact shows the necessity of just such work as is being done by the Society for the Promotion of Political Education.

JOHN H. MAGEE.

SCOTTSBURGH, N. Y., February 17, 1884.

DOCTORS IN COURT.

TO THE EDITOR OF THE NATION:

SIR: That doctors have in some cases forfeited the confidence of all respectable people by consenting to certify to the insanity of people whom they knew to be sane, is doubtless true. That they have also frequently made mistakes in their diagnosis of insanity is likewise true.

The true remedy against the evils of the present system would, it seems to me, be found in the appointment of a Commission on Lunacy in each State. This Commission might be composed both of medical and non-medical men; but it should be composed of men of recognized integrity, intelligence, and impartiality. To this Commission appeals should be taken from the decision of the physicians who have previously adjudged a person insane, when such decision is questioned.

It seems almost self-evident that men who have devoted much of their time to the study of mental diseases, and who have had long experience in dealing with the insane, should be better qualified to decide whether or not a man is insane than a jury as ordinarily composed. Yet any one would naturally infer from reading the article entitled "Doctors in Court," which appeared in your issue of the 7th inst., that you believe that the scientific study of mental diseases naturally disqualifies a man for holding the position of an arbiter between the person suspected to be of unsound mind and those who have caused him to be confined in an asylum. Certainly you will be the last to admit that training in any other vocation, except that of the "alienist," disqualifies a man for forming a sound opinion upon questions connected with that calling. Why an exception to the general rule should be made in this particular case it is hard to understand.

The rights of the insane must be respected, but the safety of the community at large must be respected as well. If, therefore, a man has been proved to be under the delusion that he is constantly annoyed by imaginary enemies, and shows a tendency to mistake real persons for these imaginary enemies—as I believe was actually the case with regard to young Meredith—the responsibility of giving him entire freedom of intercourse with his fellows is a very grave one. Such a person demands and should receive our warmest sympathy, but it is not a case that should be put on the same footing as the case of a real or supposed criminal. The fact of the existence of such a form of insanity being once satisfactorily proved by the unanimous consent of those best qualified to give an opinion upon the subject, it would seem that an appeal to the sympathy of the jury was no longer in place, and that an intelligent judge could no longer have any doubt as to the action that should be taken in the matter.

In conclusion, the writer must confess that he was surprised to find that the editor of the *Nation*, a journal which has always borne the reputation among American journals for enlightenment and liberality of judgment, gave countenance to the vulgar prejudice against trained medical experts. S. H.

PHILADELPHIA, February 9, 1884.

["S. H.," it is hardly necessary to say, is a physician. We shall not attempt to discuss his "surprise" at our giving countenance to what he calls the "vulgar prejudice" against medical experts, because he does not undertake to give any reason for this emotion on his part. We have given several reasons for thinking that the prejudice has a good deal to rest upon; *e. g.*, that alienists are in most cases paid to make out a case of insanity or the reverse. If we are right, the prejudice is not vulgar. On the other hand, "S. H." should, if we are wrong for reasons which he is able to state, give them, and not confine himself to expressing surprise—an inconclusive species of argument. That a Commission on Lunacy, composed of medical and non-medical men, would give us any better machinery than the courts of justice, aided by physicians, now afford, we doubt. Probably, as such bodies are generally constituted, it would be inferior. But if "S. H." thinks the prejudice against alienists vulgar, why in the world does he want any non-medical men on his commission?—ED. NATION.]

THE NEW PUBLIC-LANDS PROBLEM.

TO THE EDITOR OF THE NATION:

SIR: In your issue of January 24th, you refer to the resolution passed by the House, under the lead of Mr. Holman, which moots the question that all the public domain shall be "disposed of under the provisions of the Homestead law only." It is a sad misfortune that so many questions of real importance prove the foot-ball of supposed partisan advantage. The dealing of the Government with the public lands is not even discussed in Congress according to its merits, but wholly on the supposed effect upon the voting public of the speeches made and policy pursued.

During the present session of Congress one bill looking toward a reconsideration of the public-land question has been offered by one of the new members from Kansas, Judge Peters. It provides for the classification of the public lands into agricultural, grazing, timber, and mineral lands. Whether its provisions are wise and practical I know not, as I have not seen the bill; but the idea of thus classifying the lands is wise. In Kansas the lands west of the 100th meridian are utterly unfit for agriculture unless the land be irrigated, and yet the present policy of the Government assumes that all these lands are as good for agricultural uses as those 100 miles east of them; and there are bills before Congress which propose to repeal all modes by which any one can secure title to any of said lands save "under the provisions of the Homestead law only." There are settlers at Dodge City, almost on the 100th meridian, who have for ten years tried to raise fruit and vegetables without the use of irrigation, and in no year has it proved possible. West of Dodge City, forty miles, is the settlement of Garden City, which depends wholly upon water from the Arkansas River to raise the crops.

Professor Snow, of the Kansas State University, in a recent article on the "Climate of Kansas," says: "Kansas may be divided into three sections in reference to its rainfall. . . . Western Kansas has from ten to fifteen inches of an average annual precipitation," which is altogether inadequate for agriculture. Kansas lies between longitude 94° 45′ and 102°; hence, west of 99° 35′ of longitude, according to Professor Snow, the rainfall is less than sixteen inches. In Colorado, with its 106,475 square miles, New Mexico, with 124,450 square miles, Arizona, with 130,800 square miles, Utah, with 109,600 square miles, Nevada, with 83,500 square miles, as well as the western third of Kansas, with 24,333 square miles—in all 579,158 square miles—there are no lands (or so nearly none as not at all to influence the problem) which can be cultivated for agricultural uses, save by irrigation; and to this immense aggregate may probably be added Wyoming and much of Montana and Idaho. One would suppose the time had arrived for the statesmen at Washington to at least devise a new public-land policy for the so nearly wholly changed character of the lands with which the Government has now to deal. The bill of Judge Peters, above referred to, may be the beginning of some sensible consideration of the question, by classification of the lands; and this need not be either an expensive or a difficult matter.

The amount of land in the States and Territories last above named which may be irrigated is not, relatively to their aggregate areas, large, but very small. That these lands should be held for disposal only "under the provisions of the Homestead law" is undoubtedly wise; but the limit of acreage to be taken by any one person should be eighty acres, in lieu of one hundred and sixty acres; for settlement must be more dense when irrigation is used, and eighty acres

would be all an ordinary farmer could utilize. The rest of the lands—nine-tenths at least of the total area—not counting the inconsiderable number of square miles of mineral and timber lands, are fit only for grazing. The natural grasses found will not sustain more than one steer to each ten or fifteen acres of land—or sixty-four to thirty-three steers to the square mile. This seems a small number of animals to be supported on a tract of land one mile square, and yet the number here stated is too large rather than the reverse. I should doubt the wisdom of selling these lands outright; but why not lease them for a term of years? Is not the whole country interested in the production of abundant, healthy, and cheap beef? Nowhere in America, at least, if in the world, can cattle be bred and put into the market so cheaply as upon the great plains which lie at the foot of the Rocky Mountains and the ranges west of them. These cattle are not the fat cattle from which the choice cuts are made, but the common meats of the packing barrel or the cheaper meats of the butcher; or they supply to the feeders of cattle, at less price than the farmer of Ohio or further e st can raise them, the animals which are fatted for export or the tables of those able to pay for good meat.

To-day the cattle men are buying up the water fronts, and great corporations or men of large means are securing control of the water, and push the man of moderate capital off the plains. All this can be obviated, and men of small capital can embark in the grazing of cattle, if the Government will only insure them some right of possession through a lease; and with the right to fence, not only more cattle can be raised, but at a less cost, for the markets of the East. Besides, the Government, leasing the land for not more than fifteen years at a time, can watch the effect of grazing on the wild grasses and prevent their destruction, which is far more important than will seem to persons unacquainted with the plains. As a nation we have dealt with our forests on the principle of "after us the deluge"; and unless a halt is called upon the grazing of the plains, and the use of its grasses is regulated, we shall see our cattle interests rise very high and rapidly, and then collapse as suddenly.

FRONTIERSMAN.

LAWRENCE, KANSAS, February 14, 1884.

THE CAUSE OF THE DEPRESSION IN BUSINESS.

TO THE EDITOR OF THE NATION:

SIR: In your issue of this week you state that the present depression in trade has been caused by abnormal activity and overproduction in certain branches of business, and that what is needed is "a redistribution of employments." This is in accordance with the accepted theories of political economy. If we would accept these theories, we must believe that the cause of the present troubles lies in the fact that we have been busy producing the wrong articles; that we have produced what was not wanted, and have failed to produce what was wanted; and that all we have to do now is to turn round and produce the things that are really called for, and all will be well again. The difficulty with this theory is that it requires us to believe that there are certain wants and demands now unsatisfied and unsupplied, not because of the lack of means to purchase but because of the scarcity of the thing to be purchased. But if there are any productions of human labor that are now scarce, they must command high prices and furnish large profits to the producers; and any capital that might now be unemployed would be hastening to secure a share of those profits. As a matter of fact, however, there is in this country at the present time an immense amount of unemployed capital, and there are no symptoms that even the shrewdest and most enterprising of its owners have any idea that there is any possible field in which they can employ it with profit to themselves.

If, however, we consider the cause of our present troubles to be an abnormal activity and overproduction, not in *certain classes* of business, but in business *generally;* if we consider that the wealthy and thrifty among our people have endeavored to do more business than the condition of the country permitted, to create more productions than the pecuniary ability of the rest of the community enabled them to consume, we have an explanation that fits the present state of the facts. A large portion of the community have been eager to accumulate wealth, to make profitable investments, to save up their income or their earnings and put them where they should bring annual returns. People have seen that factories produced for their owners large profits, and they have forthwith proceeded to build new factories in the hope of securing for themselves similar profits. In like manner capital has hastened to build new railroads, to erect new warehouses, and to extend and multiply all branches of trade and business. But the fact has been overlooked that profitable business and profitable production cannot be increased indefinitely without a corresponding increase of customers and consumers. While there has been recently an immense increase of production, the wages of the poor, which fix the limit of their ability to purchase and to consume, have not been largely increased, and the rich have sought rather an increased accumulation of wealth than a fuller gratification of their daily wants and desires. Thus, instead of one factory producing and selling at a profit a supply of products that rather fell short of than exceeded the demand for them, we have had two or three factories producing a supply much in excess of the demand, and consequently competing with each other in the endeavor to sell their surplus stock, and selling it at no profit or at a loss. Finally the factories have cut down the wages of their employees or have dismissed them altogether, and the capacity of the poor to purchase and to consume has thus been largely taken away from them, while the inclination of the rich in that direction has been lessened by the loss of their usual dividends, and thus the original mischief of overproduction has been increased and intensified.

Briefly, the theory here suggested is this—that our people have been trying to invest more capital profitably, to do more business, than their capacity and inclination to consume made possible, and that the result has been to seriously reduce that capacity and inclination, and to destroy the annual returns that capital hopes to receive from its investments and from business.

U. H. C.

BOSTON, February 9, 1884.

CABINET OFFICERS IN CONGRESS.

TO THE EDITOR OF THE NATION:

SIR: In his letter of January 14 (*Nation*, No. 969) Mr. C. A. Towne, after stating with great force the advantages of giving to the Cabinet seats in Congress, gives expression to doubt on one point: "Whether it would also in time render necessary the incorporation of the other principle, ministerial responsibility, into our system, and whether such a result is to be desired, are questions pregnant with importance, and from whose discussion no harm can come." Upon this mild encouragement, and as the subject seems to be attracting some attention, I should like to say a word.

There are three attitudes which might be assumed by Cabinet officers in this novel position. First, they might be mere witnesses appearing in public session, just as they now appear before committees. But that would probably not last long, as the Secretaries would be attacked by the Opposition and taunted with the lack of any policy, while the majority would be compelled to base their defence on the support of the Secretaries, who might, therefore, secondly, be obliged to assume the guidance of legislation. Of course, no Secretary could permanently hold his place who did not command the confidence of the House; and, thirdly, in that case either individual officers or the whole Cabinet might resign and new appointments be made by the President. Now in England single members of the Cabinet do occasionally resign, yet the body in general acts as a whole and makes itself responsible for each member. This has obviously great inconveniences, as a mistake in foreign policy or finance or local government may upset a Ministry which, on the whole, commands the confidence of the country. I have never seen any satisfactory reason why this should be, but presume it arises from the facts (1) that the Ministry is practically appointed by and wholly dependent upon Parliament; and (2) that the Premier has no official authority or leadership, and that the connection is one of voluntary agreement. I can see no reason why an elected President, with whom the choice and responsibility must ultimately rest, should not change his officers singly. But suppose the whole Cabinet should resign, why should not the President appoint another, even from the opposite party, just as M. Grévy does in France? The effect upon the President's position I will consider presently. The difference of the English Ministry in case of a defeat, when they believe that the country is with them, consists in a dissolution of Parliament; and the difficulty of getting a working Ministry in France is said to lie in the circumstance that the Chamber cannot be dissolved without the consent of the Senate, and thus a defeated Ministry cannot appeal to the country. Of course, our House of Representatives cannot be dissolved, but the same purpose might be reached by our short terms. Unless an English Ministry is met immediately after an election by a hostile House (in which case it must resign, as our Cabinet would), it is rare that it does not hold out for a period of two years, when a new election would in our case come of itself.

The position of a President liable to choose his Cabinet from either party would certainly be different from what it is now, but then it is exactly what M. Grévy does without loss of dignity in France. Napoleon objected to a similar position in a constitution planned by the Abbé Sieyès, as that of a "cochon à l'engrais"; but then we do not want a Napoleon. Why should not the President be a dignified citizen, in a measure independent of party, and responsible only for the general conduct of government?

Another difficulty might arise from the fact that, if Cabinet officers were not members of the House, they might at any time by a defeat be sent into private life, and members might be unwilling to risk their seats by accepting office. Is it not conceivable that a district, proud of having its member a Cabinet officer, might make some arrangement for keeping the seat at his disposal in case of need?

These things show that it is impossible to foresee just what the course of development of the measure would be. Moreover, it is useless to try to pave the way by any kind of constitutional amendment. In the first place, supposing the end to be desired, there would be an endless and irreconcilable disagreement as to what amendments were required to obtain the

end. But the end is by no means desired. Congress, for obvious—or, if not obvious, yet inflexible—reasons, will be not only indifferent but hostile; and the hostility of Congress to any increase of responsibility, and therefore of power, in the Executive is mild compared with that which exists in the State Legislatures. To expect, therefore, to obtain favorable action in advance in this direction from twenty-seven State Legislatures would be considerably more visionary than to advocate a constitutional amendment prohibiting the manufacture and sale of liquor.

The first and simplest step in the process, and that which would give the country a taste that would soon grow into an appetite—namely, the presence of the Cabinet on regular days of the week on the floor of the House, just as they now appear before the committees—might be brought about any day by a simple resolution of the House. The rest might be left to time, or the first step cancelled if not satisfactory.

But even this step, simple as it seems, will never be taken by Congress of its own motion. The interests bound up with the present methods of doing business are too many and too strong to be overcome from the inside. When some strong public man shall become disgusted with the present anarchy and helplessness in Congress, and have the courage to take the stump and tell the people just what he wants, he will—provided he is of the requisite calibre, intellectual, moral, and physical—be astonished at the gigantic force which will place itself at his disposal. Butler's career in Massachusetts is pregnant with instruction; and if good men refuse to learn the lesson, they may be sure that bad men will take it out of their hands.

G. B.

Boston, February 15, 1884.

Notes.

The literary event of the week has been the actual appearance of "Part I.—A—Ant" of the 'New English Dictionary on Historical Principles,' edited by Dr. J. A. H. Murray for the Philological Society (Macmillan & Co.). This is not the time to do more than advise every one who can afford it to procure it straightway. The price of each part is $3 25, and this part, for example, deals with 8,365 words, of which 6,797 have separate articles. Its 352 pages represent a quarter of one volume of the six which the work is expected to fill. Dr. Murray's appreciation of his colaborers is very hearty and generous, and it is gratifying to observe his indebtedness to many Americans, foremost among whom is Mr. Fitzedward Hall. American authors, likewise, have been freely laid under contribution in the illustrative quotations. The typographical arrangement and impression are excellent, and worthy of the Clarendon Press. The division of the page is into three columns.

Townsend Mac Coun, 744 Broadway, publishes immediately 'The James Madison Letters, 1769-1838,' in four volumes, 8vo, a reprint of the Philadelphia edition published by order of Congress in 1865.

D. Lothrop & Co, Boston, will publish next month 'American Explorations in the Ice Zones,' by Professor J. E. Nourse, U. S. N.

Henry Holt & Co. have in press 'The Life and Poems of Theodore Winthrop,' edited by his sister.

Scribe's "Bertrand et Raton" is the latest of the French plays published by William R. Jenkins in the series "Théâtre Contemporain."

The fifth part of Mr. N. Ponce de Leon's 'English-Spanish Technological Dictionary' reaches the word Diamagnetism and the 240th page.

The submission of the Merv khans to Russia gives timeliness to the reprint by Funk & Wagnalls of O'Donovan's 'Merv Oasis.' Such is not exactly the new title, which is 'Merv,' the abbreviation suggesting the epitome which this reprint really is. The passages on pp. 184, 185, relating to the naïf dependence of the Turcomans on their very mixed and limited ordnance to meet "the possible arrival of the Russians," will repay rereading just now.

Charles Scribner's Sons have issued a very pleasing new edition of Dean Stanley's 'Lectures on the History of the Eastern Church.'

The English-reading public are to be congratulated on having an early translation of Düntzer's 'Life of Goethe,' by far the most valuable life yet produced. The task has been accomplished by Mr. Thomas W. Lyster, of the National Library of Ireland, who has proceeded in a very intelligent way, exercising considerable freedom in improving upon the original—as in quoting literally where Düntzer paraphrased—supplying foot notes which add decidedly to the value of the work, and a choice Goethe bibliography. Above all, he has furnished a copious index, which Düntzer, *more Germanico*, had neglected. The original illustrations are retained. The whole makes a plump 12mo volume of nearly 600 pages (Macmillan & Co).

Mr. Charles Francis Adams, jr., has put forth a new (third) edition of his "College Fetich," with supplementary matter in confirmation of his views derived from a speech to Yale Alumni by Mr. George S. Merriam, a paper by Prof. E. J. James, in the *Popular Science Monthly*, and from editorial articles in the same magazine.

In *Science* for February 1, Mr. Samuel Garman, of the Museum of Comparative Zoölogy at Cambridge, pictures a shark newly found in Japanese waters, which he is inclined to regard as typical of a new order, if not the possible "sea serpent" whose existence has given rise to so much controversy in our time. The head and shape of the body (which is less than four inches in its greatest diameter) make this a plausible suggestion, though the length of the individual in question is only five feet. Mr. Garman gives a fuller description of it, with a larger plate, in the Bulletin of the Essex Institute.

The *Art Interchange* of January 3 has a tasteful repeating design of Azaleas, which follows a happy mean between the realistic and the Morris types of decorative flower work.

The 'Plant Studies' of Mr. Haité, which we noticed some weeks since upon the prospectus, as an English publication for the use of artists (London, Quaritch), has in the first number quite justified our deprecatory prevision. The plates are poor realism and worse design, needlessly coarse in execution (considering the facility of getting good reproductions at present), and as a whole not so good as any second-rate draughtsman could do for himself.

Parts 95-100 of the new Brockhaus' Conversations-Lexikon (New York: L W. Schmidt) are double numbers, and, for an exception, have no maps, but the usual plates—on fowls, galvanism, garden tools, gas-machines, ordnance, etc. They carry the work well into the letter G. Among the longer articles are Prisons (*Gefängniswesen*) and Free-Trade, in which latter we find the following statement about our own country, to be denied or confirmed by those who think the task easy in the present condition of parties: "Since then (1861-67) the American tariff has, despite numerous changes, maintained a high protectionist character; and though a counter free-trade current is not lacking, the majority of the people are friendly to the protective system, because they see in it the basis of a special American political economy." Under Birth Statistics some suggestive comparisons between Germany and France occur. In 1872 the number of living births in the two countries was respectively 1,626,037 and 966,000. In the next eight years Germany never fell below its figure, France never equalled or surpassed its own but once, viz., in 1876, when 966 682 were born, against Germany's 1,757,701 (also a high water mark). Since that year France has steadily and alarmingly fallen off, in 1880 producing only 920,177. Four pages, or eight columns, are given to Galileo, which exceeds the space devoted to Frederick the Great. Gambetta (whose name Léon is said to stand for Napoléon) is disposed of in five columns, and Garibaldi in four and a half. Both characters are fairly judged, but the Italian, notwithstanding his anti-German filibustering in 1870, more sympathetically. Gallia is the chief geographical article. Fremont, Margaret Fuller, Fulton, Garrison, and Garfield are among the American names. The late President is commemorated as the "dark horse" of the convention of 1880, and just censure is passed upon his attitude toward civil-service reform in the closing year of his life.

The current number of the *Réforme Sociale* states that the correspondence of Le Play with M Charles de Ribbe, a prominent disciple of the founder of the school called "de la Paix Sociale," will shortly be published by the latter, who will prefix a study of M. le Play. In the same number we read that on moving day in Paris (January 8), 4,500 families went out of the city to 3,200 that came in—a hopeful sign, thinks the editor.

The *Bulletin de Correspondance Hellénique*, organ of the French school at Athens, for December, reaches us late. It has a double heliogravure of a pedimental series of Myrina statuettes, and one of a bas-relief found at Peiræus, with its usual *récolte* of inscriptions, articles on the Myrina discoveries by Pottier and Reinach, and inscriptions from Asia Minor, with a very interesting dissertation on the worship of Zeus Milichios (Baal Milik), by M. Foucart, head of the school.

Ferdinand Avenarius's 'Deutsche Lyrik der Gegenwart seit 1850' (noticed in No. 907 of the *Nation*) has deservedly reached a second edition. Owing to the limited scope of this anthology, no considerable accession to its list of poets was to be expected in a second edition; still, it is rather surprising to find it richer than the first by only two names and about twenty-five pages or poems. This slight addition hardly bears out the publisher's claim of "greatly enlarged" (*sehr vermehrte*); nor does it represent pure gain, for the admission of Wolfgang Kirchbach cannot be considered a compensation for the omission of Ernst Eckstein, who appeared in the first edition, and whose rising fame as a romancer may be supposed to stimulate interest in his poetry, entitled to recognition on its own merits. Wilhelm Hertz, the other new writer admitted, has deservedly found a place in this collection. The extract from his "Bruder Rausch" awakens a desire to see more of it—an unusual sensation in the case of the humorous pseudo-mediæval epic so successfully created by Scheffel, but worn threadbare by imitators. Herr Avenarius the editor has shown some not unpardonable partiality for Herr Avenarius the poet, three of whose poems are given in this edition, whereas the first contained only one. The two new ones are neither better nor worse than most imitations of Heine. Herr Avenarius has also given the biographical data concerning himself modestly withheld before. He is but twenty-eight years of age, and is, we believe, a nephew of Richard Wagner.

—We referred lately to a paper in the *Revue Historique* on Napoleon's scheme for making San Domingo the keystone of the French colonial system. Cromwell, before him, had built some hopes on the seizure of the same island, and had seen his expedition, too, end in failure. The story is retold in the January number of the *New England Historical and Genealogical Register*, by Mr. G. D. Scull, of Oxford, Eng., apropos of Edward Winslow's share in the expedition as one of three commissioners appointed by the Protector. This number of the *Register* is exceptionally rich in interesting matter. Mr. Dean's memoir of the late Col. J. L. Chester adds considerably to our knowledge of the career and character of this indefatigable antiquarian. His successor, Mr. Henry F. Waters, furnishes another batch of "Genealogical Gleanings in England," a large part of which relate to Maryland and Virginia, and have been annotated by a local authority. While many of the names are obscure, we meet with the Lees, of Virginia; Gov. Sir George Yardley, of that colony; John Rolfe (whose son Thomas, by Pocahontas, has numerous descendants in England); a collateral ancestor of Nathaniel Hawthorne; and Jose Glover, of the Harvard Class of 1650, "who was much beloved of the most if not all, and his departure much lamented of the most if not of all." That these "Gleanings" are beginning to bear fruit, is shown by the communicated "notes on abstracts already printed." Under the head of "Historical Intelligence" we read that Mr. Lyon Gardiner Tyler, of Richmond, a son of the ex-President, has ready for publication the 'Letters and Times of the Tylers, Father and Son,' a work in two volumes, 8vo, obtainable by subscription.

—The latest report of the Boston Record Commissioners, their ninth, contains every entry of birth, death, and marriage recorded for that city in its own records and in those of the First Church from 1630 to the close of the century—the two often overlapping and checking each other. This task has been admirably performed by Mr. William S. Appleton, and the mass of names is made available for research by a full index, in which all the eccentricities of spelling are preserved, as, Mirack, Mireck, Mirecke, Miriack, Mirick, Miricke, Myrick. Occasionally, but not as a rule, the occupation or station of the deceased was recorded, as, "Paul Mitchell a fisherman living at Crafthold in England," "Richard Done neger servant to Capt Robt. Keayne"—that Keayne to whose generosity Boston owes her Old State House. The relationship was now and again quaintly indicated, as, "Ruth of John Ruggles husband to our sister Ruggles sometime wife of Nicholas Phillips." The clergyman's name frequently occurs in case of marriage, or the magistrate's, as, "Mr. Richard Mather Pastor to the Church of Dorchester & Mrs. Sarah Cotton widow were married 26th—6th month by John Endecott Govr." (1656); or, "Samuel Veazey & Mary Virgoose [the name has been sought to be associated with Mother Goose] were married by Saml. Sewall Esq. Assist. Nov. 25" (1691). Sewall's own rapid progeny may be traced here. So we find the birth record of "Cotton of Mr. Increase & Mariah Mather born Feb. 12" (Feb. 15, First Church baptismal date), 1662; and of his first child, "Abigail of Cotton & Abigail Mather, born Aug. 22" (1687); and find him already uniting others in wedlock in 1692, "Stephen Cross & Mary Lawrence" appearing to be the first couple. The volume affords endless scope for excursions like these, and is an invaluable aid to those who derive their descent from the early settlers of the Bay capital.

—The knowledge of the excellence of American manufactures is permeating the world. Poole's Index, for instance, has found an Italian admirer. Sig. Chilovi, librarian of the Marucelliana at Florence, has reviewed it (under the title "Una Curiosità Bibliografica") in the *Nuova Antologia*. After some just remarks on the utility of indexes, he sketches the history of Poole's, paying a compliment, on the way, to the "interest, originality, and practical wisdom" with which the contributors to the *Library Journal* have studied "the most intricate problems of the management of large libraries." He commends the execution of the Index, only wishing that when there were several entries under a single heading they had been arranged more scientifically, and that, in the preliminary list of reviews indexed, more bibliographical details had been given for the sake of foreigners not familiar with English and American periodicals. Sig. Chilovi of course turns to the Italian names, where he finds enough, both in the index and in the monthly supplements, to interest his countrymen. (He objects, by the way, to the entry of two articles about 'Niccolò de' Lapi,' one under Niccolò and one under Azeglio.) But his greatest wonder is excited by the success of the coöperative method. That nearly fifty libraries of the most diverse character, and stretching over a vast continent, should combine voluntarily to execute a work which no one of them could have undertaken single-handed, seems to him a fact worthy of note and imitation. But he despairs of seeing anything of the kind undertaken by the Italian libraries. One might, indeed, suppose that it would be much easier for them than for Americans to accomplish such a work, being all under the control of the Government. But it is not so. Europeans feel the inconveniences of centralization, and do not yet know its advantages; they have no initiative, because they expect everything to come down to them from above, so that their organization cannot effect as much as the American independence. Moreover, the Italian libraries, he complains, have not as yet even the periodicals to index. Only one has a periodical reading-room. They are, it appears, rich in materials for the study of the past; they offer few facilities for learning what is now going on in the world.

—Mr. Paul Lindau enjoys the reputation of being the cleverest literary man Germany has produced since Heine, so that the reader might fairly expect something exceptionally amusing and penetrating in the observations on this country which he has recently published in his magazine, *Nord und Süd*. The reader, however, who takes up the article in the expectation of finding something akin to Heine's remarks on England, will be disappointed—not, we fancy, from any inability on the part of Mr. Lindau to write a piquant article, but simply from the reticence natural to a courteous man who has eaten the salt of Mr. Villard's countrymen. This is to be regretted, for while we have been favored with an endless variety of British judgments, and a considerable number of French, intelligent and readable German criticism has been rare. Some of the national features which struck Mr. Lindau—such as the vast scale of our public works and the intense commercial energy of the American character—have so often been remarked as to make comment needless. But after these, he thinks, our predominant characteristic is hospitality, the enjoyment of which is marred, if marred at all, only by the necessity of paying for it. It is not, of course, vulgar, material payment which Mr. Lindau has in mind, nor yet personal flattery; but the appreciation of everything American demanded, not by individual, but, so to say, by corporate vanity. Our essayist seems almost painfully conscious of the obligation imposed by hospitality received, and could not be more careful to avoid saying what might prove disagreeable. But in view of the fact that he obtained recognition at home by his amusing satire on *Kleinstädterei*, viewed from the standpoint of a *Weltbürger*, it is probable that he would privately attribute this feature of American life, which he here explains by the newness of the country, to the want of corporate self-respect and individual *savoir-faire*. Of politics and literature, Mr. Lindau has nothing to say—he did not look even upon the outside of Washington and Boston, though he has a good deal to say of Kansas City. But he thinks our sleeping cars vastly inferior to European, and regards the existence of the elevated railways as a proof of the maladministration of justice, whose guiding principle seems to be that individuals have no rights as opposed to the interest of the community. He appears, indeed, to agree with the recently-expressed view of Herbert Spencer that the tendency of democratic government is not toward liberty, but toward despotism under another name.

—The English universities have of late years been roused to greater activity (or at all events to a greater semblance of activity) in philological work, as distinguished from mere schoolbook manufacturing. Those who know the constitution of those extraordinary complexes find excuse enough for scant production in the distracting engagements of boards, tutorships, syndicates; but German professors, when they once attain to high position, have at least as many entanglements. Ritschl complained, in the high tide of his professorial life, that he had only a couple of hours a day for philological work proper, and the same complaint is made by teacher after teacher at all the great universities. The Germans must make better use of their vacations than do English and American scholars. But, however this may be, it is pleasant to see that there is some philological activity at the great centres of English university life, and the second volume of the Transactions of the Cambridge Philological Society (1881–1882) gives a fair sample of the work that is done at one of these centres. To be sure, the most considerable paper, by Prince L. L. Bonaparte, on "Words in Latin and the Neo-Latin Dialects connected with the Vine," does not belong exactly to the Cambridge sphere, and is published in concert with the Philological Society of London. The others are nearly all scrappy—notes on points or authors; materials that one likes to put in print as a preparation for an extended work, or comments that one likes to save from the oblivion of the class-room. The reviews are an especially valuable feature for those who have not access to the many German journals. Mr. Leaf discusses Homer in 1881–1882; Mr. Hicks, Plato in England for the same time; Mr. Nettleship, Virgil; Mr. Postgate, Propertius—all approved specialists. English Etymology is written, as we should expect, by a German, Professor Zupitza.

—Everybody has read of the wonderful proficiency in the languages of the East of the late lamented Palmer, Lord Almoner's Professor of Arabic in the University of Cambridge, who explored and described the 'Desert of the Exodus,' and was finally murdered by the Arabs of the desert. Few people, comparatively, know that the former Lord Almoner's Professor of Arabic in the University of Oxford, and late chief editor of the London *Times*, Thomas Chenery, whose death was announced last week by the cable, was an equally rare linguistic phenomenon. Newspaper readers, unfamiliar with the circumstances, who heard at the close of 1877 that a Professor of Arabic had been chosen

to succeed Mr. Delane as manager in chief of the "Thunderer" may naturally have doubted whether the Lord Almoner's chair at Oxford had not been occupied for some years by a sham Orientalist. The very contrary, however, was the case, of which there is living—one might almost say, monumental—evidence in Chenery's Oriental publications, including his translation from the Arabic of Al-Hariri's 'Assemblies,' with notes, historical and grammatical (1867), and his edition of Al-Harizi's Hebrew translation of the 'Assemblies,' entitled 'Machberoth Ithiel' (1872). The introduction, partly in what we may call mediæval Hebrew rhymed prose, prefixed by Mr. Chenery to the latter work, is a masterpiece of imitative style, entirely worthy of the famous mediæval Hebrew translator himself, and, as the production of a non-Jew, has no parallel in all Hebrew literature. The consummate skill with which he there handles the mixed Biblico-rabbinical idiom of which the Jewish writers of Spain, in the best Moorish times, were the great masters, equals that displayed by Rückert in translating the same Arabic poet ('Die Makamen des Hariri') into the most surprisingly playful strains of his own living tongue.

—M. Auguste Vitu has followed up his considerable work on the house in which Molière died by a slighter one on the theatre in which he first acted in Paris. 'Le Jeu de Paume des Mestayers' (Paris: Lemerre; New York: F. W. Christern) is thus the second volume of a series of books on the "Archéologie Moliéresque," of which a description of the houses in the Halles or Market where Molière and Régnard were born is to be the third. M. Vitu notes (p. 57) that in the general reconstruction of Old Paris, and its transmogrification into the spick-and-span American paradise, many interesting landmarks have disappeared, and that the buildings which sheltered Molière between two hundred and two hundred and fifty years ago have now nearly all disappeared. In the present beautifully printed little book, as delightful in its typography as are all of M. Lemerre's publications, M. Vitu succeeds in showing that the tennis court in which the little company of actors, amateurs, and professionals who called themselves magniloquently the "Illustre Théâtre," acted from December 31, 1643, to December 14, 1644, occupied the space now covered by Nos. 10, 12, 14 Rue Mazarine and 11, 13 Rue de Seine. Sufficient attention has never been paid to the influence on the development of the theatre in England and France exerted by the places in which the stage was originally set up, and from which the theatre as we now know it has been slowly evolved. In England the theatre began in the open court of an inn and got itself a roof only in Shakspere's time. In France, it was put up inside a tennis court, and the effect of the oblong parallelogram may be detected in many French theatres to the present day. According to M. Vitu, the last theatre in Paris made out of a tennis court was the Théâtre Déjazet, which is still standing.

—The programmes have been arranged for the three Wagner concerts which will be given at the Metropolitan Opera House, under the direction of Mr. Theodore Thomas, on April 22, 24, 26. The soloists will be the three leading vocalists of the Vienna Imperial Opera—Frau Materna, Herr Winkelmann, Herr Scaria—who were chosen by Wagner to create the principal rôles in "Parsifal" at the Bayreuth festival, and who may therefore be considered the best living interpreters of the Wagnerian vocal art. Besides these Miss Emma Juch, Miss Emily Winant, Messrs. Theodore Toedt, Franz Remmertz, and others, will take part in the performances. The orchestra will be the Philharmonic, augmented to 150 musicians. The choruses will be sung by the New York Chorus Society and Liederkranz. The programmes contain the musical gems of Wagner's best operas and music dramas, and have been arranged with Mr. Thomas's usual skill and tact. *Brünnhilde* is Wagner's most perfect character, and Frau Materna the best interpreter of the rôle; and it is therefore of interest to note that those who attend the three concerts will become familiar with her whole career. In "Die Walküre" *Wotan* puts her to sleep and surrounds her with magic fire on the Rock of the Walkyries. Here *Siegfried* finds her in the drama following, and she becomes his wife; while in the last act of "Die Götterdämmerung" will be heard the wonderful music accompanying the self-immolation of *Brünnhilde*—a musical synopsis of the whole trilogy. At the first concert will be given the overture and Bacchanale, first three scenes, march and chorus of the second act of "Tannhäuser"; Ride of the Valkyries, *Wotan's* Farewell, Magic Fire Scene, from "Walküre"; Finale of Act III., "Siegfried" (the famous duo of *Brünnhilde* and *Siegfried*). At the second concert: Centennial March; Love Duo, from Act II. of "Tristan and Isolde"; "Die Meistersinger," the greater part of Act III., including prize song, choruses of guilds, quintet, etc. Third concert: overture, "Flying Dutchman," and Introduction, Ballad, spinning chorus, Act II., Vorspiel and *Pogner's* Address from "Die Meistersinger"; Act III. of Götterdämmerung complete (*Siegfried* and the Rhine-Maidens; *Siegfried's* narrative; Murder Scene and funeral music; *Brünnhilde's* Self-Immolation). Most of the selections from Götterdämmerung," "Walküre," "Siegfried," and "Tristran" will be heard for the first time in America.

—The public of Boston appears to be agitated and divided on the advisability of the purchase of Regnault's "Automédon" for their Museum. If the public of Boston don't know what it wants, it will wisely postpone the purchase of this particular picture until it does, and if then it decides to purchase it, all that one can say is, *de gustibus non disputandum*. The picture is not indecent, which is, we opine, the best thing that can be said of it, and might safely be seen by the picture-seeing people in Boston; and if those who supply the money see fit to give the price demanded, which we believe is $12,000, why, Boston can afford it, though it seems an exorbitant price for a second-class work of a second-rate painter. If sums like $12,000 are scarce in Boston (which we do not believe to be the case if a really noble object is to be served), it seems a poor use to make of one to buy the "Automédon." It is no disparagement to the cities of America to say that æsthetic education has been carried further in Boston and on sounder principles (and this we say even remembering that the South Kensington drawing-school system was once established there) than anywhere else in America; and if the Bostonians cannot settle this question without outside help, we feel no little diffidence in expressing an opinion, and certainly shall not pretend to advise. But as to the abstract question of the position of the painter of the "Automédon" we have no hesitation in adding our word to the discordant discussion. Regnault was an uncommonly clever painter, clever especially in that executive power which is entirely unrelated to great thought, and which indeed never appears in men of the grave and large type to which Millet and Delacroix belonged. It is a superficial excellence, which a truly great painter would carefully avoid, if he had the capacity for it, as likely to divert attention from the essential qualities of his art. In the "Alhambra Execution" this power was carried to such a point that it becomes phenomenal and worth placing in any collection, as is any supreme attainment in any vein of art; but it belongs distinctly to an inferior grade of art if we judge it even by the greatest modern work. And the "Automédon" is far from the best work of Regnault—it is an academical study, melodramatic in conception and extravagant in realization. Whoever compares it with Homer's ideal can hardly perceive the difference between Homer and Poe. This Automédon has struck an attitude which even the unquestionably excellent drawing and brilliant execution of the painter do not make other than theatrical. The horses are phantasms—Automédon, a tamer of nightmares. As a whole, the picture is an ostentatious exercise of executive ability which, in a young painter, may be condoned, but which Regnault even, had he lived to his artistic maturity, would have deprecated and probably destroyed. The heroic death (from the French point of view) and brilliant brief career of Regnault have given him an *éclat* in the art world of his day which we do not believe his works will maintain. To mistake him for a master, even in the modern schools, would be unfortunate, but to reject his really good work from a collection of modern pictures would be a still greater error. If the "Automédon" were really one of his best pictures, Boston would be fortunate to have it.

SCHLIEMANN'S TROJA.—I.

Troja: Results of the Latest Researches and Discoveries on the Site of Homer's Troy, and in the Heroic Tumuli and other Sites, made in the year 1882; and a Narrative of a Journey in the Troad in 1881. By Dr. Henry Schliemann, Hon. D. C. L., Oxon., etc. Preface by Professor A. H. Sayce. With 150 woodcuts, and 4 Maps and Plans. London: John Murray; New York: Harper & Brothers. 1884. Pp. xl.-434.

THIS volume gives us Dr. Schliemann's latest word about Troy. It is really a supplement to the author's larger work, 'Ilios,' published in 1880, and it resumes the descriptions and discussions where the earlier volume left them. Dr. Schliemann's work at Troy, as he reminds us, has already passed the period of ten years, "which has a fatal connection with the legend of the city," and it is now quite time to ask the decisive question, whether the new besieging army has really captured Troy, and can hold it against all attack from without. We propose here to pass by all lesser controversies, except so far as they affect the main issue; and to attempt to answer the real question which every reader of Homer is asking—What new evidence does Schliemann's work at Hissarlik in 1882 afford to justify his belief that he has found the city of Troy whose siege was the subject of the Iliad? As 'Troja' is a supplement to 'Ilios,' our review must be in many respects a supplement to our review of 'Ilios' in Nos. 815, 816 of the *Nation*. We there examined the evidence upon which "an historic existence" could be claimed for the Troy of Homer; and we came to the conclusion that, as the case then stood, Schliemann might fairly claim to have discovered a city which could be said to be the original of the Homeric Troy in the same sense in which the fortress in Argolis is said to represent the Homeric Mycenæ. We doubted, however, the sufficiency of the arguments by which he sought to prove that Troy never extended beyond the hill of Hissarlik.

The present writer visited Hissarlik in September, 1882, after Schliemann had finished his work there, but before the results of his last excavations had been published. It was difficult for one who had formed his ideas of the ruins from reading 'Ilios' to find his bearings within

the hill after the great changes which had been made during the preceding summer. These changes involved nothing less than removing the greater part of the remains of the third settlement, which in 'Ilios' is called the Homeric Troy, and uncovering the foundations of the second, which had now proved to be the only important prehistoric town on the hill. It was also perplexing that the great city walls of stone, which at once strike the visitor as the strongest proof of the identity of Troy, and the double gateway (which had become widely known as the "Scæan Gate" from being so called in 'Troy and its Remains'), all belonged to the second city, while this city was, according to 'Ilios,' only the predecessor of Troy. The double gateway itself, moreover, is not sufficiently imposing to have been the outer gate of a very powerful city; it is a great step from this to the Lion Gate of Mycenæ. But the saddest disappointment of all to those who visited Hissarlik under the influence of 'Ilios' was the "mansion of the Town Chief or King," a building about fifty-three feet long and twenty-three feet wide, whose lower walls (of which about four and a-half feet are now standing) were built of small stones and clay, like most house-walls in the modern villages of the Troad. This surely could not be the prosaic reality of which Priam's splendid palace, with polished corridors and fifty chambers of polished stone for Priam's fifty sons and their wives, is the poetic ideal! And the city of which this was the royal palace was confined to the little hill of Hissarlik, and was hardly large enough to house 3,000 inhabitants, even if the houses were six stories high ('Ilios,' p. 514; 'Troja,' p. 2). All these difficulties have been cleared up by the later excavations. Dr. Schliemann's reasons for his conclusions respecting the extent of ancient Troy, which seemed to us in 1881 to be an unnecessary and almost fatal obstacle to the acceptance of his great discoveries, are given in 'Ilios' (pp. 38, 514); the decisive proof seemed to be that he had sunk twenty shafts on the east, southeast, southwest, and west of Hissarlik in 1873, and had found no prehistoric pottery or house-walls, showing that the ancient city could not have extended beyond the hill. No one who reads Dr. Schliemann's argument on this point in 'Ilios' and his confession of error in 'Troja' (pp. 1, 2) can hereafter accuse him of stubbornness or unwillingness to be convinced of his mistakes. But no one who understands the true nature of the problem—certainly no one who has seen the confused mass of ancient ruins which fill the inside of the hill of Hissarlik—will deny that changes of opinion, even on such vital points as those just mentioned, are both justifiable and even creditable. The truth is, Dr. Schliemann has opened more serious questions than Science can answer in the next fifty years; and it is not a mark of wisdom to maintain fixed and exact doctrines about the details of these perplexing matters, or to expect them even of those most experienced in the discoveries themselves. He who makes the fewest positive statements about many of the points still in dispute will probably have the fewest mistakes to correct.

Dr. Schliemann was accompanied during his last campaign at Troy by two eminent German architects, Dr. William Dörpfeld, well known for his services at Olympia, and Mr. Joseph Höfler. Besides Dr. Schliemann's own account of his work in 1882, we have two letters of Dr. Dörpfeld, in the *Allgemeine Zeitung* for September 29, 1882, and March 30, 1883: the latter appears in English in the *Times* of March 22, 1883. These letters are valuable for their clear and concise statements of the results of the work at Hissarlik from an architect's point of view. We hope, indeed, that Dr. Dörpfeld has still much to say about Troy, and the world will hear it with interest.

We must here make a remark by way of caution, which may be needed by some who discuss the ruins of Hissarlik, but would suggest itself at once to every one who sees them. Many who talk of Schliemann's discoveries, and have a general idea of six or seven "cities" lying one upon another on Hissarlik, seem not to understand that there are great distinctions in the importance of the successive settlements. First, Dr. Schliemann, says of "the sixth or Lydian city": "All I am able to show of this city is its pottery; there is no wall of defence, nor even any house-walls which I could with any degree of probability attribute to it" ('Ilios,' p. 587). The other six settlements which Dr. Schliemann distinguishes have all left their ruins in separate strata upon the hill. Dr. Dörpfeld says (*Allgemeine Zeitung* of September 30, 1882): "All scholars who visited Hissarlik during the last excavations were convinced of the existence of the six distinct strata of ruins." But it must not be imagined that there is now any one place where six layers of ruins can be distinctly seen in a perpendicular line, at least by the untutored eye. The lowest stratum of all, resting on the native rock, 52½ feet below the later summit of the hill, contains ruins of a very ancient town, of which we have very little knowledge, as its remains are mostly covered by those of the second city, and cannot now be examined except where they appear at the bottom of the great central trench dug directly through the hill from north to south. Dr. Schliemann thinks "its length does not exceed 46 metres and its breadth can hardly have been greater," although he thinks it probably had a lower city on the plateau besides its buildings on the hill ('Troja,' pp. 29, 30). Of the second city we shall speak below. The third, fourth, and fifth settlements were, according to Dr. Dörpfeld, "little better than villages, containing only small dwelling-houses"; the third and fourth certainly never extended beyond the hill, and of the extent of the fifth our knowledge (as Dr. Dörpfeld says) is still imperfect. The topmost stratum belongs to the historic city of Ilion. This city was founded by Æolic Greeks at a very early period, probably before the seventh century B. C.; but it remained an insignificant town until it was enlarged by Lysimachus early in the third century B. C., who built for it a wall nearly five miles in circuit. It again fell into decay, was captured and burned by the Roman General Fimbria in 85 B. C., was soon rebuilt by Sulla, and was made into a large and flourishing city by the early Roman emperors. Dr. Dörpfeld, speaking as an architect, calls the upper stratum of ruins those of the "Roman Ilium," as the buildings there found *in situ*, so far as their age can be ascertained, all belong to the Roman period (*Times* of March 22, 1883). According to him, there are no remains of the Greek Ilion earlier than the Macedonian period (after Lysimachus) anywhere to be found *in situ* on Hissarlik; and it is impossible to determine the sites of the two temples of the Macedonian age, as their foundations have not been found, and only blocks from their upper parts remain.

We come now to the second settlement, which was large and strongly fortified and has marks of a rich and powerful city of great antiquity. Besides the historic Ilion, this great city is the only important town ever built upon Hissarlik; and it is but natural that these two should be the only cities on this site which have left their names in history or even tradition. One of the first results of the work of 1882 was the discovery that the second and not the third settlement was really the "Burnt City," to which belonged all the important prehistoric stone walls with their gates, which have always been considered parts of the second town, as well as all the treasures and most other articles of value which are assigned in 'Ilios' to the third town. The importance of this discovery was more and more apparent as the removal of the ruins of the third town brought those of the second into view. How, now, did so great a mistake occur? The error was not, as some have supposed, in ascribing the objects in question to the wrong stratum of ruins, but in ascribing the stratum of calcined bricks, on which the houses of the third town were built and in which most of the objects were found, to the third town rather than to the second. A slight inspection of the ruins makes this perfectly plain. The destruction of the second city was most thoroughly accomplished, first by fire and then by forcibly tearing down what remained of the buildings. Most of the large edifices on the acropolis were literally razed to their foundations, leaving just enough of their walls to show their plan. After this destruction the ruins of the city must have presented an irregular mass of rubbish, in which mounds here and there showed where a temple or other large building had stood. Three such mounds, all covering the ruins of one temple, are seen in Plan III. of 'Ilios,' marked H, being supposed to cover parts of the city wall. On this mass of burnt bricks and wood ashes, within which were buried the gold, silver, and pottery that belonged to the great city, the third settlers built their miserable houses, generally of clay and small stones, but sometimes of the material left by their predecessors. They made no attempt to level the heaps of ruins, or even the higher mounds, but built directly upon these, sinking their foundations into the rubbish below them. The broken and burnt bricks of the older city thus lay sometimes on a level with their floors and sometimes much higher. As the houses of the third town were apparently not destroyed by violence, they remained standing to a height of about six feet, and the whole presented the appearance of the ruins of a single town, of which the lower house-walls were standing, while the remains of the upper parts had fallen about them. It is this curious compound of the burnt bricks and ashes of the second town with the half-destroyed houses of the third, which figures as the "Third City" in 'Ilios.'

BOOKS ABOUT THE STAGE.

Henry Irving: A Biographical Sketch. By Austin Brereton. Scribner & Welford. 4to, pp. 136.

Henry Irving, Actor and Manager: a Criticism of a Critic's Criticism. By an Irvingite. George Routledge & Sons. 16mo, pp. 80.

La Comédie à la Cour: Les Théâtres de société royale pendant le siècle dernier. Par Adolphe Jullien. Paris: Firmin-Didot & Cie; New York: F. W. Christern. 4to, pp. 321.

Les Curiosités de l'Opéra. Par Th. de Lajarte. Paris: Calmann Lévy; New York: F. W. Christern. 8vo, pp. 251.

THERE can be no better evidence of the firm hold which Mr. Henry Irving has on the theatre-goers of the day than the appearance almost simultaneously of four books in which his career as an actor and as a manager is sketched and his art criticised. Two of these books appeared before Mr. Irving arrived in this country, and have already been considered in these columns. They form a curious contrast to the two now before us, as Mr. Brereton does well what the anonymous author of the American biography of Mr. Irving did very ill, and as the criticism of the Irvingite is avowedly an answer to the acute and admirable criticism of Mr. William Archer.

Mr. Brereton's biographical sketch is excellent within its simple and modest limits. It is a plain and straightforward account of Mr. Irving's career from his birth to his departure from England for America. We have pointed out before now the great inconveniences of writing the biography of a living celebrity, and certainly Mr. Brereton has been hampered by them, yet less than we had supposed possible. His qualified success seems owing to the rigid restraint which he wisely imposed on himself. There is no attempt at fine writing or at the higher criticism; indeed, there is very little original criticism of any kind. The facts are set forth succinctly and in order, and without digression. There is a useful and instructive list of the four hundred and twenty-eight parts acted by Mr. Irving during his first three years on the stage. It is to be regretted that a full list is not given of the hundred and sixty parts he acted after leaving Edinburgh in 1859, and before appearing in London in 1866. The list of the parts acted in London since the latter date is given in the appendix, which contains also an ample report of the dinner given to Mr. Irving in London on the 4th of July last, at which Lord Coleridge presided and Mr. Lowell made one of his most delightful speeches. Mr. Brereton has further provided an index of twenty-six columns, made with greater care than we are wont to see in British books. Almost the only error we have noted in the text is the assumption (p. 57) that Mr. Irving was the first to discard Colley Cibber's highly-effective perversion of "Richard III."—an honor which belongs of right to Mr. Edwin Booth. The book is adorned by seventeen full-page illustrations. The best is a photogravure after Mr. Long's portrait of Mr. Irving as *Hamlet*, and the worst is a hideous caricature of Mr. Irving as *Charles I.* The portrait as *Vanderdecken* is taken, without acknowledgment, from a striking drawing which appeared in the *Century Magazine*, and which is, in fact, doubly American, since the bold photograph from which it was drawn was the work of Colonel Van der Weyde. Mr. F. Barnard's sketches of *Digby Grant* (in the "Two Roses") and of *Shylock* are characteristic, which is more than can be said for his sketch of Miss Ellen Terry as *Portia*. A slip of the pen, by the way, in the list of illustrations (p. xi.) promises pictures of Miss Terry as *Digby Grant* and as *Benedict*.

It is said that John Wilkes declared that he was never a Wilkite. We incline to the belief that Mr. Henry Irving is not an Irvingite, and that he will scarcely thank the zealous friend who has rashly hurried to the assault of Mr. Archer. It seems to be an open secret in London that "An Irvingite" is Mr. Frank Marshall, the author of a comedy called "False Shame," and coeditor with Mr. Irving of Shakspere. Already he has thought best to circulate a printed apology for having ascribed to Mr. Archer the authorship of anonymous articles which he called "vile and scurrilous." It is, however, only fair to say that the most of "An Irvingite's" criticism of Mr. Archer is courteous. Like Mr. Brereton's book, his is calculated exclusively for the meridian of London—*e. g.*, it credits Mr. Irving with the death of Cibber's "Richard III.," and declares that *Hamlet* and *Iago* had never been acted naturally and colloquially until Mr. Irving attempted them.

There are two books for which the shelves of every dramatic library are yawning, and for the making of which the materials are abundant. One is a history of scene-painting, with an account of the evolution and development of the manifold devices of scenic illusion. The other is a history of private theatricals, of which M. Adolphe Jullien has now brought together three chapters in the sumptuous and stately volume on the 'Court Comedy of France in the Eighteenth Century.' The author is the musical critic of the Paris newspaper *Le Français*, and on musical matters he speaks as one having authority. He is, moreover, an investigator of wide erudition and inexhaustible patience, as his frequent monographs on the music and the musicians of the past have already proved, and as we have seen in his excellent 'Histoire du Costume au Théâtre.' The present volume is a new edition, greatly elaborated and thoroughly revised, of three separate studies, each published in limited editions and now out of print and scarce. One was on the performances given on the grand nights at Sceaux, when the Duchess of Maine was aspiring and conspiring. The second was devoted to the dramatic essays and exercises of Mme. de Pompadour on the stage of the "Theatre of the Little Cabinets." The third set forth the history of the theatre of the Trianon under Marie Antoinette. Taking the three together, we have a good view of three typical phases of the Regency and of the reigns of Louis XV. and XVI. The only other private theatre in France during the eighteenth century which has any claim to rivalry with these three is that of the Demoiselles Verrières, and of this M. Jullien has already been the historian in his delightful little book on 'La Comédie et la Galanterie au dix-huitième Siècle.' It was the Duchess of Maine who brought out at Sceaux the first *ballet d'action*, as distinguished from the preceding ballets, in which there was much singing, and which, indeed, were not unlike the *ballet-opéra* reinvented by Scribe. It was at Sceaux, too, that Voltaire brought out his comedy "La Prude," imitated from Wycherley's "Plain-Dealer," which in turn was a rough-and-ready version of Molière's "Misanthrope." It was at the theatre of the Château de Bellevue that Mme. de Pompadour sang and acted divinely in Rousseau's comic opera, "Le Devin du Village," after the performance of which the composer fled in confusion to avoid a presentation to the King. It was at the little theatre of the Trianon that Marie Antoinette, despite the repeated protests of Maria Theresa, persisted in acting even in the "Barber of Seville" of the iconoclastic Beaumarchais.

M. Jullien's book is illustrated with the lavishness and the skill we expect in all works published by MM. Firmin-Didot. There is a chromolithographic frontispiece representing a ceiling painted by Lebrun at Sceaux. There are etchings and photogravures and woodcuts in abundance, some of them being large folding plates. Add the graceful head and tail-pieces copied from contemporary decorative suggestions; an etching after Boucher, representing a ballet of Mme. de Pompadour's, and a heliogravure after Cochin, showing both the stage and the auditorium of Mme. de Pompadour's little theatre during a performance. Finally there is a most interesting photogravure of the Trianon theatre as it was in 1882. A portrait of Marie Antoinette after Bartolozzi has lost something in the transfer to wood.

M. de Lajarte is the second in command to M. Charles Nuitter in the care of the new library of the Paris Opéra, and the most entertaining and instructive of the half-dozen essays he has just put forth as 'Curiosités de l'Opéra' is his account of the inception and growth of this library, and of his own share in the rescue of the precious musical autographs, in which the Opéra was rich, but of which no one was taking any care. To M. Lajarte, also, we owe the accurate and exhaustive catalogue of the operatic scores now in this library. From the treasures of the library of the Opéra he has drawn the illustrations of his pleasant volume, most of which are facsimiles of musical autographs, of play-bills, or of title-pages. After the first essay and another on Spontini and his "Vestal" and "Fernando Cortez"—in the second of which was introduced a charge of Spanish cavalry represented by horses and men from Franconi's Circus—the most valuable paper is one on historic dances, in which M. Lajarte gives us an account of the dances of society and of the stage as they followed and borrowed from one another.

Coöperative Housekeeping. How Not to Do it, and How to Do it. A Study in Sociology. By Melusina Fay Peirce. Boston: J. R. Osgood & Co. 1884.

THIS scheme of reform in the social status of women seems to us at once too wide and too narrow: it promises to women the monopoly of certain functions which they will probably have some difficulty in usurping, while it would exclude them from all other fields of activity. In other words, Mrs. Peirce's project is vitiated by the arbitrary spirit which pervades opinion on the woman question, and which here, as so often, assumes the form of a lingering desire to confine woman's activity within the boundaries of domestic life, although Mrs. Peirce's conception of domestic life has little in common with the old ideal. We are, in fact, inclined to doubt—monstrous as such a doubt would seem to Mrs. Peirce—whether there be any essential connection between the housekeeping problem and the woman question. We are inclined to think that this "Study in Sociology" itself unconsciously points to a near future in which housekeeping will indeed be relegated to the domain of organized activities, but in which it will belong to women as much as any other work that they are willing and competent to do, and no more.

Mrs. Peirce regards the division of labor, as applied to the labor both of superiors and subordinates, both of mistress and maid, as the fundamental desideratum of housekeeping. She claims, and her claim will be generally endorsed, that no housekeeper should be required, or can be expected, to master the three arts of "cooking, laundering, and sewing" (how about the fourth art of "fighting dirt"?) so as to practise them or superintend their application without a vast waste of efficiency. In order, however, to perfect the division of labor, both of workers and superintendents, the domestic economy of several families must be centralized, each branch of domestic labor being superintended by one or more persons who devote their attention to it.

So far the public is rapidly becoming prepared to agree with Mrs. Peirce; but is the coöperation of housekeepers the only or the most probable mode of attaining a division of domestic labor? To answer this question, we must consider what is meant by coöperation. Now a coöperative society of the kind described by Mrs. Peirce is practically an unprofessional body of retail middlemen, engaged in the supply of their own wants only; that is to say, a body of persons occupied in other pursuits who, in addition to those pursuits, combine to supply certain articles for their own consumption, in order to save their pockets the middleman's profits. Thus, by "coöperative housekeeping," Mrs. Peirce understands the business of conducting what are already well known as "coöperative stores," and the additional business of performing the collective cooking and washing of the coöperators' families. From the very nature of the enterprise—*i. e.*, from the fact that the coöperators are not experts in what they undertake—it is essential that at first, until they have learnt their new business, the whole work of superintendence should be done by

members of the association, in order that their want of knowledge and experience may not be abused by hired managers and subordinates; and subsequently, as in all enterprises, much personal attention must be given to insure success. In coöperative societies, as in most other joint undertakings, the main stress of administration inevitably falls upon a limited number of individuals; but Mrs. Peirce seems to us to injure her cause in speaking of the labor of these officers as a "sacrifice," and of coöperative undertakings as "the business of supply conducted by the few for the good of all." If coöperative societies are conducted on business principles, "the few" should be compensated for their extra exertions, and their labors should no more be regarded as a "sacrifice" than the labor of the officers of any corporation or joint-stock company. And here we must stop to notice the vein of communistic sentimentality which pervades Mrs. Peirce's writings, and which, with her professed adherence to Mr. Henry George's philosophy, is likely to prejudice many persons against her really useful suggestions. She remarks (Appendix C, p. 179), "The first grand demand of every kind of successful coöperation is SELF-SACRIFICE. To coöperate successfully we must be actuated by that love for others which can 'smite the chord of self' and 'make it pass in music out of sight.'" Now, except this statement by Mrs. Peirce, which savors more of sentiment than science, we do not know of any evidence that the successful coöperative efforts to which she refers have had any other motive than enlightened self-interest; and indeed we doubt whether any successful enterprise involving large numbers of persons has ever been based on other incentives than self-interest in the ordinary sense, or else some species of "other-worldliness." We are therefore of opinion that, in estimating the probability that such a scheme of coöperation as Mrs. Peirce describes will commend itself to a certain class, it is only necessary to consider whether the class in question would deem the pecuniary profit a compensation for the effort involved.

When, then, the class in question is the wealthy class of American women resident in large cities, we believe that they would not consider the pecuniary gain any offset to the requisite training and exertion. The ordinary fatigue and worry to which a woman who can command trained service is liable in governing her own house, are trifling compared to the exigencies of administering a large "laundering" or catering establishment. The majority of American women of the wealthy class are at present totally unfitted by their education and habits for such heavy responsibilities as Mrs. Peirce would impose upon them; and long before women of this class are likely to be prepared for wider functions, we fear that remorseless Man (who has already, as Mrs. Peirce mournfully records, usurped the spinning and weaving, "the making of women's and children's dresses and underwear, the laundering of shirts, collars, and cuffs, the canning of fruits and vegetables, the preparing of soups and pressed meats, together with twenty such trifles as the roasting and grinding of coffee, the mixing of indigo with water for the bluing purposes of the laundry, etc.") will also seize the profits to be made by relieving the rich of the remaining details of domestic industry.

Unsuitable, however, as Mrs. Peirce's scheme is to the wealthy class of American women, it may well be extremely useful to the less affluent classes—to all classes, in fact, which combine with small means general intelligence and education, as well as practical skill in the domestic avocations. Especially to the dwellers in country towns, we can imagine that "coöperative housekeeping" would be a boon. To women in these circumstances, it would probably offer a positive decrease of fatigue, combined with pecuniary gain. To women of the agricultural class, coöperation can scarcely offer succor in the present sparsely-populated condition of the country. They have more to hope from the progress of mechanical invention, and, let us add, from improved physical habits. The practice of adequately ventilating dwelling-houses during the cold season, and of eating wholesome food, would go far toward saving the farmer's wife from fainting at her work.

To sum up the relation of "coöperative housekeeping" to the woman question, we should say that instead of being, as Mrs. Peirce would claim, a panacea for all the ills of woman's present lot, it is, at the most, a specific. The thought, however, which underlies the special scheme, is that which must eventually work the regeneration of the sex—we mean the organization of female industry in its fullest development by women. It is scarcely possible to estimate the effect upon the social status of women in general which might be exerted by a class of women comparable in many-sided intelligence and power to the class of men who rule the thought and industry of men; but such a class of women can only be created by equal opportunities of education.

It is to be regretted that Mrs. Peirce should not have entered more into detail with regard to her system of housekeeping apart from the woman question. She does not, for instance, consider the difficulties of serving meals hot from a common kitchen to scattered dwellings; and yet in large towns this would seem a very serious difficulty, since in large communities neighborhood has little to do with mutual acquaintance or with similarity of tastes and circumstances; while such associations as Mrs. Peirce recommends would more probably be formed, at least in the first instance, by persons between whom there was some social bond than between those whose only connection was local proximity. Again, with regard to the daily cleaning of houses, Mrs. Peirce's suggestions are confined to the case of a young married couple, for whom "a single neat-handed Phyllis could suffice to do up the dainty rooms." But how would it be when the family had expanded to eight or ten persons, and the "dainty rooms" of the young couple had become a "mansion"? Perhaps the collective housekeeping, if we may so term it, of the future will necessitate a different mode of building—an expansion of the apartment-house or hotel-cottage scheme, or perhaps rather of the plan of English college buildings; resulting in the erection of blocks or groups of dwelling-houses around central domestic offices with a common staff of servants. After all has been said, however, as to labor-saving devices, we fear that Americans will always be overburdened by the practical cares of life so long as the released energy seeks merely some fresh channel of material luxury and the "deceitfulness" of added riches.

Sepulture: Its History, Methods, and Sanitary Requisites. By Stephen Wickes, A.M., M.D. Philadelphia: P. Blakiston, Son & Co.

THOSE in whom sentiment is warm are differently affected by the thought of death, especially the death of friends. To some minds the cemetery is in fact what it is in name: the dear one is "put to bed," reposes, sleeps. "Here rests," "Here lies," "*Requiescat*," often literally expresses the idea which for months and years leads the survivor to the place thus made sacred, as to a shrine; in his forlorner and more troubled moments, to long for the time when he can be laid by the side of the beloved object; and, meanwhile, to decorate, to lavish wealth and taste upon, the spot. But there are others, in whom sentiment is quite as strong, who shrink from the thought of a grave as from far more than death. To such it is not death, it is burial, it is exposure—alone, in the weather—that is so full of dread, for themselves as well as for those whom they loved. To others still, burial and the grave mean chiefly loathsome decay. To these three classes burial is of deep and enduring interest, and yet they rarely discuss it. It is too near to their hearts for ink and paper—too near, indeed, for common speech.

The sanitarian approaches the subject from another direction. He would let the dead bury their dead, only so far as they may not harm the living; and this harm, in one way or another, may happen whenever the two are in company. It is astonishing how death spreads death. The harvest of disease begins not only to be sown, but almost to ripen, as soon as the breath leaves the body. The specific contagion of special disease does not perish with the primary victim, but one may fancy it to envelop the body as a cloud, so baleful are some corpses while yet awaiting burial. With decomposition all bodies become noxious, and necessity, modified by sentiment, has controlled the disposition of the human dead from before the dawn of history. Caves, the soil, catacombs, and flames have been the principal means of preserving the living from the dead. The Egyptian embalmers undertook to secure a perfect and harmless receptacle that the wandering soul might reënter; but the earth and fire have been the most ordinary transmuting agents intentionally employed. A sparse population would naturally bury, and a crowded one would burn; but to the latter course there are remarkable exceptions, notably in China. That singular bundle of conservatism takes into its bosom the remains of even its non-resident sons; and, curiously, the affectionate reverence bestowed upon its multitudinous graves is a powerful obstacle to the introduction of modern ideas. It is sacrilege to remove the ancestral tombs, and railroad surveys find them blocking every line.

Burial in church and churchyard had its origin in the belief that proximity to the altar, or to the holy man resting near, would benefit the sinner. But there is no such catalytic action, and the sinner continues his career of mischief, and, dead, poisons air and water, as, living, he polluted the moral springs. What is left of the saint after death is even more pernicious, for his slow decay and exhalation go on under the very feet of the worshippers. It is doubtless what may be called the mechanical theory of the resurrection that is responsible for much disease in Christian lands. Forgetting that there are celestial bodies and bodies terrestrial, there has been an almost universal effort to commit the physical frame to the earth in the unacknowledged but cherished belief that corruption will inherit incorruption. The alternative reading in Job, "out of my flesh," is forgotten, and upon the text "in my flesh shall I see God" many build an article of faith. Numerous epitaphs make it plain that the subjacent corpse expects to rise in its proper form from that spot at a day of judgment; and growing out of this sentiment is the unconscious feeling that another disposition of the dead is tampering with immortality. Devout people who are sensible have no fear that accidental death by flame or flood creates a flaw in their title to eternal life; but the superstitious shrink from voluntarily transmuting into ash the combustible frame. And yet only fire or chemical action completely solves a problem that affects both health and

sentiment. In the one direction burial fills the soil with the ordinary hurtful products of animal decay, and frequently with the special seeds of virulent diseases, which, in defiance of time and frost, lie in wait year after year to reproduce the fatal crop. In the other, the fervent heat of the furnace, clean and potent, speedily volatilizes the tenantless body into invisible and harmless gases. But the way to the best is travelled slowly, and the public advances with faltering steps. Meanwhile, fortunately, suburban cemeteries are generally substituted for the intramural burial places of earlier years. But, in our villages, graves and dwellings have a too frequent proximity, and many a well is charged with solutions of animal débris, while the air above the misnamed God's Acre and the soil itself are poisoned. On the Continent in many burial grounds there is no pretence that the body will remain in either solitary or perpetual occupancy of a grave. Such resting-places are but partial and temporary. Other tenants invade them, and time, instead of strengthening the possessory rights, weakens the claim, until finally a rude eviction into an uncertain limbo is all that is sure. From such a certain uncertainty cremation is a definite and plenary relief. It is the modern realization of the old Hebrew vision, in which the ecstatic prophet exclaimed, "My father, my father, the chariot of Israel and the horsemen thereof!" By fire, indeed, does corruption put on incorruption.

The book that has brought out these remarks leads up to but stops short of advocating the furnace. Written with the laudable and public-spirited motive of warning against the dangers of interment, it presents in a desultory way many historical facts, and fairly depicts the evils to the living from the burial of the dead, but inconsequentially concludes that an innovation upon the traditional sentiments of the people is not now demanded, whatever may be required in the future. But its very last paragraph is the foot-note: "In Modena, Italy, excavations made through a part of the city where the victims of the plague were buried three hundred years before, caused an immediate outbreak of the disease in the neighborhood." Are we, to whom yellow fever and cholera are not strangers, to say nothing of typhoid and scarlet fevers, and others that are always with us—are we to await the plague before we purify instead of poisoning our surroundings? On another side this work has been written so as to leave, unfortunately, the impression of feebleness or of inexactness in many parts. It opens with a speculation upon the burial of Abel's body by Cain (if he did bury him), and other Biblical history is used freely and devoutly, but not always with proper care. For instance, the author speaks (p. 16) of Saul as buried under trees, and two pages later cites his as a body that was burned (misprinted "buried"). Saul's case, in fact, is a multiple example. After his suicide his enemies first fastened his decapitated body to the wall of Beth-shan; his friends took it thence, and, having burned it (whether in honor or for security does not appear), interred it under a tree at Jabesh; and ultimately it was laid in the sepulchre of his father, Kish, at Zelah. In describing the Towers of Silence, our author quotes Monier Williams as writing from Calcutta so as to imply that this peculiar cemetery is near that city. Really, as the final paragraph (three pages later) shows, it is at Bombay, where the Parsee population of India centres. The prototype of these towers is used by the Guebres, near Ispahan. Again, referring to the law of the twelve tables, Dr. Wickes explains that the enacting Decemviri flourished "A.D. about 200." But the real date is A.U.C. 300, or B.C. 450.

Aboriginal American Authors and their Productions; especially those in the native languages. By Daniel G. Brinton, A.M., M.D., etc. Philadelphia, 1883. 8vo, pp. 63.

In the body of this little volume, Mr. Brinton has given us a partial list of aboriginal American authors, together with a brief summary of what they have accomplished in the several walks of literature. In its original shape, it was prepared and submitted to the Congrès des Américanistes, at the meeting held last summer in Copenhagen, for the purpose of calling attention to the existence of "a number of relics of aboriginal American literature," and of bespeaking "the aid and influence of that learned body in the preservation and publication of these rare documents." Since then the work has been entirely rewritten, and in giving it to the public in the form in which it now appears, Mr. Brinton not only makes it the occasion of renewing his appeal for the perpetuation of these records, but he seems also to have intended it as a proof of "the existence of the literary faculty in the native mind."

Of the importance of preserving these documents there cannot, we imagine, be much doubt, and so far as this little volume is designed to serve that end it is well-timed and has our hearty approval; but when we are asked to go further, and regard it in the light of an argument, soberly and seriously made for the purpose of demonstrating the Indian's capacity for "literary culture," we begin to hesitate. As well might we be expected to listen patiently to a refutation of Parson Jasper's theory that "the sun do move." As a matter of fact, the proposition is undeniable and needs no proof. A hundred years or so ago, when the Indian was regarded, by saint and sinner alike, as anything but a man and a brother, things were very different, and an argument of this character then would have had its uses; but to-day, with Indian schools and newspapers flourishing among us, it is an anachronism, and, so far as we know, is not warranted by anything that has been recently said by any advocate of evolution whose opinion is worth the paper on which it is printed. But even if this were not the case, and a discussion of this subject were still possible, a question might arise as to the soundness of that portion of the argument which classes a writer like Garcilaso de la Vega among the aborigines. So far from being an Indian, he was, as is well known, of mixed (Spanish and Indian) blood, was educated a Catholic, passed the most of his life in Spain, and his works are written in that language; and to speak of him as an aboriginal author, or as proving the Indian's capacity for literary work, is to extend the system of classification beyond all legitimate bounds. Carried one or two steps further, it would make an Indian of John Randolph of Roanoke.

In speaking of "the literary efforts of the aborigines of this continent" as furnishing the material for "a chapter in the general history of literature hitherto wholly neglected," our author is not as clear as might be wished. If he means to say that these efforts, taken as a whole, have never been treated as forming, by and of themselves, a literature, using that word in the sense that we do when we speak of English or French literature, he is probably correct. At all events, except the history of Maya literature referred to on page 30, we do not know of any work in which they have been so considered; neither do we see any urgent necessity for treating them in this manner. But if our author intends us to understand, as the language would seem to imply, that these works, or a majority of them, as well those written in a native as in a foreign tongue, were unknown or unused, or that many of them have not been discussed and described much as they are in this volume, then he is very wide of the mark, as must be apparent to any one who will examine the book itself. Literally speaking, there is scarcely a page that is not full of references to writers who have treated this subject in some shape. To say nothing of bibliographers like Field, or historians like Hubert H. Bancroft, who certainly record the names of many of the native writers mentioned by Mr. Brinton and indicate the character of their works, we must not forget that Bandelier has delved in the same field, and that, a century or more ago, Clavigero covered more or less of the same ground, and, all things considered, did it well.

Aside from these imperfections, which are not necessarily connected with the subject-matter of the volume, and may be passed over without marring its harmony, we have none but words of commendation for this little book. It is not exhaustive and does not profess to be, but it is sufficiently complete to satisfy the demands of the average student. It is, withal, well arranged and so thoroughly indexed as to make a reference to these forgotten worthies and their works comparatively an easy matter. If to this we add that its real purport is to enlist the aid of "scholarly men, of learned societies, of enlightened governments, of liberal institutions and individuals, not only in our own country but throughout the world," in the preservation and publication of these records, enough will have been said to show our appreciation of the work and our sympathy with its object. As an act of justice to Mr. Brinton—and we make the acknowledgment with pleasure—it must be said that, of all our American scholars, he is the one from whom this appeal comes with the best grace. When made by him we know that it is not the perfunctory statement of a platitude, but that it is the earnest cry of one who understands the importance of the object for which he strives, and who has repeatedly given proofs of devotion to the cause for which he pleads. In the publications which, from time to time, he has made, and is still making, in the "Library of Aboriginal American Literature," he has not only ventured into an unusual field of literary activity, but he has set an example of scholarship and, we may add, of enlightened liberality which, it is to be hoped, will not lack followers.

Fine Arts.

THE WATER-COLOR EXHIBITION.—II.

THERE are in the exhibition of the Water-Color Society a few drawings which it is impossible to classify and not easy to characterize. The chief of these is the life-size drawing by Weir, "Sunday Morning," a half-length female figure in a peasant's Sunday costume, apparently just setting out for church. While not free from *pose plastique*, it is largely drawn, and, while qualified as an "illustration," is more ambitious in size and treatment than as an illustration it need be, but not so thorough as its scale demands. It is hardly an excuse for the flimsiness of the background that it was intended for an illustration, since a drawing the size of an octavo page would answer every purpose and enable us to overlook many technical defects. This negligence on a large scale is a greater fault than when *in minimis*, as the only reason for painting a gallery picture, and especially a water-color, large, is the desire to get more ideas or finer expression of them than is possible on a small scale. There is a popular misapprehension and misestimation of small works of art like those of Meissonier, based on the erroneous notion that this minute painting means refinement of delineation, greater delicacy of execution, or finer sense of truth. The fact is, that if we should reduce any first-rate portrait by Titian or Raphael, perhaps even Velasquez, to the small size of a Meissonier, we should see that the great masters had a finer perception of the value of detail than Meissonier, and had given more of it. To attain such minuteness of execution as his is not an artistic quality but a physical one, and the true standard compels an idea to be valued not by its scale of representation but by its intellectual and artistic quality. Both the ambition to paint smaller, and that to paint larger, than the full and facile expression of the idea requires, are equally affectations and executive vanities, of which, however, that to paint large is the more pardonable, as the success implies a broader and better artistic training. This alone stands Mr. Weir in stead, for his large figure might just as well have been put on a board of 8x10 inches. It is able; but the affectation of negligence as to method (*vide* the girl's collar rubbed through and making a hole in the drawing, with false shadow) is a weakness. Mr. Weir's position and talents ought to make him avoid all such examples of affectation of manner. It is well to know that he can do work on such a scale, but he might have learned at the same time that large thoughts are requisite for large forms.

Mr. Millet's "Cymbal Player" is in an excellent vein of art, and is marked by a genuine mastery over action, which is one of the most valuable qualities in figure painting. To catch a fleeting action is as much rarer a gift than the simple posing of one well and gracefully, as shooting on the wing is more difficult than shooting at a target, and is a quality *sine qua non* in the highest range of design.

There are two good water-color studies of the orthodox style by Walter Paris, the "Church of St. Laurent" and "A Bit of Sussex." A naïve and really clever, though not in any commensurate degree effective, drawing is "Mommy and Her Old Man," by Alfred Kappes. There is nothing conventional, nothing borrowed even, in quality or treatment in this bit of negro life, which is humble and rustic without being vulgar; and realistic, as such a subject demands, without any pretension or exaggeration. The essential element, the character of the two negroes, is well given, and if there is a little crudity in the make-up we may well pardon it in the face of so much sincerity.

Two drawings by Charles E. Dana, "St. Malo, Brittany," and "Study from Nature, near Lenox, Mass.," are notably good work. So is the large drawing by Walter Satterlee, "Two Sides of a Convent Wall," a monk with his breviary in the shadow of convent wall, looking out with a tinge of melancholy, thinking, doubtless, "what might have been" as he sees two lovers playing with the grapes that hang in the sun on the other side. The literary idea which is the basis of this work is better put into artistic form than is generally the case with such fancies, but Mr. Satterlee has gone to his present limit of work with such evident ease that we cannot refrain from asking him why he did not go further, not merely in realization of fact, but, which is far more important and worthy study, in the realization of the color his drawing only gives a suggestion of. An excellent "Study of Trees" by Mr. Sonntag, No. 50, is more thorough than some of that painter's work we have seen lately. Mr. Fredericks's fantastic and weird Rip Van Winkle is, as design, original and imaginative and makes its mark, but as painting it depends too much on methods which cannot render the best qualities of water-color, to be fairly put in comparison with works in which color is chief. On the contrary, a drawing by Mr. Seymour, "The Sunset Gun," shows an extraordinary sense of color, borrowing somewhat from Turner's laboratory, keeping the tints pure and well contrasted as colors, but showing a most un-Turnerian want of valuation of light and shade. The sea which reflects the sunset sky would be one broad blaze of the reflection of such a conflagration, while the painter has broken it up into petty wave forms on which the sky has exerted no influence to correspond with its character.

The Society for Political Education.

(ORGANIZED 1880.)

Executive Committee, { DAVID A. WELLS, GEORGE S COE, HORACE WHITE.

OBJECTS.—The SOCIETY was organized by citizens who believe that the success of our Government depends on the active political influence of educated intelligence, and that parties are means, not ends. It is entirely non-partisan in its organization, and is not to be used for any other purpose than the awakening of an intelligent interest in government methods and purposes, tending to restrain the abuse of parties and to promote party morality.

MEMBERSHIP.—ACTIVE MEMBERS are such persons as will pledge themselves to read the Constitution of the United States, and that of the State in which they reside; who will agree to read at least one of the annual courses as included in the *Library of Political Education*, and who will pay an annual fee of 50 cents (which may be forwarded in postage stamps), entitling the member to receive the tracts and lists published by the Society during the year. CO-OPERATING MEMBERS, $5.00 or more, which shall entitle such member to receive the tracts and lists published by the Society, to nominate two Fellowship Members, pay annually, and to take part in the control of the Society.

PUBLICATIONS.—*The Library of Political Education*, First Series, 4 vols., $3.00; Second Series, 3 vols., $5.00; Third Series, 4 vols., $3.00 (being a reduction of about 20 per cent. from the published prices of the separate volumes). The Economic Tracts, First, Second, and Third Series, twelve numbers, price per series 50 cts.

Full prospectus of the Society, with titles of publications, sent on application by the Secretary,

INDOORS AND OUTDOORS.

A monthly journal issued by the NATIONAL ASSOCIATION FOR SANITARY AND RURAL IMPROVEMENT, has just entered upon its second volume. Its editors are Charles F. Wingate, Sanitary Engineer; Samuel Parsons, jr., and Jno. Y. Culyer, Landscape Architects.

It aims to give simple, practical information to all desiring healthful and beautiful homes; in short, to tell the average householder with a small piece of ground how to ornament the latter at a moderate cost; how to arrange fences, hedges, vines, flowers, trees, walks, lawns, and to show how plumbing may be made safe, drains and cesspools constructed, and to advise about warming, lighting, and ventilation.

Send for sample copy. Subscription price 50 cents.

Editorially commended by Geo. W. Curtis in *Harper's Weekly*, N. Y. *Sun*, the *Nation*, and the *Country Gentleman*.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 28, 1884.

The Week.

BOTH National Conventions are to be held in Chicago this year. In imitating the Republicans in selecting that city, the Democratic Committee is said to have been animated by various and conflicting motives. The contest was between Chicago and St. Louis. Much pressure was brought against the latter city by nervous Democrats who were sure that, if the Convention were held there, the delegates would be stampeded for the old ticket of Tilden and Hendricks because it was originally nominated there. There are Democrats, however, who do not believe that the Tilden peril has been averted by going to Chicago. The *Sun's* quondam candidate, Mr. Holman, is of the opinion that the old ticket is the strongest which the party can select, and that it would be certain of success at the polls. He expects to see a majority of the delegates arrive in Chicago animated by the same belief, and predicts that Tilden will get the nomination if he will accept it. Other authorities believe that Tilden will at the last moment turn over his following to some other man; but who this will be, no one of them is able to predict. The situation is strikingly like that of four years ago. Then Mr. Tilden was so unsuccessful in his efforts to convince his most intimate friends that he was really not a candidate, that nobody knew when the Convention met whether he wished a nomination or not. All were agreed, however, that he could name the candidate if he would, but though he wrote a letter which half the Convention took for a declination, and the other half could not understand, he gave no indication of his preference for any other candidate, and the Convention was obliged to proceed without his advice.

In 1880 both Conventions met in June, the Republican on the 2d and the Democratic on the 22d. This year the Republicans will come together on June 3 and the Democrats on July 8. Probably the latter have made their date later than usual in order to profit by any light which the action of the Republican Convention may throw upon the situation. This is the natural conduct of a party which has no principles of its own that it dares to avow, and which, in the language of its Committee's call, is openly in favor of nothing more specific than "pure, economical, and constitutional government." The first convention of the year will be that of the Greenback party in Indianapolis on May 28, and at this it is barely possible that General Butler may be nominated, although he is perceptibly much weaker as a candidate than he was a few months ago. There are many cheering evidences that his defeat in Massachusetts was even a more serious personal disaster than it appeared to be at the time.

Reports from the Southern States indicate that the delegates from that section to the National Republican Convention will be made up in the usual manner. They will be composed entirely of Federal office-holders and of negroes who will do as the office-holders tell them to. The Louisiana delegation will be headed by Senator Kellogg and Pinchback, and will be solid for Arthur, with Logan for second choice. Most of the other Southern delegations will be of the same disposition. The Southern delegates, in fact, occupy the same position in a national Republican convention as the Southern Democratic vote does in the Electoral College. Both are "solid," and one is about as much of an evil as the other. President Arthur's strength in the Convention will be made up mainly of this solid Southern contingency, which will not be able to give a single electoral vote for the Republican Presidential candidate. It will represent merely the Custom-houses, Post-offices, and other Government positions in the South, and will be as thoroughly mercenary a brigade as it would be possible to get together anywhere.

Those who are trying to make light of the recent conferences of the Independents in this city and in Brooklyn because similar movements came to nothing in 1872 and in 1876, would do well to remember that there have been a great many changes in the political world since then, and that it is not the Independents who have suffered by them, in this State at least. Nothing seemed less likely in either of those years than that an Administration candidate for the Governorship could be defeated in New York by a majority of 192,000, or than that Civil-Service Reform Acts could be passed both in Congress and in the State Legislature, or than that Mr. Chester A. Arthur would be found commending such laws, and at least pretending to execute them, or than that his organs would be found defending his Custom-house appointments on the ground that they were in the line of civil-service reform, or than that Mr. Conkling and Mr. Tom Platt and Mr. John F. Smyth would have retired from politics on the simple ground of failure and unpracticalness. The situation is, in fact, almost a wholly new one. It seems, moreover, almost providential that it should be acknowledged on all hands that the next Presidential election must be decided by the vote of the State in which the Independents are most powerful. They have not, in other words, to go searching for the Mikes, and Jakes, and Barneys all over the Union in order to tackle them. They have got them just where they want them, and where they can dispose of them with least cost and trouble.

Mr. Blaine has apparently been completely misunderstood again by a well-meaning but blundering friend. Congressman Bayne, of Pennsylvania, called upon the historian in his study a few evenings ago, and found him looking "remarkably well," his "bright eye, clear, strong voice, and vigorous activity in his arduous daily work, proclaiming him every inch the man he ever was." Mr. Bayne had a delightful chat, heard all about the "history," and the pleasure which its author was taking in writing it, and then, in a most unaccountable manner, had no sooner got out of the house than he began to nominate Mr. Blaine for the Presidency. An impartial and unsophisticated person, listening to Mr. Bayne's energetic talk, would suppose that the conversation which had taken place in the study was not on history at all, but on the best way of starting a Blaine boom. Mr. Bayne announced with the air of absolute authority that while Mr. Blaine is not a candidate, there is not the slightest danger of his declining the nomination if it is offered; that he is the only man who can be certain of making Maine "safe" in September; that he is certain to carry New York; that Pennsylvania is wild for him; that nobody anywhere is against him; that the people have twice been cheated in their desire to have him nominated, and that he is certain to be nominated now because he is unquestionably the choice of the masses of the party in all the States. It is very clear that Washington is not a favorable place for a retired statesman to engage in historical composition. His privacy is constantly invaded not only by annoying rumors and canvasses, but by officious friends who are unable to perceive the difference between a great history and an ordinary campaign document.

No change is to be noted in general trade during the past week. Some slackening, due to the Western floods and the extremely bad weather, was to be expected; but this is of course a temporary and accidental check. There is good reason to anticipate that when the weather improves we shall see greater activity in the movement of merchandise than has been felt during the past six or eight months. Wall Street speculation is still under the control of the large operators, who have marked up and marked down prices to suit themselves. The coal carriers (and especially Delaware, Lackawanna and Western) show a considerable advance. The remainder of the list, with the exception of Pullman Palace Car and Oregon Navigation, shows a small decline. The most important event of the week has been the advance of sterling exchange to a point where gold shipments have become necessary. The movement of specie has been small thus far, but it may assume very considerable proportions. This seems to be apprehended by the Secretary of the Treasury, who caused a verbal inquiry to be addressed to the Clearing-House Association, the purport of which was that, inasmuch as the Government's gold balance might be drawn down to a dangerous point, it would be well to know how the Clearing-House would regard the employment of silver dollars in the settlement of its (the Government's) balances. The answer of the Clearing-House Committee (according to the *Financial Chronicle*) was that they must first receive the thirty days' notice of intention to pay silver, as stipulated when the Sub-Treasury became a member of the Association. As this matter involves the question of a change in the

standard of value, its settlement is looked forward to with the deepest interest. There is, however, no cause for immediate alarm, since Congress may at any time put an end to the crisis by suspending the coinage of silver.

It appears to be agreed among our morning newpapers that there has been no official communication between the Treasury and the Clearing-House on the subject of silver payments, but that everybody should act as though there had been. How people will act if the thirty days' notice is given by the Government of its intention to pay in silver—or *when* it is given, for it is only a question of time—can be easily foreseen. Everybody who has any money will want to get it into such shape that it will remain at par with gold regardless of the action of the Government or of the banks or of both combined. This can be done by drawing gold or gold certificates, and locking them up in the safe-deposit companies, or by buying sterling exchange or gold-bearing bonds. Already a discrimination has been noticed among investors in favor of securities specifically payable in gold. The fact that depositors will look out for their own interests when the time comes, will prevent the banks from accepting silver, however much they may be inclined to do so. They can within thirty days possess themselves of every dollar of gold which the Government holds, and no silver man can object to their doing so; and with this stock in reserve they can probably maintain gold payments so far as they and their customers are concerned. The suggestion has been made that the Treasury need not give the thirty days' notice which Secretary Sherman agreed to when the present arrangement with the Clearing-House was made The agreement having been made (and made at the instance of the Government), a violation of it would be an act of repudiation and perfidy which, it may fairly be presumed, neither Secretary Folger nor any successor of his in office would ever be guilty of.

The telegraphic synopsis of Senator McPherson's bill to suspend the coinage of silver dollars till January 1, 1886, and to make gold and silver bullion legal tender, differed in an important particular from the text of the bill, which provides that silver bullion shall be legal tender only at its value as compared with gold. In other words, both gold and silver bullion are to be legal tender for what they are actually worth. This is unobjectionable in principle, although the practical operation of the bill would be attended with difficulties arising from the fluctuations of silver. If Mr. McPherson's bill in any sense represents the present attitude of the Democratic party in Congress as to silver, it gives a more hopeful view than we have ventured to entertain. At all events it will serve to bring on a discussion of the silver question, than which nothing is more desirable at this time.

The Copyright Bill is very nearly reached in the House, and the enemies of the measure intend when it comes up to move an amendment requiring manufacture in this country. We learn from Washington that its friends are very confident that it will pass as it comes from the Committee. The "protectionists" are evidently very much afraid to come out against it. In ordinary cases they can insist on fostering American manufactures without allying themselves with people who openly advocate direct robbery of the producer. They therefore attempt to gain the friendship and vote of the pirates by advocating the bill in public, and privately declaring their intention to kill it by a "long fight."

We are requested by the Copyright League to state that, until the Dorsheimer bill is either passed or defeated, it will be represented at Washington by Mr. James Lowndes, of that city. Mr. Lowndes's standing as a lawyer in Washington is well known, and his instructions are that the League, which now has the support of five hundred names, desires the passage of a simple authors' copyright bill, which will give English and American authors exactly the same rights everywhere that they now have at home, free from any limitations or restrictions as to the place of manufacture, whether proposed in the interest of publishers, paper manufacturers, or pirates. The Dorsheimer bill was framed with exactly this intention, but as critics, friendly or hostile, have found flaws in its phraseology, the League is especially desirous that every one who thinks it worth while should forward to Mr. Lowndes, or to it, any suggestions with regard to the form of the measure, and promises that they shall receive due consideration. The enemies of the bill are endeavoring to defeat it by delay, the only vote thus far taken in the House having shown a majority of fifty-seven in favor of the measure.

Mr. Belford, of Colorado, is a terrible but illogical fellow. He made a ferocious attack on the West Point Academy last week, because it does not admit very ignorant boys, and exclaimed with what he thought was destructive force: "What in God's name has grammar to do with fighting battles?" He has since then had a quarrel with Mr. Cobb, the Chairman of the Public Lands Committee, of which he (Mr. Belford) is a member, in the course of which Mr. Cobb expressed a desire to have "the gentleman from Colorado shut his jaw, or he would shut it for him." To this "indecent remark" Mr. Belford makes answer that he "will not allow any man to bulldoze him, and especially a man who would spell Rhode Island with a little *r* and leave out the *h*." He further adds "that he is prepared for Cobb now, and that if he ever attempts to shut his jaw for him, the Committee on Public Lands will require a new Chairman." But, we ask, what in thunder has spelling to do with shutting jaws? Why should Mr. Belford allow a man who spells Rhode Island correctly to shut his jaw for him any more readily than a man who begins with a small *r* and leaves out the *h*? Is not this a disgusting concession to the claims of knowledge? When a man feels in this way about spelling, what security can we have that he will not soon truckle to grammar or even arithmetic? Our rule would be to allow no man, however gifted or accomplished, to shut our jaw for us.

The text of Prince Bismarck's despatch returning the Ochiltree resolution has been published. It is more dignified in tone than we were led to expect, and has also more reason in it. What he objects to is, it appears, the passage which asserts that Herr Lasker's "firm and constant exposition of and devotion to free and liberal ideas had materially advanced the social, political, and economical condition" of the German people. We presume Herr Lasker's friends would maintain that this was strictly true, but then, as he passed his parliamentary career in opposition to Prince Bismarck's policy on domestic questions, it is perhaps hard to expect Bismarck to admit it, on the motion of a foreign Legislature, and it would be very unlike him to accept meekly the implied rebuke which it contains. Nevertheless, a larger-minded and better-tempered man would have let it pass in a eulogy, from whatever quarter, on an opponent whose lips were forever sealed. Prince Bismarck's right to withhold the resolution from the Reichstag is a question which we must leave to German publicists. On one point, we confess, the Chancellor has clearly the best of the controversy. He says with much modesty:

"I should not venture to oppose my judgment to the opinion of such an illustrious body as the House of Representatives if I had not, by more than thirty years' active participation in the internal policy of Germany, gained an experience which justified me in attaching a certain value to my judgment in questions of home affairs."

It is undoubtedly true that he knows more about the domestic affairs of the German Empire than our House of Representatives. Over Colonel Tom Ochiltree, who really got up the resolution and procured its passage, his advantage in this respect is simply beyond computation.

The petition for the impeachment of Judge Locke, of Florida, throws a new light on an old subject—the connection between the character of judges and their salaries. Judge Locke has been United States District Judge in Florida for twelve years, on a salary of $3,500. According to the petition for his impeachment, which is accompanied with full specifications, affidavits, and the names of witnesses, he has found it necessary to eke out his scanty income by pawnbroking and usury, by illicit dealing in tobacco, and even by keeping a wrecking schooner at work along the Florida coast. His seat on the bench gave him, it seems, peculiar facilities for wrecking, as he was able, sitting in admiralty, to decree himself entitled to salvage for property which, as owner of the good ship *Pelican*, he saved from the perils of the deep. This is by no means the whole of the story, however The Judge is accused of having at election time improperly approached voters and attempted to influence them in behalf of himself and his friends. One witness swears that in a campaign some years ago Locke sent for him, asked him to get as many votes as he could for a State Senator, and handed him some money which he, the witness, used among the "boys." This little fact should be considered in connection with another circumstance of a political nature—that on May 22, 1883, a few

months after the passage of the Civil-Service Act, Dennis Eagan, Internal Revenue Collector for Florida, received a letter from H. C. Rogers, Acting Commissioner of Internal Revenue at Washington, proposing an assessment of $46 88 against the salary of Judge Locke, and requesting him to report why this assessment should not be made.

All this reads like a burlesque written to illustrate the consequences of the treatment of its judges by our Government. First we have a judge appointed and given large powers in a remote, half-civilized district, where he can easily make himself a petty tyrant, then given a salary which is very much less than a lawyer fit to have such a place could make at the bar. Then we see his salary suddenly taxed by the officers of the Government which appoints him, in violation of a law just passed to prevent such exactions, and to "help the party"; and finally we are told that the judge has been recouping himself by bribery and corruption, and illicit trade, and will have to be removed. Judge Locke may be a very bad man, but how are we ever to get good Federal judges with such a system?

Mr. Frederick Douglass's marriage at the age of seventy to a white woman has excited a considerable amount of odd debate. Colored critics generally condemn it as a sort of unfaithfulness to his own race. The *Independent* of this city, however, commended it as a benevolent and patriotic enterprise, inasmuch as Mr. Douglass's example will probably encourage other colored men to marry white women, and thus lead to that amalgamation of the races which is to be the only true and radical solution of the negro problem. Against this startling view the Rev. Dr. Crummell, the colored pastor of a colored church in Washington, lifts up his voice in a very shrewd and forcible sociological essay in the *Independent*. He contends that the advice of the *Independent* is substantially advice to colored men to neglect colored women, already the most forlorn class in the community, and leave them without husbands, for white men will not marry them. If any considerable body of colored men took unto themselves white wives, there would be a corresponding number of colored women left, not in single blessedness, but, according to Dr. Crummell, in a condition of discontent which would end in great immorality. Our advice to both disputants is, however, not to become excited over the matter, for we are sure the discussion is strictly academical. We do not believe, in other words, that any number of colored gentlemen worth mention will succeed in procuring white wives in consequence either of Mr. Douglass's marriage or of the *Independent's* article. Mr. Douglass has exceptional advantages, both in personal appearance, history, and social position, and then he married his amanuensis, or, in other words, a member of a very susceptible class. Nor do we think the writer of editorials in favor of mixed marriages takes on himself any very serious responsibility. White women will always read such compositions with a certain distrust, when presented by black suitors, no matter how powerful the argumentation. It must be remembered, too, that women rarely marry for the public good, or as a contribution toward the solution of a political problem.

W. B. Cash, one of the two hopeful sons of the "Colonel" Cash who killed Shannon the lawyer in a duel two years ago, and was acquitted by a South Carolina jury, has just murdered two men in the street, one of them the policeman who had arrested him the day before for being disorderly, and the other an innocent bystander. He has since fled, after spreading "gloom" through the community, and parties of lynchers are in pursuit of him. This man is one of the great multitude of drunken armed ruffians who pass as "gentlemen" and descendants of Cavaliers at the South, and are the curse and scourge of her society. The father, the Colonel, is of course the worthy parent of such offspring, and yet so strongly does the diseased public opinion of the region bolster up such people, that Shannon, an elderly lawyer in good standing, and a peaceable and respectable man, felt obliged to meet old Cash in a duel to give him satisfaction for language used in court in the conduct of a cause, and was killed by him in the presence of a large crowd. The whole Cash family, in a really civilized community, would long ago have been serving out terms in some well-regulated penitentiary, for crimes of violence. In South Carolina they run loose till they commit deliberate, unprovoked murder, and then the whole neighborhood has to chase them on horseback, as if they were some kind of wild animal.

One of the good signs at the South is, however, that the local press begins to denounce particular murderers with courage. Formerly they used to confine themselves to denouncing murder in general in such vague terms as not to offend any one of the always numerous local murderers, knowing well that if they did, a street fight would probably be the result. There is at least one such paper in South Carolina, the Charleston *News and Courier*. In Florida, which is more and more sought every year by Northern visitors and colonists, the drunken blackguard "Cavaliers" are making themselves scarcer and scarcer, but there are still traces of their presence, as was shown the other day by the deliberate murder on a hotel piazza of the proprietor, by a man who informed him after shooting him that he had been insulting his wife, which was the first the poor victim knew of it. The Florida *Times-Union*, published in Jacksonville, is making there a good fight for civilization, by preaching, strange as it may sound here, the duty of newspapers to denounce specific murderers, in order to make up for the ignorance and remissness of jurors. Its theory is, that the ordinary Southern murderer is much more sensitive to newspaper criticism than he is to the action of the law. He does not mind being prosecuted, or even convicted, knowing that nothing serious will come of it, but editorial denunciation he winces under, probably from its association in his mind with the horrors of "posting." One of the grotesque customs of the fighting world down there is that if one ruffian calls another names on a piece of dirty paper, and sticks it on a tree or gate post, the other is bound to feel, or pretend to feel, unutterable pain and indignation, and run around after him with a knife or pistol, and have no sleep or appetite till he "cuts" him or shoots him.

The *American Literary Churchman* makes some very useful comments on the proposal to try the Rev. Heber Newton for heresy, which some of his clerical assailants can hardly read without benefit. It points out that he would have to be tried, under the Church law of this State, in case the Bishop directed a trial, by a court composed of five clergymen chosen by the accused out of a list of twelve nominated by the Bishop. Of these five, three would constitute a quorum, and a majority would be competent to decide all questions submitted to them, so that Mr. Newton might either be convicted or acquitted by two clergymen, or, in fact, by one clergyman having a casting vote. But such conviction or acquittal would mean the decision by this one clergyman what was or was not the doctrine of the Protestant Episcopal Church touching the authority of the Scriptures, and not only this, but whether Mr. Newton had or had not contravened this doctrine in a large number of sermons. Of course the vote of one clergyman on such a point, though it might condemn Mr. Newton, would have no weight whatever as an expression of the opinion of the Church. Nor, if the whole five concurred, would their dicta be accepted as the opinion of the Church. Moreover, no counsel would appear at the trial unless the accused chose to employ them. The *Literary Churchman* contrasts this with the elaborate arguments of leading members of the bar which accompany the trial of all important ecclesiastical causes in England, and concludes with an expression of devout thankfulness that Bishop Potter has been vouchsafed the wisdom and discretion to let the Rev. Heber Newton alone.

General Graham's force, numbering, it is said, about 4,500 men, has moved out of Suakim to attack Osman Digma, and a battle will probably take place on Friday if Osman stands his ground. If he does stand and is defeated, all will be well. But the danger is that he will not stand his ground; that is, that he will retire into the desert and do what he can well afford to do, but his adversaries cannot—wait. Should he adopt this policy, General Graham's position will be a very awkward one—for pursuit would be madness. Moreover, it is rather alarming to hear that the camel-drivers of the force are to be mutinous or cowardly Nubian soldiers, who have refused to fight. This is serious, because the tactics in the fight—if fight there be—will have to be precisely what Lord Chelmsford's were in Zululand, and what Hicks Pasha's were in the Sudan, and what the tactics of small bodies of regulars acting against swarms of light-armed barbarians must always be. The British will have to receive the Arabs in a square, and the camels and camel-drivers will have somehow to be got inside of the square, or form one side of it, and if they stampede or "cut up" in any way there might be a catastrophe of some kind, and a British disaster would be really a serious matter.

SUMMARY OF THE WEEK'S NEWS

[WEDNESDAY, February 20, to TUESDAY, February 26, 1884, inclusive.]

DOMESTIC.

THE Senate on Monday passed the McPherson Currency Bill by a vote of 43 to 12. Its essential feature is "that upon any deposit, already or hereafter made, of any United States bonds, bearing interest in the manner required by law, any national banking association making the same shall be entitled to receive from the Controller of the Currency circulating notes of different denominations, in blank, registered and countersigned as provided by law, not exceeding in the whole amount the par value of the bonds deposited; provided, that at no time shall the total amount of such notes issued to any such association exceed the amount at such time actually paid in of its capital stock."

The House Committee on Banking and Currency on Tuesday morning instructed Mr. Wilkins to report the McPherson bill, and on the third Monday in March to ask, under a suspension of the rules, that a day be set for its consideration. It was especially stipulated that this action should not be considered as an adverse expression of the Committee on the Potter bill, now before the Ways and Means Committee.

The House bill for the relief of Gen. Fitz-John Porter has been favorably reported in the Senate and made the special order for March 12.

The Shipping Committee of the House on Monday voted six to three to report adversely the bill to admit foreign-built ships to American registry free of duty.

Representative Belford has prepared a bill for introduction in the House, providing for the establishment at West Point of a preparatory school for candidates for admission to the Military Academy.

There is pending before the Committee on Foreign Affairs of the House of Representatives a very stringent bill by which it is proposed to amend the Chinese restriction act, and to provide more exacting regulations as to the passports which are given to certain classes of Chinese. The Chinese Government, through its ambassador in Washington, has just sent a communication to Congress, in which it says that, in view of the agitation of this subject by the American Congress, it has determined not to give any certificates to Chinamen of the classes referred to, and not to permit any to embark for the United States. The bill which the California members, therefore, are so persistently urging before the Committee, if enacted, would be aimed at a man of straw.

The House Committee on Foreign Affairs decided on Saturday to take no action in regard to the Lasker incident for the present, until all the documents in the case arrive.

Speaker Carlisle has received a letter addressed to him personally by several of the most prominent members of the Liberal Party in the German Reichstag, expressing their appreciation of the action taken by the House of Representatives in memory of Herr Lasker.

The British Government has presented to the United States, for the use of the Greely Relief Expedition, the *Alert*, which was the advance ship of the expedition under Sir George Nares. The President has accepted the gift with the thanks of this nation. The Senate, also, on Tuesday passed a resolution thanking the British Government for the *Alert*. In the House, "Richelieu" Robinson objected to the consideration of the resolution.

Chief-Engineer George Melville will accompany the Greely Relief Expedition as engineer of the advance ship *Thetis*, commanded by Captain Schley.

The steamer *Frisia*, with the bodies of De Long and his comrades of the *Jeannette* expedition on board, arrived at Hoboken on Wednesday. On Friday they were conveyed to the Brooklyn Navy-yard, followed by an imposing procession of military organizations. Public funeral services were held in the Church of the Holy Trinity, in this city, on Saturday, and the bodies, with three exceptions, were afterward interred at Woodlawn Cemetery. Friends have charge of the other bodies, and they were interred at different places.

A call for $10,000,000 3 per cent. bonds was issued by the United States Treasury Department on Thursday.

President Arthur on Thursday renominated Mr. Burchard to be Director of the Mint.

The Secretary of State received a despatch from Minister Foster, at Madrid, on Monday, announcing that James R. Partridge had committed suicide at Alicante, Spain, where he was residing on account of ill-health. Mr. Partridge was for many years a diplomatic representative of the United States in Honduras, Brazil, and Salvador. He was appointed Minister to Peru in 1882, and was recalled by Secretary Frelinghuysen in the early part of 1883 because of his unauthorized action in uniting with the diplomatic representatives of Great Britain, France, and Italy in Peru in a joint memorandum, asking that their Governments should request Chili to make peace on certain terms.

United States Minister Hunt is dying in St. Petersburg, Russia.

The investigation of the Danville (Va.) outrages has been in progress at Washington during the week, and of the Copiah (Miss.) outrages, at New Orleans. There was a great deal of testimony to prove the intimidation of the negroes by the whites on the one side, and their insolence on the other. The House Committee investigating the charges of ex-Speaker Keifer against Gen. H. V. Boynton, a newspaper correspondent, was also in session for several days at Washington. No report has yet been made.

The National Democratic Convention is called to meet at Chicago on July 8. The Territories are invited to send delegates, subject to the decision of the Convention as to their admission. A National Greenback Convention is called to meet in Indianapolis on May 28.

About 300 Independent Republicans sat down to a Washington's Birthday dinner in the Assembly Rooms of the Brooklyn Academy of Music on Friday evening. There were representatives of this city, Brooklyn, Boston, Philadelphia, Buffalo, Albany, and other places. Speeches were made by Frederic Cromwell, Carl Schurz, President Seelye, of Amherst College, and others. The tenor of the remarks was entirely against Machine methods and sectional agitation. Mr. Schurz sounded the keynote of the meeting when he said: "The real element of strength for the Republican party is the popular belief that it contains the elements of reform in sufficient preponderance to direct its policy. The views that shape administrative reform will be the issues of the coming campaign."

On Saturday morning a large body of representative Republicans, called together for a conference in regard to nominations for the Presidential contest, met in this city. Speeches of a similar tone to those at the Brooklyn dinner were delivered, and resolutions were passed as follows: That it is indispensable to the success of the Republican party that the character, record, and political associations of its candidates for President and Vice-President of the United States should be such as to warrant entire confidence in their readiness to defend the advances already made toward divorcing the public service from party politics, and to continue these advances till the separation has been made final and complete; that no interference with the free choice of delegates to the National Convention by Congressional districts should anywhere be tolerated; that the interests of the Republican party imperatively demand that the management of the State and national campaign be confided to men whose character and record are such as to command the unhesitating support and confidence of all members of the party; and that a committee be appointed to carry out these views.

The New Jersey State Republican Convention is called to meet in Trenton on April 23.

Mr. Roosevelt's bill to give the Mayor of New York city the sole power of appointing heads of departments was passed by the Assembly on Wednesday by a vote of 70 to 51.

The Prison Labor Commission sent in a report to the Assembly on Wednesday representing that the time accorded to make a report is insufficient, and requesting that ample time for an examination of the whole matter be conceded them. In the meantime they think the subject should not be in any way complicated by a renewal of the existing contracts or awarding of new ones: let these wait until the report is ready. The Commission is informed that no contracts except one small one will mature for two years.

On Thursday the Comstock bill, which prohibits the making of further prison labor contracts, was passed by the Assembly with only one negative vote.

The Judges of the New York Court of Appeals wore for the first time on Monday silken robes, in accordance with a recent request from the State Bar Association.

George William Curtis has accepted the invitation of the city of Boston to deliver a eulogy on Wendell Phillips in Tremont Temple on April 16.

The Dartmouth College Faculty has refused to adopt the resolutions for the regulation of intercollegiate athletics.

Salmi Morse, the author of the "Passion Play," which he tried to produce in this city last winter, was found drowned in the North River on Friday. He had lately been depressed in spirits on account of ill-health and business troubles, and it is supposed that he committed suicide.

A terrible explosion of fire-damp occurred in a coal mine four miles from Uniontown, Pa., on Wednesday. Nineteen miners were killed.

Reports were received on Wednesday of a great tornado on the previous day in Georgia, Mississippi, North Carolina, Kentucky, and other Southern States. The loss of life in some localities was very great. Serious floods were also reported from Southern California.

FOREIGN.

General Gordon has been carrying on his work of reform at Khartum successfully. Unjust debts have been cancelled, and prisoners were released. The clause regarding slavery in his recent proclamation is: "I desire to restore your happiness, and so I have decided to permit slave traffic. Every one having domestic servants may consider them his property and dispose of them." After the full restoration of order at Khartum, General Gordon will proceed to Kordofan, where he will interview El Mahdi in order to learn the fate of Hicks Pasha.

Khartum was reported to be tranquil on Tuesday. The market is full of Arabs daily, who freely bring in their produce on foot. The price of vegetables has fallen one-half since General Gordon's arrival.

General Gordon's recent proclamation is losing its effect. El Mahdi is marching on Khartum. Gordon has published another manifesto, in which he informs the insurgents that the Sultan, the Commander of the Faithful, intends to despatch a great army to conquer their country. General Gordon exhorts them to accept his offers of peace in order to preserve themselves from a Turkish invasion. He has asked the Khedive to issue a decree confirming the independence of the Sudan. On the other hand, the Porte has warned the Khedive to maintain its

integrity. This dilemma has led to fresh rumors of the Khedive's abdication.

Great uneasiness was felt at Cairo on Monday at the report that the powerful Beshareen Arabs had revolted. They occupy the territory between Khartum and Wady Halfa and eastward as far as Berber. If this is true, General Gordon with Khartum and the other garrisons is cut off.

It was positively asserted in Constantinople on Monday that El Mahdi and King John of Abyssinia had signed a convention to the effect that King John should remain neutral, and in return receive a port on the Red Sea and a large accession of territory.

The Tokar Relief Expedition consists of about 6,000 men, including all branches of the service. Twelve hundred of them were at Suakim and 4,300 near Trinkitat on Friday, preparing to advance simultaneously to the relief of the besieged town. On that day news was received that the garrison at Tokar had surrendered. The Governor of that city had a conference on Wednesday with Osman Digma, the result of which was that he accepted the rebel's terms. One account says that only those of the garrison who had wives surrendered; the remainder were trying to reach Suakim. It is not believed that the rebels put the population of Tokar to the sword. The greatest excitement prevailed in London over the news. On Saturday Admiral Hewett, Baker Pasha, and General Graham started for Trinkitat. Osman Digma was on that day reported at Teb, eager to fight.

The whole British expedition landed at Trinkitat on Sunday. Rebels could be seen on all sides. It is estimated that there are 18,000 of them in the immediate vicinity. The British Secretary of War on Sunday ordered an immediate advance to be made from Trinkitat. The news of the surrender of Tokar spread throughout the Sudan as an English defeat, and had a great effect on the rebels.

One thousand British troops advanced four miles on Tuesday from Trinkitat, and occupied Baker Pasha's fortifications. The enemy retired waving their spears. It is expected that a battle will take place on Friday, and that the point of attack will be three miles northeast of Trinkitat.

The men-of-war at Suakim fired during Monday night to keep the rebels at a distance. The condition of affairs there is critical.

In the House of Commons on Monday Mr. Labouchere moved an adjournment in order to discuss the position of the troops along the Red Sea. Several attacks were made on the Government policy in Egypt, which was defended by Mr. Gladstone and the Marquis of Hartington. The motion was defeated. A Parnellite motion to appoint a standing committee on Irish affairs was rejected, 100 to 40.

Mr. Vincent, the financial adviser to the Khedive, is going to England to urge a scheme of Egyptian financial reform. The outlines are as follows: The suspension of the sinking fund provided for under the liquidation law; the reduction of the interest on the Suez Canal bonds held by England to 2 1-2 per cent.; the taxation of resident foreigners, and the reduction of the army and civil administration. The total which it is estimated will be realized by these reforms is over $5,000,000 yearly.

A meeting of the Suez Canal bondholders, representing 25,000 shares, was held in Paris on Friday. It was unanimously resolved that the agreement made by M. de Lesseps with the British shipowners was unacceptable.

Sir Edward Thornton, British Minister at St. Petersburg, has been directed by his Government to ask of the Russian Government a full explanation of their annexation of the Merv Oasis. Minister Thornton is at the same time to protest against this action as a breach of the assurances given to England by the Czar Alexander. It was stated in St Petersburg on Monday that Russia had voluntarily offered England a pledge to stop at Merv, and to use her influence with the Khans of Bokhara and Khiva to facilitate English commerce. It was further stated that the Russian Government had invited England to join in constructing a canal from the Sea of Aral to the Indian frontier.

In the House of Commons on Wednesday Mr. John O'Conner Power, Home Ruler, resumed the debate upon Mr. Parnell's amendment to the address in reply to the Queen's speech, and made a severe arraignment of the Parnellite party. The Parnellites had, he said, been pursuing a policy adverse to the interests of Ireland since the Land Act was introduced. It was in consequence of this that he had separated himself from the Nationalist movement, which had impeded beneficial legislation, and had imposed upon Ireland three years of the most stringent and hateful legislation which had ever been imposed upon any country. The speech caused a great sensation in the House, which was crowded. Messrs. Healy and Justin McCarthy replied. On Friday the House rejected the amendment by a vote of eighty-one to thirty.

The Conservative members of Parliament met on Thursday morning. They decided to support the election of Mr. Arthur Wellesley Peel, the Government candidate for the Speakership. Speaker Brand announced his resignation on Friday. On Monday, when he formally retired from the chair, Mr. Gladstone made a motion which was carried, eulogizing his course. He has been raised to the peerage with the title of Lord Hampden.

Sir Arthur Wellesley Peel, youngest son of the late Sir Robert Peel, was on Tuesday unanimously elected Speaker of the House of Commons.

The House of Commons on Thursday reaffirmed its previous resolution forbidding Mr. Bradlaugh to take the oath, by a vote of 226 to 173. Mr. Bradlaugh says if the courts decide against him he will resign his seat and not seek a reëlection.

The House of Lords on Friday passed a motion to appoint a commission on the housing of the poor. The Prince of Wales made a speech upon it, and was appointed a member of the commission.

Mr. Gladstone has offered Mr. Goldwin Smith the Professorship of History at Oxford. In case Mr. Smith declines, the position will be offered to Dr. Edward A. Freeman.

It is rumored that Henry Irving will be solicited to contest a Parliamentary constituency in the Liberal interest in the next general election.

A terrible dynamite explosion occurred in a cloak room at the Victoria Railway station in London about 1 o'clock on Tuesday morning. A large portion of the roof was blown off and nearly all the glass-work in the station was destroyed. Extensive damage was done to surrounding property. All trains had ceased running and only a few persons were in the station. But two persons were injured, and they slightly. The deed is attributed to the same persons who caused the explosion at the Praed Street station of the Underground Railroad several months ago. The damage caused is estimated at about $20,000.

The Berlin *Official Gazette* published on Wednesday the communication of Prince Bismarck to the German Minister at Washington in regard to the Lasker resolution. In it he said: "I should have gratefully accepted the communication made by Minister Sargent, and should have asked the Emperor to empower me to present it to the Reichstag, if the resolution had not contained an opinion regarding the object and effect of Herr Lasker's political activity which was opposed to my convictions. According to my experience of the political-economic development of the German people, I cannot recognize the opinion as one which events I have witnessed would justify. I cannot determine to ask the Emperor for the necessary power to communicate the resolution to the Reichstag, because I should have officially to advocate before the Emperor an opinion which I cannot recognize as correct."

Bismarck's organ, the *North German Gazette*, said on Thursday that the request addressed to Prince Bismarck by Minister Sargent was of such a remarkable character that it could only be explained by his ignorance of diplomatic usage. It amounted to nothing less than asking the Emperor to endorse the vote of a foreign body and to hand it viséed to the Reichstag, for Prince Bismarck's duty is simply to execute the commands of the Emperor. Prince Bismarck is not in the employ of the international democracy, but of the German Emperor.

The Berlin *National Gazette* said: "Prince Bismarck's decree is deprived of all sting for Congress and the American people because the whole affair is made entirely a matter of internal German policy. It is doubtful, however, whether it would have been necessary to trouble the Emperor regarding such a purely formal matter as handing the Lasker resolution to the Reichstag."

The London *Times* says of the Lasker incident: "At last Prince Bismarck has obtained an opportunity to show his dislike of the country which annually robs him of thousands of conscripts. Congress was ill-advised in sending the resolution; Prince Bismarck was ungracious in returning it. Granting, however, that Prince Bismarck was right in refusing to praise Herr Lasker, his organs are wrong in reviling Minister Sargent. The latter was only obeying his Government."

The London *Standard's* Berlin correspondent, in a telegram on Monday, said: "The independent papers are bitterly complaining at the dishonorable semi-official attacks upon Minister Sargent, who has never been popular in official circles here. The inspired press pretends that he is unpopular because he is merely a politician, and not a scholar, like his predecessors. The real reason, however, is that Mr. Sargent does not regard his position as a sinecure, but energetically fulfils his political duties, which fact often occasions difficulties."

The recent interviews at Berlin between Prince Dolgoruki and Prince Bismarck have resulted in the assent of the latter to a meeting in the spring between the Czar and Emperor William.

A Commission of the Russian General Staff is elaborating a vast scheme of reform in the administration of the Merv district. The Turcomans are urging the retention of native institutions.

M. Clémenceau has recently returned to Paris from a visit to London. He expresses himself as much pleased with the tenement dwellings of workingmen in London. He was horrified, however, at the slums, which surpass in degrading filth and wretchedness anything to be seen in Paris. The infiltration of socialism into English politics struck him as a remarkable sign of the times.

M. Benjamin Ulmann, the French painter, died on Tuesday at the age of fifty-five. He had often exhibited at the Paris salons and had received three medals. The decorative paintings in the Court of Cassation and other public rooms were the work of his brush.

François Bonheur, a brother of Rosa Bonheur, and a painter of some celebrity, is dead at the age of sixty.

The death is announced of the distinguished French Generals Emmanuel Félix de Wimpffen, aged seventy-three, and Jean Paul Adam de Schramm, aged ninety-five.

Prince Krapotkine, the Nihilist, is dangerously ill in Clairvaux Prison, France. His doctors say that he will die unless removed to more healthful quarters.

The French General Millot, commander o the land forces in Tonquin, has left three battalions at Sontay and three at Haiphong, and is preparing to operate against Bacninh with 9,000 men.

THE SILVER CRISIS.

THE announcement that the Treasury Department has intimated to the Clearing-House Association that it may become necessary to pay the Government's balances in silver, is fraught with very momentous consequences. The thing to be decided is, whether the business of the country shall be conducted on the gold standard, or on the silver standard, or on two standards simultaneously. The Silver-Coinage Act, and the incessant piling up in the Treasury of a kind of money which cannot be used, have at last brought us to the edge of a crisis which has been foreseen and predicted from the beginning. It is better, far better, to meet the issue now, while the amount of silver on hand is a manageable quantity, than to wait till it reaches unmanageable proportions. The Secretary of the Treasury is not to be censured for the step he has taken. On the contrary, he is entitled to the thanks and commendations of the business community for precipitating an issue which could not be postponed much longer in any case, and which must find its ultimate solution not in a war of words, but in the clashing of facts.

A brief explanation of the mode in which the Government conducts its business is needed in order to appreciate the significance of the step which has been taken. New York, as the financial centre of the United States, the place where the bulk of the country's exchanges are effected, and where the larger part of the customs revenue is received, is the most convenient place for the Government to make its general disbursements. In order both to receive and to pay out money in the large sums which it has to handle, in a speedy and economical manner, the Sub-Treasury meets the banks every day at the Clearing-House, passes in the checks which it holds against the banks, receives those drawn upon itself by the Treasurer at Washington, and which have found their way hither through bank channels from every part of the country, and either pays to or receives from the Clearing-House the balance resulting from a comparison of the two accounts. In other words, it acts and is acted upon, so far as the "clearing" goes, just like any other member of the association. Clearing is a mechanical operation, which the Government avails itself of as a labor-saving machine.

The Sub-Treasury might leave the Clearing-House and go back to its old system of making all its payments and taking in all its receipts over its own counter, but while it remains there it must obey the rules of the Association, as it has agreed to do. One of these rules provides that all balances shall be paid either in gold or in United States legal-tender notes. The resolutions adopted by the Association, with the concurrence of the Secretary of the Treasury, on the 12th of November, 1878, have kept, and will continue to keep, all the money on deposit in the banks of New York at par with gold, whatever may be done by the Government or by banks elsewhere. The Boston Clearing-House passed resolutions similar to those adopted here, but no action was taken on the subject in other cities.

We do not understand that any step has been taken further than to obtain the opinion of the Clearing-House as to the effect of the Government's giving notice (if it should be forced to do so either by financial or political exigencies) of its intention to pay silver dollars, instead of gold or greenbacks, in the settlement of its debit balances. It can do so —that is, it can abrogate the rule so far as itself is concerned—by giving thirty days' notice, but not before. While, therefore, it has only made an inquiry, and may do nothing more at present, yet the situation and the inquiry both point to action of some kind, and it is well that the step is taken before the silver crisis becomes utterly disastrous. The amount of silver in the Treasury now is only one hundred and twenty millions, or little more than one-half the amount usually held by the Bank of France. The quantity in France, however, is a fixed quantity. It cannot be increased, because the Government refuses to coin any more. Ours is an increasing quantity, and no limit, not even the limit of the public demand, has been placed upon it. No time for grappling with such an evil can be deemed too early. Congress has had abundant opportunity to consider and act upon it, but has neglected to do so. It is plain that another year could not be allowed to pass without so reducing the Government's gold balance that it would be forced to pay out silver for its current requirements. It is by all means advisable to take this step while Congress is in session in order that legislative remedies may be applied if there is any disposition to apply them, and that the responsibility for not applying them may fall where it belongs.

The straight issue is, whether the money of the country and the standard of value shall be gold or silver. This will not be decided by speeches or votes, but by the action of the business community. Will any bank, can any bank, receive from depositors silver worth eighty cents to the dollar, and pay out gold on depositors' checks worth one hundred cents to the dollar? Will any depositor deposit gold or gold value in a bank where he may expect to receive silver or silver value in return? These questions answer themselves. If any bank should be so far forgetful of its own interests as to distribute its capital to its customers by taking in 80-cent dollars and paying out 100-cent dollars, it would very soon be without either customers or capital. Such a course of procedure is unthinkable from a business-man's point of view. There is no way to make two unequal things equal to each other. There is no way to compel the business community to esteem silver as highly as they esteem gold. Therefore no legislation can cause the silver dollar and the gold dollar to pass on an equality, either inside or outside of the banks, unless the Government redeems the silver dollar as it redeems the greenback dollar at the Treasury.

The political consequences of the silver crisis, if it is to come now, or whenever it does come, will be very important. It is quite evident that the silver craze which raged with such violence in the West and South a few years ago has died out except in the silver-producing States and Territories, where the Silver-Coinage Act is looked upon rightfully as a measure of "protection to American industry"—in other words, as a means of securing a steady market for the product of the mines, at good prices. In the Eastern States, and especially in New York, no other issue would so surely wreck the Democratic party as any disturbance of business resulting from that party's neglect or refusal to suspend the coinage of unused silver, the existing mass of which constitutes the most serious menace to the prosperity of the country.

THE REGULATION OF COLLEGE SPORTS.

THE resolutions of the recent intercollegiate athletic conference have called out a chorus of disapproval from several quarters, and it is evidently more than doubtful whether five colleges can be got to approve them. Harvard and Princeton have adopted them. Brown will probably refuse. There is no chance that Yale will accept them, and even if Columbia and Wesleyan should, the defection of Yale will make any attempt at union nearly impossible. Whether we call Harvard and Yale universities or only colleges like the rest, they are so much larger, and their stake in the matter is so much greater, and the competition between them so much keener, that for the success of an intercollegiate athletic code the support of both is required.

The discussion as far as it has gone (and it will no doubt be renewed) has brought out one or two points of considerable interest. The first of these is, that the idea prevails among a considerable body of students, that the regulation of sports is something with which the faculties of colleges have nothing to do. This is all the more remarkable because it is only within a generation that sports have obtained any recognition in American colleges. Fifty years ago the idea that athletics were a branch of education, or that competition in them was to be encouraged, was unknown in American colleges, and any attempt to foster it would have been quickly stifled by the faculties. These bodies, which were then composed of teachers of a somewhat ascetic type, looked with coldness upon, if they did not actually resist, the great modern athletic revival, which, in and out of college, has become so marked a feature of our time; but no one ever dreamt till now that they had nothing to say about it. They must have a voice in it as long as they have a voice in college discipline at all. The health of students, the occupation of their time, and their morals are all affected, and unless the colleges are going to abdicate all their disciplinary functions and convert themselves into lecturing and examining machines, they will always have to exercise some supervision over sports. To take what may seem to some readers to be an extreme case, but is really not so, if a college nine were to "take the road," as theatrical companies do, under the management of a professional, and play through the country against all comers, for money, the transaction could hardly fail to raise the question whether the money and the scores were a sufficient offset to the degradation of college sports involved.

But there is a wide difference between the exercise in each college of a general supervisory power over sports, and the attempt to establish an intercollegiate code, as a glance at the resolutions themselves will show. They bring out very distinctly, the moment we examine them in detail, the fact that there is so great a dissimilarity, first, in the circumstances of the colleges, and second, in the character of the sports themselves, that any attempt to make up such a code will be attended with enormous if not insuperable difficulties.

The first resolution is, that any "director or instructor in physical exercises or athletic sports" must be appointed by the college and his name announced in the catalogue. There is no objection to this resolution, apparently, and we only mention it here because it emphasizes the fact that the function of physical education is already recognized generally by the colleges. The next resolution is, that "no professional athlete, oarsman, or ball player shall be employed either for instruction or for practice or preparation for any collegiate contest." This, of course, raises the question what is a "professional," as to which, as many of our readers know, there is a vast body of learning in existence, but as yet no common agreement. Assuming that the word is here used roughly to denote any one who is not an undergraduate, and who rows or plays ball as a matter of business, it seems rather hard that a college nine or crew should not have a right to get themselves coached by such a man. The objection mentioned in the resolution is that the crew or nine with a professional coach would have an advantage over crews and nines having no coach; that, therefore, professionals would be employed, if at all, universally, and that this would tend to assimilate the "tone" of undergraduates with that of professionals, whose character is often low and whose motive is mainly mercenary. But why? Coaching by professionals cannot of itself make the motive of undergraduates mercenary, and nothing can prevent the motive of undergraduates being the desire to win, if possible. It seems, too, that it is a mistake to suppose that the employment of a professional coach by one college forces its rival to employ a professional. In rowing, the introduction of the "English" stroke was due to the discovery of it at Oxford, and all sorts of experiments with professional coaches have failed to induce a belief that for college races any professional stroke can be found that is better.

The next resolution, with its reasons, is as follows:

"Much of the expense and loss of time attending the practice of college sports is occasioned by playing games at a distance; yet for various reasons it seems advisable that intercollegiate contests in these sports should be continued. They develop strength and executive ability, as well as courage, presence of mind, and other important elements of character. They give students an opportunity to measure their physical powers with others, and, when conducted in the right spirit, tend to make friends of rivals and to subordinate class feeling to college unity. For these reasons, these games ought to be more generally played in college. Class nines and foot-ball teams should be formed as well as class crews; and the university teams should depend more largely upon these organizations for practice. If the base-ball nines of one college practise with expert amateur clubs because such clubs exist in their vicinity, this compels the nines of other colleges, not so favorably situated, to practise with inferior amateur organizations, regular professionals, or, what is more to be regretted, with undisciplined semi-professionals. Therefore,

"3. Resolved, That no college organization shall row, or play base-ball, foot-ball, lacrosse, or cricket, except with similar organizations from their own or other institutions of learning."

This prevents all play with professionals; and it is obvious that there is a difference between play with professionals—which may be likely to lead to a lowering of the "tone" of sports—and coaching by professionals. But here there is a difference again, arising from the character of the sport. There is never likely to be much trouble about rowing with professionals, because professional rowing men always beat college amateurs, and there is a certain absurdity in contests between them. In base-ball, we believe this is not so; and in the smaller colleges, where it is difficult to get up more than one good "nine," unless this nine is allowed to practise with professionals it cannot practise at all.

The sixth resolution, that no game shall take place except upon the home ground of one or other of the competing colleges, is designed to break up the practice of playing match games in large cities, and drawing crowds for the sake of gate money. But are not great crowds drawn to Yale and Harvard for gate money? And what are we to say of Columbia, whose consent to these resolutions is asked, which is situated in a large city, and which has no home grounds?

The seventh resolution forbids boat-races longer than three miles. The important ground for this is the danger to health from a four-mile race. But if there is any such danger, any college which recognizes it will have to stop four-mile races whether other colleges do or not. If Harvard and Princeton believe that four miles is too long a course, and it can be proved by medical authority, Yale and other colleges will almost certainly have to come to the same conclusion.

The fourth resolution provides for a standing committee of the colleges to supervise all contests and approve of all rules and regulations. This, of course, goes vastly further than all the others put together, and if they prove impracticable, it is much more so. It involves the transfer of the whole development of sports from the students to the faculty, and this not to the faculty of one college, but of several, different in circumstances and position and resources. This appears to imply a view of the right of faculties to interfere quite as extreme as the undergraduate notion that the students must be left altogether to themselves.

If we are right in what we have been saying, the difficulty with the present movement lies in its having attempted too much, and consequently a revision of the regulations, with a view to confining them to a much smaller field, and possibly to fewer colleges even than five, seems necessary.

HOW THE SUDAN GOT INTO ENGLISH POLITICS.

THE rapidity with which the affairs of a barbarous and remote African province, which England has never owned or thought of owning, have become the great concern of English opinion, and probably a powerful influence in English politics, is a striking illustration of the part played by the unforeseen in an empire with huge foreign interests. Indeed, it ought to serve as a warning and example to every state which is not yet blessed or cursed with foreign dependencies or protégés.

How came England to get into the Sudan troubles? As usual, she did not sail into them, but drifted into them. Omitting details, the story is shortly this: The Mahdi, or Prophet, had begun to make progress in the Sudan before English authority became practically supreme in Egypt by the battle of Tell el-Kebir. The Egyptian Government could not make up its mind to abandon this vast region to him or to chance, while at the same time it had neither the moral energy nor the material force in men and money adequate to resist him, and reconquer the territories which were yielding to him, or at least escaping from their control. They despatched some troops thither, and placed them under an English officer named Hicks. The representative of England at Cairo, first Lord Dufferin, then Sir Edward Malet, the Consul-General, then Sir Evelyn Baring, was instructed by the English Ministry not to interfere with the action of the Egyptian Government in the matter. Advice was sometimes given; more frequently it was not given, but whenever the subject was mentioned an emphatic declaration was made that England had nothing to do with the Sudan, and that the Khedive and his ministers must act on their own responsibility. Neither Mr. Gladstone's Cabinet, nor Sir E. Baring, now their mouthpiece in Egypt, seems to have doubted for a moment that the proper course was to abandon the Sudan altogether, and withdraw the Egyptian frontier to a place called Wady Halfa, or even to Assuan, being led to this view not only by perceiving how great a drain upon the resources of Egypt proper the holding of these vast and almost barbarous territories was, but also by the vices, the incurable vices, of Egyptian rule there, which had largely contributed to the revolt of the Sudanese peoples.

That they refused to force this opinion on the Khedive was owing to their resolve to make their occupation of Egypt purely temporary, and let the Khedive's Government stand alone as soon as it was possible for it to do so. And this resolve was in its turn owing partly to Mr. Gladstone's strong aversion to increasing the liabilities and responsibilities of England anywhere in the world, partly to the language he had held in Parliament when the expedition of 1882 was despatched under Sir Garnet Wolseley—language intended to remove the apprehensions of that section of his supporters which considered the expedition a piece of aggression that would lead to annexation; lastly, to the assurances which his Cabinet addressed to the other European Powers

for the sake of disarming their jealousy of English action. These pledges had been so numerous and so explicit, and coincided so fully with the intentions which he had himself entertained when despatching the expedition, that it would have been hard to escape from them even when circumstances changed and events showed the difficulty of leaving the tottering throne of the Khedive to stand unsupported. There is, however, no reason to think that Mr. Gladstone and Lord Granville wished to escape from them, or changed their views as to the propriety of quitting Egypt at the earliest possible moment.

In November the catastrophe came. Hicks's army in the Sudan was annihilated. It was plain that Egypt could not, of herself, reconquer the country—could not even defend the city and fortress of Khartum, whose position, at the confluence of the Blue with the White Nile, gives it an especial importance. The question arose whether England should intervene by sending English or Indian troops either to reëstablish Egyptian authority and hold Khartum, or at least to insure the safe withdrawal of such garrisons as remained in the country. Fearing that to send troops would involve the permanent occupation of part of the Sudan, and the creation of an English empire in Equatorial Africa, Mr. Gladstone's Cabinet refused to do so, but went so far as to advise the Egyptian Ministry to withdraw its garrisons and abandon the Sudan. When, after much delay, it appeared that the Egyptian Ministry would not follow this advice, England went a step further, quitted her attitude of irresponsibility, and, early in January, told the Khedive that if his ministers would not comply with her wishes he must dismiss them. He did so, and the present Ministry of Nubar Pasha came in to obey her directions. But meanwhile time had been lost. The position of Khartum had become much more perilous. Although the Europeans there have no claim upon England, since they went out either in the service of the Egyptian Government or as traders on their own account, public sympathy was roused on their behalf, and the feeling grew stronger and stronger that the British Government ought to take some steps to rescue them.

The newspapers cried out for this, as they generally cry out for some sort of action. The humanity of many persons who held that, as a matter of mere obligation, the Government had nothing to do with the matter, was aroused, and the accounts which came of the terrified and disorganized condition of the refugees in Khartum told daily on their hearts. That large class who had all along desired that England should strengthen her hold on Egypt, and proclaim a formal protectorate over it, swelled the cry for intervention in the Sudan, because they saw that the more she committed herself there the less could she forsake Egypt. They, in fact, desired an energetic interference for the very reasons which made the Government recoil from it. There was soon a cry for the despatch of General Gordon, the one Englishman whose knowledge of the country as well as his military gifts and personal daring, pointed him out as the man for the crisis. The English Government proposed to the Egyptian Ministry to employ him, but the objections raised by the latter took some time to overcome, so that it was not till the end of January that he started. Meanwhile a new source of anxiety started up on the coasts of the Red Sea. Baker Pasha commanded a body of Egyptian troops there. In leading them up from the coast to relieve an Egyptian garrison, he was attacked by a band of natives, Mohammedan Sudanese, half black, half Arab in blood, who had come down from the Mahdi's main forces, and so crushingly defeated him that he had to escape to the port of Suakim, where the guns of British vessels give some protection. The news of this defeat reached England on the very evening when Parliament met, and clouded the spirits of the Government. It was quite unexpected, for his force was supposed to be more that a match for any antagonist; but it seemed to seal the fate of the Red Sea garrisons, who were now left without prospect of relief. Impatience and irritation rose higher in England. The defeat and the impending destruction of the garrison were attributed to the sluggishness or timidity of the Government, which ought, it was said, to have long ago despatched troops from India to the Red Sea coast and prepared to relieve Khartum by a forced march across the desert. The gloomiest prophecies of General Gordon's fate were in every mouth. He was almost alone; his route lay through open and secret dangers; the news of Baker's defeat would embolden the tribes to attack him.

This was the state of feeling which encouraged Sir Stafford Northcote to move his vote of censure. The tension was a little relieved by the intelligence of General Gordon's arrival at Berber on the Upper Nile, from which he ascended the river to Khartum in safety. But it was increased by the subsequent news of the fall of Sinkat, one of the posts near the Red Sea coast, and the slaughter of its garrison.

The effect of all this has been to produce among the Liberals a feeling, made up both of mortified pride and impatience, which has grown keener and keener as week after week has passed without decisive action on the part of the Government. They are vexed that a responsibility which the Government has eventually assumed should not have been assumed sooner, when the misfortunes which have befallen might have been averted. They do not much sympathize with its anxiety to abstain from every possible assertion of authority in Egypt, and are, in fact, pretty well pleased to stay there. They think that it has been too late in recognizing and acting upon patent facts. And they do not like that the troops of a country which is, for the time being, under the ægis of England, should be destroyed and its territories torn away. Such feelings, it is true, do not exist equally in all sections of the party. They are much stronger among the aristocratic and plutocratic sections, telling far less on the bulk of the middle classes. But the fact which is for the moment important is that they fall upon the ministerial party in the House of Commons, and shake the loyalty of some of its members. The feelings of the Conservatives it is hardly necessary to analyze. They imply hold that things are going the way they foretold—namely, that the ministerial want of courage and vigor would sooner or later bring disaster both at home and abroad.

The situation as indicated by the latest news is simply this: England is actually committed to the task of bringing to action some large body of the Mahdi's troops and inflicting on it a signal defeat. Unless she accomplishes this, it is difficult to see how she can escape great discredit and prevent her hold on Egypt itself from being seriously weakened or maintained at great increase in cost. If the Mahdi now defies or escapes her, the army of occupation in Egypt will have to be greatly increased, and the entire work of governing the country assumed by English officials. The most hopeful view is that Osman Digma, the Mahdi's lieutenant outside Suakim, is so elated by his recent successes that he will meet General Graham in a stand-up fight, and try the luck of his spearsmen on the British squares. But if he should adopt a Parthian policy and retire into the desert, the result would be most embarrassing.

OFFICIAL INDIGNITIES TO LASKER.

BERLIN, February 7.

THE funeral of the late Edward Lasker has furnished an inside view into some political and social ethics of our public life. While Mr. Lasker well deserved the homage lavished upon him by the community at large and the most prominent representatives of science, art, commerce, and trade; and while his political friends, as well as the Liberals of all shades, vied with each other in honoring the deceased statesman, our Government was not officially represented at the funeral ceremonies, nor at the burial itself, nor at the public meetings, at one of which Deputy Bamberger delivered an eloquent and in every respect admirable address on Lasker's public services and character. It would show an uncommon degree of simple-mindedness to suppose that there was no design in this absence of our ruling classes. To put it bluntly, Prince Bismarck did not wish that the Government officials should appear in the funeral cortége of a Liberal political man. He did not command them, but he stood silently aside, and his wishes were anticipated by his subordinates.

I very well remember the time when the Chancellor treated Lasker with the utmost attention; when at his receptions he conversed for hours with him, and when he submitted new bills to him, anxious to get the approval of the most influential parliamentarian. As a practical, matter-of-fact statesman, Bismarck holds all idealistic tendencies in utter contempt, and regards only material and mechanical conceptions as entitled to consideration. To him a political man like Lasker is utterly incomprehensible; he scorns him as an idealist, while he hates his support and aid the more as he cannot, or at least could not, realize his aims without his help. Men of practical purposes are comparatively easily won by lending or promising them assistance; idealists, however, cannot so easily be governed, for they are too unselfish, and don't care for a special interest. Their support as well as their opposition is therefore reluctantly borne, and for this reason Lasker never was a favorite with Bismarck. Besides, parliamentarism is not at all liked by our leading statesman. In the present instance it could not better be humiliated than by ignoring or officially for-

getting that one of its most prominent exponents had died. There are not hundreds, there are thousands in Germany who look at parliamentarism as an evil, perhaps merely as a necessary evil. Those who entertain this opinion know very well that they cannot abolish the Reichstag, but they injure it as much as possible, and try on every occasion to discredit and lower it in public estimation. The inner reason, therefore, for this animosity toward a distinguished member of the Reichstag is that with us a small but powerful class of society think themselves privileged claimants of the higher Governmental offices, and try to keep off the parliamentary intruders. To understand the tendency and influence of this coterie, which very adroitly identifies its personal interests with the prerogatives of the crown, let me remark that the Prussians more than any other people are rooted in their dynasty, and that the Hohenzollerns for more than four hundred years have taken the legislative initiative, while our so-called parliamentarism is not yet forty years old.

When in any other constitutional country a public man dies who for years has exercised a controlling influence on the legislative business of the land, even those who during his life-time had been his bitterest opponents unite with his friends in honoring the dead as a man who has deserved well of his country. With us, however, not a single member of the German and Prussian Government saw fit to attend Lasker's funeral; they were remarkable only by their absence, and confounded the dead patriot with their living antagonist. The President and one Vice-President of the Reichstag were present, but the President of the Prussian Landtag, a Mr. von Koeller, did not come. He even declared, a few days before the funeral, that he did not feel disposed to render the last honors to Mr. Lasker, and gave as his reason that some arrogant and anonymous German-American Turners and radicals of Cincinnati, Louisville, and other cities had, in rather unbecoming terms, entreated him to show sufficient courage to take part in the proceedings. He did not even deign by a single word to inform the Landtag, of which Lasker for more than fifteen years had been a most conspicuous member, of his death, nor did he move for resolutions to the memory of the deceased. Sticking to technicalities, Mr. von Koeller justified his conduct by the excuse that Lasker, at the time of his death, had ceased to be a member of the Second Chamber; of the great state man he did not seem to have any knowledge at all. The present rector of the Berlin University, a certain Professor Kirchhoff, added insult to injury by returning the Mayor's card of invitation to the religious services, with the remark that he did not wish to make any use of it. Now, Mr. Lasker had been made honorary Doctor of Law and Philosophy by the Universities of Leipzig and Freiburg, for his merits as a legislator and writer, so that it would have been no more than right that the leading university of the country should be officially represented by its rector. Professors Mommsen, Gneist, and Beseler came. Neither any present minister of state nor a single military officer appeared. Of former state ministers I saw only three—Messrs. von Bernuth, Delbrück, and Camphausen. Mr. Achenbach, who, when entering upon his duties as Minister of Commerce, had recommended himself to Mr. Lasker's good-will and kindness, kept away and did not send a word of excuse. Of foreign diplomatists, only the ministers of the United States and of Greece were present.

Finally, as to the Geheime Räthe (privy councillors), of whom we have several hundreds in Berlin, they were almost all—to use an English-American judicial Latin phrase—"non inventi." As the better part of valor is discretion, they held aloof and did not dare to provoke a possible browbeating from their master. It is owing to the pernicious influence of the present personal régime that our Government's higher employees do not dare to act when they do not know from what quarter the wind blows. Thus gradually they more and more become the pliant tools of their superiors, and the old Tacitean "ruere in servitium" is the order of the day. An old Geheimer Rath complained the other day that he would most cheerfully do what his superiors required of him, if they would only give him directions. "It is always dangerous," said a typical old reactionary, Herr von Gerlach, "to leave our conservatives to their own inspirations (!). These gentlemen require positive directions." "Our country squires and conservatives," said Bismarck, "have no idea of their duties toward the state; they reverentially front their dunghills, and turn their backs to the Government."

Let me state, in conclusion, that the resolutions of your national House of Representatives, as well as the kind sentiments of Messrs. Schurz and White, have been gratefully received by Mr. Lasker's friends, and have stirred a responsive feeling in the hearts of our educated classes, which I am sure will not disappear with the present occasion. † † †

ANTICIPATIONS OF THE PARLIAMENTARY SESSION.

London, February 4.

The session of Parliament which opens tomorrow is universally expected to prove a strong one, and this prediction is made by those who have, like Æolus in Homer, the power of fulfilling it by themselves raising a tempest—that is to say, the active spirits of the Conservative Opposition. During the last four months they have been filling the country and newspapers with invectives against Mr. Gladstone's Ministry, invectives which have increased in vehemence as the hour of Parliamentary conflict approaches; and they now announce that the leading measures of the Ministry are to be resisted, and its foreign policy, particularly in Egypt, formally arraigned. There has been no time, even during the last eight troubled years, when the air was so redolent of battle.

What is the reason for this? To the eye of an ordinary observer there is a strange contrast between this political heat (for the Liberals have been replying to the Tory fire all along the line with equal vehemence) and the condition of the country and her people. We are at peace with all the Powers of Europe, and a peace which seems unlikely to be disturbed. At home there are no problems of a social or economical kind demanding instant solution. Trade is dull, but not duller than it has often been of late years. There is no distress among the working classes, whose condition, as Mr Giffen's interesting statistics show, has been steadily improving for the last thirty years. The socialistic movement, though it causes some disquietude, is repudiated by both parties alike, and cannot be deemed a factor in our politics The measures announced by the Ministry are not alarming, nor can any one suppose that a Cabinet including such Whig or semi-Tory magnates as Lord Hartington, Lord Granville, Lord Derby, contemplates any interference with the rights of property. Our position in Egypt is ill-defined and anxious, but it involves no substantial dangers for England, which can do whatever it pleases there without risk of interference from other Powers. Whichever way one looks, one finds it hard to discover an adequate cause for this extreme bitterness of political feeling, which is likely to make the coming session a troubled and unprofitable one.

Causes, however, there must be, and the two following are perhaps as near the truth as any others. The first is to be found in the personal hostility of the Tory party to Mr. Gladstone and Mr. Chamberlain. Mr. Gladstone is hated not only because he is the triumphant leader who lately and unexpectedly ejected the Tories from a possession of power which they counted on long retaining, but also because he is conspicuously the virtuous statesman, whose friends are fond of pointing to his virtues, and contrasting them with the inferior moral level of other politicians. Moreover, Mr. Gladstone has two qualities which irritate opponents. Although perfectly gentlemanly in controversy, and indeed too proud to descend to personal attacks on his enemies, he has a way of trampling on them in argument, of leaving them not a leg to stand upon, which tries their temper. He is also, notwithstanding his great caution and tendency to qualify general statements and avoid committing himself positively to any course, a lover of general principles, and apt to enunciate some sweeping proposition which seems revolutionary to ordinary minds, and indeed would be revolutionary if it were to be carried out without those restrictions and qualifications which practical statesmanship imposes. Mr. Chamberlain, who now draws most of the fire of the moderate Whigs, as well as of the Tories, is hated even more bitterly. He is a new man, a successful manufacturer; and the intrusion of new men into high political office is still resented by the social cliques which used to monopolize it He is, more distinctly than any person of equal consequence has been before, the leader of popular radicalism. Mr Bright, who was assailed twenty years ago with nearly as much fierceness as Mr. Chamberlain is to-day, was after all rather a champion of the middle than of the working class, and was moreover eminently a man of opposition, who only took office even in 1868 because it was forced upon him, and therefore appeared less dangerous. There is a cool resoluteness about Mr. Chamberlain's attitude which makes men think that when once he gets the helm into his hands, he is capable of steering the ship anywhere, right into the whirlpool of pure democracy.

This brings one to the second reason. The Tory party believe that we are, if not on the eve of, yet at least rapidly approaching, great political changes, and are determined to resist the tendency before it has grown irresistible They concede that the borough franchise must soon be extended to the counties, but they insist that this admission of nearly two millions of new voters must be accompanied by precautions to prevent them from swamping the influence of the upper classes. They believe that a general attack upon property and its holders, and especially upon landed property, is being planned by the radical party, and are prepared to fight hard, if not for their hearths and altars, yet for their parks and deer forests. Those preachers of land nationalization, and other forms of communism, who are now discoursing to the working classes, seem to them merely the advanced guard of a radical army. It is bent on levelling; it will destroy their influence in the counties; it will destroy the Established Church, in which their brothers, sons, and nephews hold livings, and to which many of them are attached on religious grounds also; it will abolish the game laws, and one by one extinguish all the pleasures which they value in life. These are apprehensions which have no doubt been often felt before. They were felt before the extension of the borough franchise in 1867, which placed political power in the hands of the working classes. The working classes did

not, however, at first seem to realize their power. The more complete system of party organization which has lately been created has now made the more numerous party more formidable, and they are aware that they must usually expect to be in the minority. Hence the anxiety to delay any further constitutional changes, or to grasp, if possible, the opportunity of so making them that they shall not seriously disturb the existing control of the wealthier classes.

To these reasons for the militant spirit of the Conservative party, one may perhaps add the fact that many of them feel that more fighting ought to have been done in the last three sessions, and that the Ministry, which was several times in grave difficulties, ought to have been more hardly pressed. Slight reverses might have been turned into routs, whereas the enemy was permitted to draw off in good order. This is an error they are resolved to commit no more. "Was it really an error," some one may ask, "or could they have done no better?" Probably they might have once or twice gained a little by a more sudden and vigorous onslaught, but on the whole their fault has lain not so much in failing to charge the enemy as in failing to detach the waverers in his ranks, who might perhaps have been won by more skilful tactics.

Before these lines reach your readers, the programme of Government business for the session will have been set forth in the speech from the throne. The two most important measures it is intended to introduce are the County Franchise Bill and that for establishing one municipal government for the whole of London. Both of these will be fought, but apparently in different ways. The Conservative leaders do not object to the extension of the same franchise as exists in boroughs to householders in English and Scotch counties. What they declare to be dangerous is its extension in Ireland, and they promise to oppose the bill if it attempts this. They further argue that the redistribution of seats—a step obviously necessary when the county constituencies have been so greatly enlarged—is a matter which ought not to be separated from the extension of the franchise, and that Parliament is therefore entitled to have some security that the two subjects will be dealt with together. The Ministry may perhaps go so far as to present along with the Franchise Bill an outline of their scheme of redistribution. If they do not, the Tory leaders are pledged to oppose the former bill, which they will represent as a leap in the dark. If, on the other hand, the Cabinet does submit a redistribution scheme, it is involved in further difficulties. Should the scheme be a moderate and limited one, the Liberal party will be disappointed and its zeal damped. Should it prove bold and sweeping, the Tories will resist it vigorously, and be reinforced in their resistance by some of those ministerial members of the House of Commons whose seats are threatened. What with these two lines of objection to the measure, and with the numerous points of detail that may be criticised, there is room for plenty of debate and much expenditure of time. Nor is the Government of London Bill likely to prove an easier enterprise. It must necessarily be a very long and very complicated measure, which might be discussed at great length without the appearance of wilful obstruction. It is not, strictly speaking, a party question, but its defeat would damage, its passing would gain credit for, Mr. Gladstone's Ministry, while the present corporation of the city, who are its warmest opponents, are nearly all Conservatives who hold themselves entitled to receive help from their political allies. Among the other proposals of the Cabinet there are several which may easily be fought over, while the troubles in Egypt will furnish for some time to come a ground of attack on which the Ministry are not very strong now, and will be much weaker should any reverse befall General Gordon.

The present probability is that the Franchise Bill will pass the House of Commons by a good majority, but will be thrown out by the House of Lords. Much, however, will depend on the turn which things take before the Lords are called upon to deal with it. If there have been defections in the ministerial ranks, and still more if failures in Egypt and the Sudan have discredited the Government, the Lords will doubtless play for a dissolution of Parliament. If fortune smiles on Mr. Gladstone, they may be unwilling to provoke it, and even in rejecting the County Franchise Bill may interfere so little with other measures as to give the Government less ground for an immediate appeal to the country. Neither party seriously desires to have such an appeal this year. But passion and sudden impulses of hope often lead parties, as well as men, to disregard their sober calculations. Y.

ENGLAND IN EGYPT.

CAIRO, February 4.

THE recent ministerial crisis in Egypt affords a suitable opportunity for reviewing the political circumstances of this country under the English ascendency. A more full light on the English policy in Egypt will be thrown as soon as Parliament reassembles at Westminster. In the meantime, it is worth while summing up the elements of the situation with which either the Egyptian or the English Government, or both Governments combined, are called to deal.

In the first place, it is not fair to Lord Dufferin to impute to him that his scheme of reconstruction has broken down. He took care to point out that there were two alternative courses for the establishment of order and good government in Egypt. One course was such as could be carried into full effect in some five years by the "masterful hand" of the British Resident. The other was that of starting a number of beneficial institutions, lending a limited number of competent English officials to teach the Egyptians how to work them, protecting the country against internal disorder and external invasion, and, within as short a period as possible, abandoning the country wholly to itself. It was about May in last year that the British Government made a decisive election between these rival policies, and inaugurated the second of the two. From that time to this the history of Egypt has been one unbroken story of disasters and disappointments. It is true that the cholera distracted the whole attention of the official and non-official world during the summer, and that the discomfiture in the Sudan in the late autumn introduced new and unforeseen elements in the question. But if such problems had not presented themselves in the first year, they must have been looked for sooner or later, and it is the purpose of good political contrivances to be ready for such incalculable exigencies. Hence the utter breakdown of the frail structure initiated as a *pis-aller* by Lord Dufferin was not due to unfavorable circumstances, but it was fortunate that such circumstances presented themselves so soon that the structure was put to a severe test before any false confidence was reposed in it. If no cholera had appeared in Egypt last summer, and the Sudan expedition had been as successful as it was the reverse, it is possible the sores in Egypt might have been coated over and kept out of sight for a year or two, and only laid bare after the English army of occupation had left, and English influence in Egypt largely diminished. The result would have been that the miseries of Egypt would have been irreparable, or only to be repaired after another revolution, and, probably, another war.

But there are certain parts—and these the chief ones—of Lord Dufferin's policy which are yet on their trial, and which will have to proceed, in one form or another, whatever be the final relations of England to Egypt. These are the constitutional reforms and the organization of a new system of law and of new courts of justice. The constitutional reforms are the part of Lord Dufferin's system which have most attracted the unfavorable criticism of cynical observers. But it is probable that this is just the part of the system which has not failed, and which, if wisely conceived, cannot, in the end, by any possibility fail. The constitutional structure erected by Lord Dufferin, and which has so far shown no symptom of weakness, affords the largest amount of hope for the future political independence of the people; though, for the moment, it places the least possible direct power in the hands of the people while yet ignorant and politically incompetent. The method of election is so indirect, while the basis of the franchise is so broad, that, although every Egyptian is called to be, and act as, a citizen, the political rights of a citizen are, for the moment and by an unfortunate necessity, infinitesimally small.

The centre of the representative system is the Legislative Council, the product of three successive processes of election. Some 6,000 villages elect, each of them, a village spokesman or bearer of the village vote. This is election the first. Every Egyptian of twenty years of age has a vote, and the elections are by ballot and cumulative voting. The village spokesmen, or so-called "electors delegate," form a constituency for the election of a small body or provincial council (election the second), which is again a new constituency for the election of a member of the Legislative Council (election the third). The powers of the Legislative Council are limited to criticism of Government projects and to recommendations for legislation. It is said that the first elections, which took place a couple of months ago, are on the whole satisfactory, and the members of the Council have, at least, just shown their public spirit by declining to be paid their allowances during the present financial pressure. It will be some time—perhaps some years—before the value of the representative system can be tested. The whole administration is at present so lamentably out of gear, that it is only by despotic enactments and direct executive intervention from moment to moment that anarchy can be staved off. In the meantime, the existence of the new institutions is a silent lesson to the people that they are born for freedom and manly independence, and not for slavery; while the exercise of the art of voting will be constantly training them in the practice of a citizen's highest duty.

The other great reform to which Lord Dufferin addressed himself, and which also promises to be of lasting validity, was the inauguration of a completely new system of administering justice. Such a comprehensive experiment has probably never been tried before in any country, and it must be expected that it will be long before the new system can dispense with incessant (and perhaps root-and-branch) reformations. With the exception of the Mahommedan law applying to marriage, succession, and guardianship, the whole law of the country has been entirely recast and embodied in a series of codes; or rather, the old laws have been abrogated in their entirety and new laws introduced in their stead. The old courts, excepting the courts administering the Mohammedan law above mentioned, have been abolished, and new

courts, with a wholly different organization, have been established in their place. New judges, including a limited number of Europeans, have been substituted for the old, and the procedure is entirely new.

Whether the new judicial and legal system thus introduced is the best possible one for the country at the present time will be discovered sooner or later. The system, mainly, is that of France, and the new European judges, in all cases but one, are Dutch and Belgian. Whether the particular system of law, courts, and procedure survives or not, it is certain that Egypt will never be allowed to go back to the haphazard system of hand-to-mouth justice and injustice from which the country has been so valiantly rescued. Thus it cannot be said that, in this respect, Lord Dufferin's reforms were ephemeral, or so much as capable of being affected by the paralysis of Egyptian administration which followed his departure.

Whatever be the effect of the unhappy or culpable supineness of Egyptian officials, the actual state of the finances presents a problem which even the most skilled and willing hands find surpassingly hard to deal with. Owing to the provisions of the sort of international contract which expressed itself in what is known as the "Law of Liquidation," the Egyptian public debt is so regulated that excess of revenue in a certain part of the balance sheet must be applied to paying off the existing debt. The result is, that whatever the immediate financial exigencies of the country, that excess of revenue (if any) cannot be applied to its relief, but a new debt must be contracted on whatever terms may be possible. In the meantime, the demand for money is oppressing every part of the administration. Serious unpopularity is being encountered by the Government through the dismissal of hundreds of employees. The indemnities for losses at Alexandria already awarded to an amount exceeding £3,000,000 are unpaid, and the date of payment is unfixed. The Khedive and many of the highest officials are giving up part of their allowances to relieve the state burdens. Every legitimate effort is being made to increase the national resources. A stamp law is being introduced for the first time. European house property is to be taxed. Commercial treaties are being made which will liberate Egypt from its chain to the Turkish financial system, and, accompanied by customs reforms, discourage smuggling.

It will thus be seen that, in spite of the reluctance of England to assume the overt responsibility for the government of Egypt, yet, step by step, all the most crying evils of the country are being seriously and strenuously grappled with. The Board of Works, which, extending to the irrigation system, is scarcely second in importance to the Ministry of the Interior, is, together with the latter, in the hands of determined, competent, and practically despotic English officials of the highest repute. The "procureur-général" is an ex-English Indian judge. The Egyptian army, the constabulary, the Sudan, the prisons are severally in the hands of accomplished Englishmen, responsible more to the English Government at home than to the Egyptian Government at Cairo. In the meantime, the hand of Sir Evelyn Baring, Consul-General, is ubiquitous and incessantly active. The only difficulties come from the complication and indirectness of the governmental system, and from the slowness and too often the apathy, if not also the corruptibility, of the subordinate officials through whose hands all the work must pass. Time, education, and more favorable political conditions will alone cure this. A.

Correspondence.

ASSESSMENT, REAL AND PERSONAL.

To the Editor of The Nation:

Sir: The suggestions of Mr. Tiedeman in your No. 972, on the method of state taxation, are theoretically in the direction of justice, but utterly impracticable. Within the territorial limits of the authority of any assessor it would be impossible to ascertain the proportions that the average incomes from real and personal property bear to each other, upon any practicable system. Except in large cities, the great bulk of real estate consists of farm lands, the income from which depends upon so many contingencies that it is a most fluctuating and uncertain quantity. It requires skill, labor, rain, and sunshine, in due quantity and season, to realize a large income. The *assessment* is made before the extent of either of these factors of success can possibly be known.

But your correspondent, after starting downward, stopped short of the bottom of the subject. The real difficulty lies in the practical maladministration by the assessors of approximately just laws. The law requires *all* taxable property to be assessed, we will suppose, at its actual cash value. A owns a farm of one hundred acres, worth $5,000, and B has $5,000 cash, it may be idle in bank, or earning interest in the shape of bonds or notes. The farm of A is valued by the assessor at $1,500, or, possibly, $2,000, while the cash or notes of B (if assessed at all) are put down at a par valuation—$5,000. B sees the injustice of this method, and, if he can evade or *will* evade, he *does* evade taxation in whole or part. That the case supposed fairly represents the facts, is beyond dispute in this country. The real difficulty is in getting just assessments. The courts in the Western States hold such assessments void, when the question comes before them; but, generally, people who are assessed unjustly prefer to pay rather than litigate. If the people would see to it that the laws are even tolerably executed, we should not hear so much clamor for more legislation.

J. P. Strother.

Marshall, Mo., February, 1884.

COÖPERATIVE BANKS.

To the Editor of The Nation:

Sir: At the request of several gentlemen, I venture, with your permission, to answer briefly the query of Emma G. Shaw in No. 972 of the *Nation* regarding Coöperative Loan and Building Associations. The kind of coöperation attempted by these banks is not that which strives for a visionary or unnatural end. It is found that people will save with the opportunity and *the motive* before them, and a sufficient motive exists in the desire to have a home of one's own. These banks coöperate to bring the opportunity and the motive near together. Through them the small savings of many are *regularly* combined into large ones and at once invested in homesteads.

About thirty of these banks are at present in operation in Massachusetts under a carefully considered statute. The men whose influence placed this upon the statute book are a sufficient guarantee that it was done advisedly. The Savings Bank Commissioners have a general supervision over these banks, while each is immediately cared for by a board of directors elected annually in open meeting by the stockholders or investors from their own number. These directors are men of business experience, who give, without other compensation than that found in the work, a few hours each month to making the loans and conducting the business. Those who invest must do so *regularly*. They can see the money loaned, know the character of the borrower and the genuineness of the security. They are thus taught the simple but sturdy ways of prosperity. The thrifty are helped on and the thriftless quickened by example. The present prosperity of these banks is unquestioned. A monument to their past may be seen in Philadelphia. The question of their future in Boston and elsewhere depends solely upon whether there will be a succession of able, honest men, who will give the necessary time and experience to their safe management, for the mere sake of doing good. On the assumption that this kind of altruism may be depended upon as a constant quantity, no better way can be devised for the investment of small sums. A complete idea of the work of these banks in detail can be obtained by attending their public meetings or consulting their officers.

Yours very truly, Walter C. Frost.

Newton, Mass., February 25, 1884.

A PSEUDO-BENJAMIN.

To the Editor of The Nation:

Sir: In speculating on the authorship of the Thurlow-Weed-Barnes-Benjamin letter, you suggest that the signature "Benjamin" is the only reason which has ever existed for supposing that Mr. Judah P. Benjamin wrote the letter. I know from personal experience that there were pseudo-Benjamins in those days. I happened to be temporarily in Richmond, Va., in April, 1861. I left it the day after the attack made on the Union troops while passing through Baltimore. An order had been issued by Governor Letcher that no one should leave Richmond by railroad without a passport. Compliance with this order delayed the departure of the train, so that when it reached Gordonsville *en route* to Alexandria, the connecting train had taken its departure, and a detention of two or three hours occurred in consequence. While we were halting at the station it was announced that Mr. Benjamin, of the Confederate Cabinet, was one of our fellow-passengers. Under the veranda of the building an individual obviously of Hebrew extraction, shabbily dressed, and of commonplace appearance, was attracting much attention from a throng of spectators around him. Presently a tall and portly gentleman clad in black broadcloth approached him, and, laying his hand on his shoulder, addressed him thus: "I understand, sir, that you represent yourself to be Mr. Benjamin, of the Confederate Cabinet. I know Mr. Benjamin well. I have seen him hundreds of times, and have had intimate personal relations with him. You are as much unlike him as one human being can be unlike another. You are either crazy or you are an impostor."

The pseudo-Benjamin made no reply. I heard a few minutes later that he had been arrested by the "home-guard" as a suspicious person, and that his case was to be publicly investigated forthwith. He was taken into the shed of the station, whither the crowd of loiterers soon followed him. Several exciting harangues were made by various distinguished local orators, and the rule was formulated that a man who would lie would commit any crime—treason, for example. "Mr. Benjamin," however, did not appear to be at all alarmed. "What," said he, "do you want? My life? Take it." But no one appeared to be capable of such an exercise of executive vigor as would have been implied in the summary execution of this traitor *in posse*, whose offence probably consisted in the fact that, being of the tribe of Benjamin, he was quite willing to confirm rather than correct the

erroneous impression that any one might entertain of his identity with the Confederate statesman.

Mr. Benjamin and baggage were (quite unnecessarily) searched; he took the evening train with us to Alexandria, and the next day, while walking through the streets of Baltimore, I saw him standing beside a clothing store, of which he was probably the proprietor.

I offer the above as a *mémoire pour servir* toward the discovery of the writer of the T. W. Barnes letter. B.

San Francisco, February 16.

THE FLOODS AND THEIR CAUSES.

To the Editor of The Nation:

Sir: Man's efforts to modify the action of nature's laws—to avail himself of them in the promotion of his own objects, or to run counter to them in the execution of his projects—are always attended with danger, and should never be ventured upon without careful consideration of the risks involved in their prosecution. The penalty may be so remote, and dependent upon such contingencies, that the connection between effect and cause is not immediately apparent, but is none the less inevitable when the contingency arises. The disastrous and unprecedented floods which of late years have prevailed in the valley of the Ohio, and especially in the States of Ohio, Indiana, and Illinois, are directly traceable to man's agency, and especially to two distinct causes, both of which illustrate the truth of the above assertion.

One of these, the removal of the forests, has been fully and freely explained and commented upon, in the *Nation* and other papers, and is so well understood as to require no further remark, except the significant one, that although it may justly be cited as one of the undeniable causes, both of floods and droughts, there has yet been no such recent extended increase of forest-clearing as would suffice to account for the sudden and vast increase of the annual floods. For this we must seek another cause, and I submit the following facts, which have come directly under my own observation, as a sufficient explanation:

In conversation eight years ago (in 1876) with the Superintendent of one of the principal railroads in this State, he told me that the receipts for freight of grain on his road the previous year had fallen more than a million dollars below the average, solely on account of its having been a wet season, the effect of which might have been averted by proper drainage, if the farmers could only be induced to try it. After some conversation I suggested the preparation of a pamphlet or tract, setting forth as succinctly as possible the benefits of under-drainage, with an explanation of the rationale of its operation, to be gratuitously distributed among the farmers. He approved the project and arranged with me to prepare the tract, which I proceeded to do, and backed all my assertions by such testimony as could not be denied. About twelve thousand copies of this tract were distributed by the railroad officials. It was immediately republished in full by agricultural papers, and also by tile manufacturers, who issued it as an advertising pamphlet, till I am assured that more than 100,000 copies were distributed.

The next year the Secretary of the State Agricultural Department informed me that, according to the returns from the different tile manufactories, the sales of drain tiles had been more than four times as much as in any previous year, and the benefit was so immediate and obvious that, from that time onward, the demand has exceeded the supply, though manufactories have been established wherever material of good quality was to be had; and last year he informed me that he had been unable to get full returns from all the factories, but it was certain that "more than *fifty thousand miles* of drain tiles had been laid in the State since 1876." I have every reason to believe that my pamphlet was largely instrumental in starting this great work, which has been fostered and promoted since by conventions, addresses, and periodicals devoted to the subject of drainage. The fever has raged throughout Indiana and Ohio with equal violence, and though I have no official report of the work done there, I feel confident I am safe in stating that in the three States more than 100,000 miles of tile have been laid. Now let us consider the effects.

The general surface of this whole region is so level that it abounds in swamps, sloughs, and areas of low, wet land, of greater or less extent. There is hardly a farm which has not more or less of such land, which heretofore has been useless, but which, when drained, has proved to be the most productive land on the farm. These areas, consequently, have been everywhere the first to be drained, to the immediate and manifest improvement of the productiveness of the farm, and equally of the health of its occupants. But, on the other hand, these areas have heretofore been the reservoirs into which the rains and melting snows of all the tributary surface have slowly found their way by infiltration; and after days and weeks, during which evaporation was constantly in progress, the surplus or overflow has reached the river. Now they have been provided with artificial substitutes for nature's slow methods, and the immediate discharge is secured of all these natural reservoirs through the drains, which carry off in a few hours an accession of waters that would otherwise have reached the river only by comparatively small instalments, after percolating for weeks, or perhaps months, through sloughs and swamps, and losing a large portion by evaporation. This effect is perfectly obvious and undeniable; and, taking into account the almost incredible extent to which this work of drainage has been carried, is the result disproportionate to the cause?

But the work cannot be undone; in fact, its ratio of increase was probably never greater than now, for no one now doubts that underdrainage is the safest investment the farmer can make, and it has already added millions to the productive power of this State. Are the floods, then, to be accepted as a chronic evil? Or by what means can they be averted? Forest planting, or the construction of great artificial lakes, as was proposed, at the head of the Mississippi, to serve as reservoirs during the droughts which will be the necessary consequence of the floods, would seem to be the only artificial means of compensation for the violation of nature's laws of which we may consider ourselves convicted. Whether either remedy is practicable to a sufficient extent to be of service, is doubtful. It seems evident that for a long time to come the areas on the river shores which are subject to the floods will have to be abandoned to such uses only as are not liable to injury from that source.

H. W. S. Cleveland.

Chicago, February 13, 1884.

THE "PROTECTION" OF COPYRIGHT.

To the Editor of The Nation:

Sir: The Librarian of Congress recently expressed himself in favor of international copyright, not only because justice demands it, but because our literature languishes for want of it. The small number and average poor quality of American books is, he thinks, largely attributable to uncompensated British competition, and we are permitted to infer that a large increase of meritorious native works would be the result of protecting honest dealers in the raw material of literature against the venders of stolen goods. International copyright has hitherto been urged chiefly by authors who had obtained some recognition abroad, and who would therefore instantly profit by the passage of such a law. But the Librarian, who, *ex officio*, knows more of American literature, so called, than any one else, appears to have in mind not these, but the as yet mute and inglorious Miltons who would be fostered into fame by national "protection."

Now, this view is based upon two assumptions which I think are false: first, that the production of good books is proportional to the pecuniary reward; and, second, that it is affected by extra-national competition. The experience of France, Germany, and Great Britain, whose authors are "protected," seems to me to show that the reward of native authorship depends altogether (aside from intrinsic merit or the want of it) upon local habits; and the first proposition involves the fallacy that writing books is a profession like law or physic, or even journalism. The truth is that two-thirds of the writers of books are amateurs, in the sense that they write irrespective of pecuniary gain, and that a much larger proportion of valuable works are produced by them than by those who write, so to say, to order. If there were everywhere to be found a relatively large number of lawyers and doctors—a number including many of the first rank—who were willing to do their best for the pure love of professional renown, few would recommend the bar or medicine as a safe means of livelihood, but it does not follow that able work would not still be done in these professions. Besides this, the production of a professional man requires the expenditure of a considerable capital; while literary men, as such, simply grow. It is true that they depend upon the teachings of experience, as often as on genius or innate power of thought; but the experience is almost invariably acquired in some other pursuit than literature.

It is to be remembered, also, that the literary man has to contend against the competition not only of domestic cheap labor in his own trade, and of the unpaid labor of foreigners, but against the volunteer work of men in the real professions and trades. Lawyers and doctors are constantly writing books (besides those relating to their professions), but we do not hear of literary men cutting them out with *their* clients or patients; nor can it be doubted that the goodness of the works whose survival from the struggle shows them to have been the fittest, is largely dependent upon the number which enter into the contest, so that protection against foreign labor would not improve the quality, any more than it would increase the number, of our native products. Finally, the fact that we always have had a number of authors whose works have brought them in a comfortable living, though by no means to be urged as an argument against any attempt to secure to them a pecuniary interest in foreign editions, proves that the home market is at least sufficient for their needs. If foreign books were given away, there would still be people enough who would be willing to pay a fair price for native literature, not from patriotism, but simply because they prefer it.

The dependence of literary men for profits upon local conditions is illustrated in the constant complaints of German writers against circulating libraries. We have never heard complaints of this kind here, although we have not only lending libraries of the German type, but others which lend gratis. Nor are such complaints heard in England, where whole classes

of books, such as novels and popular histories, are published solely with reference to the libraries. In France books are published at a price much smaller than that of our copyright books, but considerably larger in proportion to the cost of manufacture; so that the publisher can afford to give a much greater percentage as royalty, while the sale is three or four to one of similar books in the other three countries named. In England, books intended for the libraries are offered at a price so large that, though only the libraries buy, the receipts are amply sufficient for both parties. But in Germany books are neither cheap enough for the public nor dear enough to afford a profit with only a small sale. If, as is asserted, the Germans could not be induced to buy books, as the French and as we do, to read and throw away, the obvious remedy is to adopt the English plan. Instead of this, however, ingenious expedients are proposed for taxing the libraries and refunding the amount collected to the author, something after the Canadian custom-house copyright—to state which, one would think, would demonstrate their absurdity. But the real ground for the failure of authors in Germany is, I fancy—first, the popularity of serial publications; and, second, the comparative worthlessness of German *literary* books. It is not cheap foreign labor, for both the reprinted English books and the translations from the French have to pay a royalty to the holders of the copyrights; in short, the German authors are protected quite as much as an international copyright would protect us.

W. M. G.

February 19, 1884.

Notes.

A LIMITED large-paper edition of the works of Edgar Allan Poe will, under arrangement with A. C. Armstrong & Son, who control the Poe copyrights, be issued in eight octavo volumes by G. P. Putnam's Sons, bearing the name of the Amontillado edition, and illustrated by etchings by Gifford, Church, Platt, and other artists. A portion of the 300 copies has been bespoken for the London market.

No. 19 of the Rhode Island Historical Tracts, published by Mr. S. S. Rider at Providence, will be Part 1 of Mr. W. E. Foster's paper on Stephen Hopkins. Part 2 is nearly completed.

Among the newest periodicals we remark the *Jurnal ov American Orthoepy* (No. 1, January, 1884), published in a peculiar phonetic character by C. W. Larison, at Ringos, N. J., and the *Foreign Eclectic* (No. 1, February, 1884), published by the proprietors in Philadelphia. The latter monthly takes its selections from French and German periodicals, and reproduces them in these languages without translation. The proof-reading seems careful.

A magazine of popular philology, printed in the reformed spelling of the British and American philological societies, and entitled *Language*, is projected by Profs. F. A. March, of Lafayette College, and C. P. G. Scott, of Columbia. A *Journal of Agricultural Science*, proposed by the North Carolina Agricultural Station, appears to meet with favor. A meeting to put the enterprise on its feet was held yesterday at Washington, at the Department of Agriculture.

For the sake of investigating the migration of birds, the American Ornithologists' Union have divided the country into thirteen districts, and prepared a circular for the instruction of observers, who will of course be voluntary. An additional number is desired, and the circular may be obtained by addressing Mr. C. Hart Merriam, Locust Grove, Lewis County, N. Y.

The historian of the immediate past has special claims on our gratitude, and Mr. Justin McCarthy's 'History of Our Own Times' (1837–1880) has proved a boon to thousands of readers and students. Such of these as were American must have wished that a similar summary view of the political development of their own country were available. Mr. McCarthy has now condensed his work into a compact duodecimo volume (as it appears in the Harper edition) of less than 500 pages, index included. In this shape it forms a really admirable text-book for our higher institutions of learning.

Mr. George Barnett Smith's 'Life and Speeches of John Bright,' now some three or four years old, might have been thought sufficient for the life-time of this distinguished statesman, but Mr. William Robertson and his publishers have thought otherwise, and we have an octavo volume of some 600 pages, entitled 'John Bright and His Times' (Cassell & Co.). It is distinctly a popular biography, inferior in literary quality to Mr. Smith's, but in general fuller of details, and of course adoing a large number of extracts from Mr. Bright's speeches. As books of reference neither quite excludes the other. An etched portrait accompanies the newer life.

The fifth and sixth volumes of the revised edition of Gardiner's 'History of England' cover in general the same ground as the two volumes of the original work entitled 'England under the Duke of Buckingham and Charles I,' extending from the return of the Prince from Spain in 1623 to the death of the Duke in 1628. During this period, the author says in his original preface, "Buckingham was the ruler of England." The ground covered, we say, is in general the same, and they end with the same event, the assassination of Buckingham, so that the six volumes now issued correspond precisely to the original six. But in the earlier volumes the correspondence is not precise, as the four first chapters of volume v. (chapters 43 to 46) belong to the earlier series, chapter 47 being chapter 1 of 'England under the Duke of Buckingham.' The work has been carefully revised; but, so far as we have compared the two, the changes are almost wholly in diction, and indeed the preface to each volume speaks of the alterations as being mainly verbal. The most important addition appears to be of about a page and a half (on p. 224 of vol. v.) describing the charges brought against Buckingham by the Spanish Minister Lafuente. These two volumes are of especial interest, as containing the history of the three first Parliaments of Charles I, the years in which the struggle was begun which, renewed after the eleven years of personal government, led at last to Charles's ruin. Mr. Gardiner's views with regard to this struggle are well known, and we do not find that in this revision they are changed in the least. Sympathizing heartily with the contest against prerogative, holding that the attitude of the Lower House was, "for the moment, the highest political virtue," he yet claims, in the words of his original preface, that it is now made clear how Wentworth "came to take service under the King without being an apostate." These original prefaces, by the way, we are sorry to miss from the new edition. Of course they could have no place in it in their present shape, but they afford so useful a key to the work that it is a pity their matter could not be incorporated in it in some shape. The recasting of the work has brought the two maps of Cadiz Harbor and the Isle of Rhé both into the sixth volume.

Mr. L. Toulmin Smith prints in the January *Antiquary* (J. W. Bouton) a letter written home by an English tourist in America during the operation of the Boston Port Bill (Sept. 7, 1774). Mr. Smith annotates it in a few particulars, but omits to point out a singular foreshadowing of the Concord fight of the following year. At New York it was newly reported that Boston had been bombarded on account of an émeute. "What gave rise to this, was said, was this: General Gage had ordered detachments of soldiers to seize the powder in a town some distance from Boston, whether the provincial powder or some secreted by the people I am not certain, which they did; but being opposed by the inhabitants in the carrying it away, they had fired, killed six and wounded others, and that this brought on the general uproar." The rumor was immediately contradicted, but not before an express had been sent off to Philadelphia, "and I suppose they would forward it still further southward."

The *Art Union* monthly for February comes late, but is none the less interesting as the mouthpiece of an organization of artists. It has a pleasant etching by Thomas Moran as frontispiece, and several process illustrations of the collection now in the gallery of the Art Union.

We mention elsewhere an important volume illustrating the material and political constitution of South Carolina. There is also on our table a very encouraging report of the first three years' experience of the Agricultural and Mechanical College of Mississippi. This institution, for whites exclusively (the State having provided a separate college for black students), has been more frequented than all but one or two of its class in the entire country, and has wisely established its agricultural teaching upon a firm basis before attempting the mechanical. It has practically become an experiment station for the farmers of Mississippi. Apparently the greatest obstacle to be overcome is the hereditary laziness of the students—their indisposition to labor; but it marks the great change which has come over the Southern mind when we find in the catalogue a large cut showing white youths marching afield with picks on their shoulders, with the legend, "Students going to work."

A correspondent directs our attention to what he considers striking resemblances between Mr. Charles Reade's story in the March *Harper*, entitled "The Picture," and a novel, "Where Shall He Find Her?" translated from the French and published by the American News Company in 1867.

Prof. Sheldon Amos's 'Systematic View of Jurisprudence,' published by Longmans in 1872, has just received the prize awarded by Dr. Swiney's trustees once in five years for the best treatise on jurisprudence. This prize consists of a silver cup worth £100, and the same amount in money.

The Juvenile Literature Committee of the Teachers' Union of Frankfort has found how difficult it is to lead youth in the way it should go with respect to reading. Formerly they contented themselves in their 'Ratgeber für Eltern, Lehrer, und Bibliotheksvorstände' with recommending good books. But they have become convinced that this is not enough, and in their last yearly issue they give a list of not-to-be-recommended books, but discreetly put these in an appendix. The National Teachers' Conference of Silesia has similarly issued a list of "geeignete und nicht geeignete Jugendschriften." As the persons to whom these lists are addressed are of age, they are not likely to be harmed.

The etchings by A. Lalauze, after the aquarelle illustrations of the works of Alfred de Musset drawn by Eugène Lami, have now all been issued by the publisher, Damascène Morgand. High praise is bestowed upon them by the *Revue Politique*, and higher still by A. Dumas *fils*, who was instrumental in having the etchings made, in a letter designed for a publisher's advertising puff,

With this writer's irresistible tendency to bathos, he says that "every woman in France who merits the name of woman keeps a volume of Musset under her pillow to dream upon," and draws from the Musset cult a great hope for the future of France.

Ex-Governor Leland Stanford of California, during a recent visit to Athens, placed in the hands of Mr. Eugene Schuyler, United States Minister to Greece, five hundred dollars, to be expended in the purchase of books for the library of the American School of Classical Studies at Athens. Gifts of the same sort from other of our public-spirited citizens would do much toward placing the library of our school on an equality with those of the German and French schools at the same place. The great need, however, as Professor Goodwin stated in his report as Director, is an ample endowment fund.

—Very interesting is the large volume entitled 'South Carolina,' just issued by the Commissioner of Agriculture of that State. As a picture of "resources and population, institutions and industries," it leaves little to be desired, and its freedom from exaggeration and grandiloquence is especially gratifying. We must pass over the description of the several belts or regions of the State, as to their geological formation, soil, productions, etc. The section on population naturally arrests attention. We read on page 369 that there is scarcely a township "in which one or more families (chiefly negroes) are not found, showing the distinct traces of the Indian descent which they claim. If such half-breeds numbered 6-10 of 1 per cent. of the present population, there would be as much Indian blood in South Carolina to-day as at the date of its settlement by the Europeans." As for the intermixture of blacks with whites, "it would be difficult to find an assured specimen of pure African blood" (page 373). There is no evidence of a tendency of the colored population "to separate from the aggregate population, and to become localized" (page 380). Nor do they confirm the old theory that they were not adapted to colder latitudes. "The Northern and Western non-slaveholding States had less than 6 per cent. of the negro population of 1860; but they have nearly 10 per cent. of the much larger negro population of 1880." The total number of the foreign-born in South Carolina is 7,686, which is 2,300 less than in 1860, despite the efforts made to encourage European immigration. In chapter iii. is given a sketch of the history, government, institutions, and laws of the State; in chapter iv. a sketch, occupying 100 pages, of education. Other chapters contain a large amount of useful information concerning churches, occupations, manufactures (under the head of cotton, we are told that from 1850 to 1882 the number of mills has increased 44 per cent.), transportation, taxation and debt, towns, etc. A large geological map of the State, and numerous graphic charts increase the value of this volume, which does infinite credit to Mr. Harry Hammond, its editor, and to the present Government of South Carolina. It ought to furnish a great stimulus to the best class of immigrants, both workers and capitalists.

—At the meeting of the American Philological Association in Cambridge, in 1882, Doctor Isaac H. Hall, of Philadelphia, read a paper on the Greek Testament as published in America, which excited very general interest among Biblical students, and, by opening to him new sources of information, increased considerably the quantity of his material. He has now issued it, enlarged and amended, in book-form, under the title: 'American Greek Testaments. A Critical Bibliography of the Greek New Testament as published in America. With two facsimile illustrations' (Philadelphia: Pickwick & Co., 1883). Dr. Hall is well fitted for the useful work he has undertaken. He is the possessor of the largest collection, private or public, of Greek New Testaments in America; he is exact in scholarship and unwearied in research, and he has had long practice in the study of Biblical texts. The field he has entered is almost entirely new. O'Callaghan's book on American Bibles (Albany, 1861) mentions only sixteen editions of the Greek Testament ('Amer. Gr. Test.,' p. 5), and no one, before Dr. Hall, had continued the investigation. The latter has worked up the subject in a very thorough way, not merely enumerating the various editions, but arranging them by families, tracing their genealogies, and unveiling the secret of their construction. There are few more curious sciences than bibliography, and even the history of American Greek Testaments has its humorous as well as its commercial side. In some cases, as, for example, that of the "Emphatic Diaglott" (p. 31), the reader will wish that the author had gone more into detail, as he has described (p. 36) the spurious Leusden which is so popular with theological students. His contributions to bibliography are not confined to American books; see, for instance, his remarks (p. 38, and note on p. 60) on Scrivener's noteworthy blunders. And, as the subject necessarily involves repeated reference to the early standard New Testament editions, the value of the book would be increased by a short introduction giving a sketch of the history of the Greek text. America has as yet produced no critical edition of the New Testament; but Dr. Hall points out that American scholars have not been behindhand in contributions to textual criticism: notably, Ezra Abbott, of Cambridge, and C. R. Gregory, now of Leipzig, have been zealous and successful students. One result of the examination of New Testament texts is to show on how slender a foundation the *textus receptus* rests, and Dr. Hall takes occasion to protest against the folly of clinging superstitiously to it, in opposition to the attempt that scholars are now making to establish the true text. At the close of the book is given a chronological list of Greek Testaments published in America. Altogether the author mentions about 150 entire New Testaments, and 108 partial editions; but he does not hope that his list is complete, and begs of all persons interested that they will communicate to him the titles of editions known to them, and omitted by him. This little book (82 pages) is a beginning in the right direction of Biblical critical research, and it is to be hoped that the author will continue his investigations, and that others will be stimulated to independent work in such material as is found in this country.

—The Principal of the Boston Correspondence School of New Testament Greek is undaunted by the recent discussion concerning the value of the study of Greek. He believes that "God has something personal and private to say to every man through His Hebrew and Greek Word," that "God has written some things in the New Testament for *your eye alone*." (The italics are the Principal's.) The school offers three courses. One of these is a "Kindergarten Course," with cards "to be used by little children in learning the Greek alphabet," with rhymes to teach the pronunciation of the letters. For example,

> "*Alpha*, the first of this twenty-four set,
> Rhymes with the first of the word *alpha*bet."

The letters are also set to music with "a simple refrain." A "Kindergarten game" introduces "to the children some of the queer animals of the Bible." Cards are prepared with a red Greek letter on one side and a black English letter with a key-number on the other. "For example, the children select all the black letters on which is the figure 8. There is one which is a capital. They place that first. There is one which contains a period. They place that last. The order of the other letters must be guessed. At length the word is arranged, BULLFROG. By this time the children are somewhat excited, and are perhaps surprised as well as pleased to learn that bullfrogs are mentioned in the Bible. But they are more excited at the prospect of seeing the Greek word and finding the place in the Bible where the frogs are mentioned." By turning the cards the children's curiosity is gratified; they see the Greek word βάτραχος. "Above all they are anxious to have the story about bullfrogs which mamma or Aunt Emma has been reading in the key ever since she saw the children take up the first letter with an 8 on it. This key contains explicit instructions, with answers to every question which may arise during the game." How, in guessing at the order of the letters, the child is to make sure of putting the two λs in the right order and thus get βάτραχος and not βάρταχος, the circular does not tell us. The rapid progress which this system and school insure, is indicated by the fact that although there are but twelve lessons in the Kindergarten course, one of the things taught in it is announced as "8, a philological conception of New Testament Greek as God's chosen language for His words to man." The circular says that "nearly two hundred students are already successfully pursuing the courses of the school. . . . All are enthusiastic. There is not a cold student on the list."

—Dr. George Engelmann, a native of Frankfort-on-the-Main, died at his home in St. Louis on the 4th inst., after a short illness, and just as he had completed his seventy-fifth year. The oldest and most respected physician of his adopted city, Dr. Engelmann is best known to the scientific world as a systematic botanist of a high order. His publications are not numerous or voluminous; yet, judged by the standard of permanent value, they must be placed with the best work in American botany. The earliest appeared as long ago as 1832, when he printed at Frankfort, on the eve of his departure for the United States, an inaugural dissertation, 'De Antholysi Prodromus,' written in Latin, and illustrated with his own analytical drawings. His botanical studies, thus early begun, were continued without intermission up to within a few days of his death, which overtook him busy with his botanical correspondence and in suggesting and planning new work. Dr. Engelmann was a slow, careful, and thoroughly conscientious investigator, who has left little for successors in his chosen fields to gather. He studied only a few groups, and always such difficult ones as other botanists hesitated to attack; and years were often given to the study of a single genus before his critical mind allowed him to publish anything in regard to it. In this way he studied and elucidated North American Cuscuta, Juncus, Euphorbia, Quercus, Abies, Pinus, Vitis, Agave. The Cactaceæ occupied his attention for nearly thirty years. He described and figured the plants of this order collected by the different expeditions, public and private, which have explored the boundary region of the United States and Mexico, and was long everywhere considered the highest authority upon this family as well as upon the Pine, on which he published, a few years ago, an elaborate memoir. Such engrossing and difficult studies were carried on in the moments snatched from a large professional practice, to which he joined, too, careful and elaborate meteorological observations. These he conducted for more than forty years, publishing the results from time to time. At his death Dr.

Engelmann was one of the oldest, if not the oldest meteorologist in the country. To his zeal the St. Louis Academy of Science owes its origin and reputation. Always its firm supporter, he was its first president, serving it in that capacity at different times during many years. Dr. Engelmann is worthily succeeded in his professional practice by his son, an only child, Dr. George J. Engelmann.

—Upon the news of the death of the late Wendell Phillips, the London *Times* was ready with an obituary notice which well illustrates the penalty paid by the reading public for insisting on having such reviews served up hot. For example, they were told that the abolitionists, Mr. Phillips among them, "declared that the only way to effect the emancipation of the slaves was by dissolving the Union," whereas, in reality, they declared dissolution the only way to free the Northern conscience from the guilt of complicity in slaveholding. Then follows this extraordinary statement:

"Their agitation was in the first place directed far more against the maintenance of a single authority, which they considered to be a distinct infraction of the rights of each separate State than against the slave-owners themselves, although they hoped to strike the latter by destroying the former. When, however, they attained their best object by the capitulation of Richmond they found that they had contributed to solidify and strengthen that very Union which they had denounced so vehemently as 'an immoral bond.'"

This, if it means anything, implies that the abolitionists were nullificationists on purely constitutional grounds, without reference to slavery; and that "the capitulation of Richmond" was their own defeat. Of course the immorality of the "bond" (national slaveholding), was wiped out by that event, and the Union which remained was the Union they had always desired and never opposed. But worse befalls when the *Times* comes to speak of Mr. Phillips's Lovejoy speech at Faneuil Hall:

"His first speech that has been preserved was made at the end of 1837, in reference to the execution of a religious minister who had upheld the liberty of the Press in discussing the Constitution of the country. He appears on this occasion to have been impelled to speak by certain observations of the Attorney-General in favor of the sentence, and, interrupting the official pleader from the body of the hall, he had the personal satisfaction of carrying the mass of the audience with him."

From this the *Times's* readers will naturally infer that Lovejoy suffered judicial execution, in Massachusetts, and that Attorney-General Austin was appealing in behalf of the majesty of the law against popular outcry!

—The English translation of Professor J. J. Rein's 'Japan Travels and Researches' (A. C. Armstrong & Son) is before us, and those who have waited for the very best general work on Japan have now the opportunity of purchasing their full money's worth. Gathering the best of all previous scholarship and research on the subject, the author has added his own valuable contributions. With tireless German industry and enthusiasm, he improved every moment of two years' travel and residence in Japan during 1874 and 1875. As he was under the patronage of the German Government, numerous special facilities were afforded him, and the assistance of foreign scholars, notably that of Mr. Ernest Saton, was freely accorded. As we have before reviewed at length the German work, we here content ourselves with a brief note on the quality of the translation and bookmaking. The text before us is more than a translation, it is a revision of the original work, and hence an improvement upon it. Every line has passed under the eye of the author. We have marked a number of the sentences which gain decidedly in clearness and force by rearrangement of clauses and excision of superfluous or weak words. Slips in English grammar, however, occasionally occur, and in the use of pronouns one is needlessly burdened at times to discover lawful parentage. The original German term, as for instance, "cockade" for crest or badge, is sometimes left unimproved. These slight defects are, however, really few, as compared with the excellences of the work as a whole, which is better in its English than in its German dress. The publishers have done their part handsomely, and give us all the merits of the European edition. The paper is thick and white, of first quality, with fair margins, the page being by two dimensions a half inch larger than in the original German. For the 630 pages of the latter, we have 534 pages in the present edition, with all the superb illustrations, two large maps, and an index. We commend the work as the best general hand-book of Japan, and the most complete yet presented to the English-reading public.

—No scheme of city reconstruction nowadays can afford to omit subways; indeed, few try to. They are a prominent feature in the pamphlet which Mr. W. Westgarth has published as an explanation of the series of prizes offered by the Society of Arts for the most practical essays on (*a*) the "rehousing of the poorer classes of London," and (*b*) the "sanitation, street realignment, and reconstruction of the central or more crowded and insanitary parts of the City." Lighting, water, sewage, and, perhaps, heating and force should all pass through these subways, which would apparently fill the whole width of the street, and the adjoining cellars would be valuable for business storage. Ordinary traffic, and even rapid transit, could be provided for in the streets if a terraced promenade, having very many connections by bridges, were carried along the second floors. Steam power for locomotives does not meet Mr. Westgarth's approbation. Electricity, or at any rate some silent and smokeless motor, must be insisted upon. The buildings should be immensely lofty, and the upper stories reached by constantly moving elevators. The roofs, all on the same level, might be recreation promenades, parks, gardens. These, as Mr. Westgarth's reconstructed city is to have no smoke, would be delightful, and the upper stories of his new buildings might be sought as homes in the very heart of the city. We confess we do not see, even if the bold projector succeeded in devising means for cooking and heating without smoke, and so prevented his new City from producing London's great plague, how he could keep the smoke of the surrounding unregenerated districts from pouring in and clouding his skies. The whole of the City is to be laid out anew and rebuilt; an extraordinarily wide street to connect the Bank and St. Paul's, and all thoroughfares to radiate from those two foci. And this magnificent scheme he imagines could be carried out by a joint-stock company with a capital of only ten millions sterling, the present owners of property to have the option of coöperating with the company, and so retaining the property, or of giving it up to the company at a valuation. He is confident that the increased rents would pay the cost of the scheme. To prevent fear of misuse of the vast powers with which it would be necessary to intrust the company, it is provided that no step whatever shall be taken without the concurrence of the three representatives of the Government, the Municipality, and the Board of Works, who are to be members of the Managing Board; and he would have the other members of the Board to consist in large part of men of reputation in engineering, building, sanitary science, and the housing of the poor. The proposal seems at first sight wild, and likely to be rejected at once. But, conservative as John Bull is, he sometimes adopts very magnificent projects, and great waves of public opinion sometimes carry him to very unexpected decisions. All England is excited now over the cry of outcast London; it is a matter that comes much nearer home than the cry of Egypt cast out of the Sudan. It is not utterly beyond belief, therefore, that some Haussmannization, so to speak, may improve the English metropolis.

—In a recent work ('Zur naturwissenschaftlichen Behandlungsweise der Psychologie durch und für die Völkerkunde,' Berlin, 1883), Dr. A. Bastian points to the fact that the real principles of ethnology are of a psychological nature, and that to discover them the psychology of nations has to be treated as an inductive science, a science of nature. His volume contains seven treatises, averaging nearly forty pages each. The subjects are of paramount interest to ethnologists, and are illustrated throughout by the new discoveries made by the author himself in the most distant parts of the globe. They are as follows: "Psychology on an Ethnologic Basis"; "Scientific Controversies on Various Subjects"; "The Andaman Islands"; "From Polynesia"; "The Youth's Initiation at the Time of Puberty"; "Religious and Legal Customs"; "On Easter Island." The sketch of the Andaman Islands contains an abstract of a recent article published by E. A. Man in the Journal of the Anthropological Institute for August, 1882, enlarging on the anthropology, government, ordeals, laws, narcotics, adoption, relationships, and initiatory ceremonies of these cannibalistic islanders. In the sixth article, the Creation myth of the Iroquois is given *in extenso;* and a curious list of the Roman genii, male and female, is added, of whom a large portion presided over agricultural pursuits. The article on Easter Island and its mysterious statues is chiefly compiled from recent English publications. The superabundance of ethnographic material presented in this book is marred by many typographical errors, especially in Latin and Greek quotations; and Bastian's method of quoting authors by their names, without mentioning the volume and page, is anything but satisfactory.

—Mr. Theodore Thomas and his orchestra gave at Steinway Hall on Sunday afternoon the first of a series of concerts for the benefit of working people and their families. It is proposed to give one of these concerts every month, the tickets being distributed among a respectable class of people whose income and engagements do not allow them to attend high-class entertainments. The plan of giving these concerts was originated several years ago, and the execution of it was rendered possible through the generosity of the late Mr. Julius Hallgarten and the efforts of Dr. Felix Adler, Mr. Theodore Thomas, and several other gentlemen, among whom especial mention is due to Mr. Steinway, who has added the free use of the hall to his numerous previous donations in behalf of musical culture. The scheme is certainly an excellent one, the only objection that has been urged against it being that the concerts are free. But, as Dr. Adler remarked, this is an unreasonable objection, which would equally hold good in regard to public schools, free libraries, or banquets to which guests are invited. The arrangement of the programme was a matter which required especial tact and experience, and the result of the concert was a great triumph for Mr. Thomas over those who continually underrate the musical capacities of

audiences, including the Philharmonic. Mr. Thomas's principle has always been not to stoop down to the popular taste, but to elevate that taste to a higher level. Given such a rare opportunity to acquaint a large number of people with works of a high order, it would have been a waste of valuable material to play a number of trivial and flimsy pieces such as may be heard every evening for a "quarter" at one of our music halls. When art galleries are thrown open to the public, they are not invited to look at cheap chromos. On the same principle Beethoven's Fifth Symphony was boldly placed on Sunday's programme, and it is gratifying to record that it was listened to with more attention and received more enthusiastic applause than anything else, excepting Wagner's "Rienzi" overture, which ended the concert. This began with the Abert arrangement of a Bach prelude, chorale, and fugue, and included, besides the pieces mentioned, Mendelssohn's overture to "Midsummer Night's Dream," Weber's Invitation to Dance, and two songs—Schumann's Two Grenadiers, and Schubert's "Am Meer," suitably orchestrated by Mr. Thomas—which were sung by Mr. Remmertz. The choice of Weber's waltz, as orchestrated by Berlioz, calls for special mention, as it gives fresh evidence of the spirit of liberality and common sense which gradually makes its way in this country. The time will come when the most bigoted people will recognize the fact that there is more true religion in a good waltz or polka than in a wretched hymn. Genius is always sacred, no matter whether it manifests itself in quick or slow rhythm.

SCHLIEMANN'S TROJA.—II.

Troja: Results of the Latest Researches and Discoveries on the Site of Homer's Troy, and in the Heroic Tumuli and other Sites, made in the year 1882; and a Narrative of a Journey in the Troad in 1881. By Dr. Henry Schliemann, Hon. D. C. L., Oxon., etc. Preface by Professor A. H. Sayce. With 150 woodcuts, and 4 Maps and Plans. London: John Murray; New York: Harper & Brothers. 1884. Pp. xl.-434.

THE second city is the only settlement on Hissarlik, except the topmost one, for which the ground was levelled above the ruins of the preceding town before erecting new buildings. The settlers here raised the ground above the sloping débris of the first town by a layer of earth ten feet deep on the north and twenty inches deep on the south, and they built stone foundations for their large buildings through this new layer upon the more solid ground beneath it. The acropolis was fortified by a substantial stone wall, which is to be seen on the south and southwest sides. "It consists of quarry stones, on an average 0.45 m. long by 0.25 m. broad, which are somewhat irregularly joined in easily recognizable horizontal courses, without any binding material" ('Troja,' p. 54). The woodcut on page 55 gives a good view of a piece of this wall adjoining the southwest gateway on the west. "Here it is built at an ascending angle of 60 degrees; it has a slanting height of 9 m. and a perpendicular height of 7.50 m." (p. 56). Another piece of the same wall on the north side of the hill was destroyed by the great central trench in 1873. Another wall, which Schliemann assigns to a later period of the city, runs from the southwest gate, at first parallel with the older wall, then outside of it, and afterwards by itself on the southeast side of the acropolis, finally reappearing at the northeast angle, where it is nearly joined by a piece of wall supposed by Schliemann to be the beginning of the enclosure of the lower city on the plateau. These walls were built with towers, which stood at regular intervals of about 50 metres. The older wall, as it now stands, is built entirely of stone, and it is uncertain how its upper part was constructed (p. 54); the later wall has a foundation of stone and a superstructure of brick. Dr. Schliemann seems to think that the whole acropolis was at one time surrounded by a wall of this later style. He says (p. 61): "When the whole wall of the acropolis was still entire, and when the gigantic substruction wall was still surmounted by the brick wall crowned with numerous towers, it must have had a very imposing aspect, particularly on the high north side which faces the Hellespont; and this may have induced the Trojans to ascribe its construction to Poseidon, or to Poseidon and Apollo." The acropolis had three gates, one on the southeast, one on the southwest, and a third on the south. There may have been others in parts of the wall which are not now visible. When the level ground of the acropolis of the second city was laid bare by removing the houses of the third, it was evident that only a few large buildings of the second had occupied the hill, such as were likely to be found in the citadel of a great town. There were two which appear to be temples, described with plans and measurements in pp. 76–87. The larger of these was about 43 feet in breadth, and about 112 feet in length to the edge of the great trench, by which a part of its foundations were cut off. It contains a *naos* and a *pronaos*, the latter open to the southeast; it may have had another chamber behind the *naos*, where it is cut off by the trench. The smaller temple, which was about 76 feet long and 23 feet wide, had such a third chamber. Some pieces of the temple walls are still standing with a height of four or five feet, their thickness (4½ feet in one temple and 3½ feet in the other) having protected them; but they were all buried under the masses of rubbish upon which the third settlers built their houses. There were probably three other buildings within the wall of the acropolis, one of which seems to have been a large dwelling-house. Of the last Dr. Schliemann says (p. 89): "We recognize with certainty that it consisted of several halls, from five to seven metres long and broad, which were grouped around an interior rectangular central hall or court, 11m. long by 7 50m. broad." In removing the houses of the third settlement the largest one, which had been called the "Town Chief's Mansion," was wisely left as it was found, as a specimen of the poor architecture of the later town in contrast with the more substantial character of the earlier buildings.
